of diversity to demonstrate how demographic categories and identities are not to be seen as static and fixed, but as social constructs under constant redefinition, influenced by competing discourses and existing structures of power, and as varying according to the national/societal setting (Holck 2016; Knoppers et al. 2014; Van Laer and Janssens 2011; Zanoni and Janssens 2004). The quest that underpins much critical diversity literature is to bring back in the question of *social justice*. This is done to "unmask" power dynamics by illustrating how diversity management is a managerial practice of control by defining minority employees in fixed, essential groups with negative connotations (see also Boogaard and Roggeband 2010; Ghorashi and Sabelis 2013; Holck and Muhr 2016, forthcoming; Janssens and Zanoni 2014; Litvin 1997, 2002; Muhr and Salem 2013; Muhr and Sullivan 2013; Noon 2007; Roberson 2006; Roberson and Stevens 2006; Simon and Oakes 2006; Tatli and Özbilgin 2012; Zanoni et al. 2010; Özbilgin and Tatli 2011). Once categorized in essentialist stereotypical categories they are then more easily controlled and managed.

The two directions within diversity research point to how the act of intervening to craft a more egalitarian organization is navigating between the "Scylla and Charybdis" of, on the one hand, the use of essentialist "stereotypical" demographic categories and, on the other hand, individualistic, depoliticized categories (Tomlinson and Schwabenland 2010; Noon 2007; Kamp and Hagedorn-Rasmussen 2004). In practice this has led to an oscillation between "colorblind" diversity policies in the quest to overcome resistance and then "identity conscious" to further social justice (Holck et al. 2016; Tran et al. 2010). As Ghorashi and Sabelis (2013) argue, without the recognition of salient differences that *matters in the context* organizational policies for change become too diffuse to tackle the sources of exclusion requiring urgent attention: While target group policies like AA and EEO make historically disadvantaged groups seem as "absolute others who needed to be helped and accommodated," then the more individualized diversity management policies render them "invisible altogether" (Ibid. 83). This highlights the difficulties of finding an adequate balanced method for the attention to a specific diversity category and yet avoiding the fixation.

## The Management of Diversity Management

Scholars and practitioners seldom contest the importance of diversity in organizations any more (Benschop et al. 2015), and the management of differences is now commonly perceived in the corporate environment as a part of human resource management and leadership development (Holck et al. 2016). However, how to achieve the organizational change that is needed to transform organizations into more inclusive and diverse workplaces has proven to be much less obvious. Organizational processes are complex and difficult to change and although different strategies for change have been developed for diversity in general (Dobbin et al. 2011) and gender in particular (Benschop and Verloo 2011), we still lack knowledge of which practices have proven most effective in different settings and contexts. Diversity management practices refer to formalized practices developed and implemented by organizations to manage diversity effectively (Yang and Konrad 2011).

The HR diversity management practices advanced in the scientific and management literature emphasize the importance of understanding and intervention for reducing or eliminating bias and discrimination in heterogeneous workplaces. This research is characterized by the noble intent for all organizational members to benefit from differences by maximizing inclusion, feelings of fairness, and equality (Bendick Jr et al. 2010; Holck et al. 2016; Ortlieb and Sieben 2014; Shore et al. 2011; Tatli and Özbilgin 2012). The field of diversity management is dominated by a social-psychological approach that stems from research on organizational behavior. This line of research assumes that negative in-group/out-group dynamics are the product of majority individuals' biased cognitive processes and stereotyping, which can be corrected and limited through formalized HRM practices (Janssens and Zanoni 2014; Jonsen et al. 2013; Mamman et al. 2012;

Qin et al. 2014; Verbeek and Groeneveld 2012; Williams and Mavin 2014). Within this tradition, HRM activities include three main types of practices. The first are *objective procedures* and pre-specified criteria for selection, promotion, and lay-off decisions; performance appraisals; and pay structures. Objective and neutral procedures are believed to restrict ethnic majority decision makers' discretion and prevent cognitive biases from shaping allocation and reward decisions (Kalev et al. 2006; Shore et al. 2011). The second practice is *training*, which aims to familiarize employees with anti-discrimination law, ensure behavioral changes, and increase cross-cultural awareness and communication (Dobbin et al. 2011; Qin et al. 2014). The third set of activities is *network and mentoring*, which are designed to counter the social isolation that minorities experience as a result of homogeneity (Janssens and Zanoni 2014; Shore et al. 2011).

However, according to critical diversity scholars, these widespread HRM practices of diversity management have generally proved insufficient. In fact, little empirical evidence supports their ability to foster workplace equality (Dobbin et al. 2011; Holvino and Kamp 2009; Janssens and Zanoni 2014; Oswick and Noon 2014). One line of critique is that HRM diversity practices are "premature" or based on trial-and-error processes rather than scientific knowledge. Another line of critique suggests that the inadequacy results from the targeting of cognition rather than the structural dimensions of privilege, domination, and disadvantage (Ashcraft 2012; Oswick and Noon 2014; Zanoni et al. 2010). These critics suggest that such practices might even backfire, resulting in stereotyping and remarginalization (Kalev et al. 2006). Along these lines of critique, critical diversity research has applied a more discursive lens, aimed at exposing how larger societal discourses regarding e.g., gender, sexuality, or race/ethnicity obstruct organizational diversity initiatives (e.g., Christiansen and Just 2012; Klarsfeld et al. 2012; Muhr 2011; Muhr and Salem 2013; Oswick and Noon 2014). Critical scholars try to redress structural inequalities and perform a vital role in documenting the persistence of status inequalities in the workplace as well as in society at large. Here, diversity management is deconstructed as being a utilitarian and managerial rhetoric, serving in the upkeep of said inequality. This presents an important critique, but at the same time often refrains from engaging with practitioners to provide solutions, thus failing to obtain the desired change (Ahonen et al. 2014; Jack et al. 2011; Van Laer and Janssens 2011).

The prominence of decontextualized, abstract, and generalized perspectives mainly informed by sociopsychological insights helps explain why diversity research is generally viewed as unaccommodating to diversity practitioners (Ariss et al. 2012; Jonsen et al. 2013; Jack and Lorbiecki 2007; Muhr 2011; Oswick and Noon 2014; Zanoni et al. 2010). In a comprehensive literature review on diversity research, Jonsen et al. (2011) identify how most diversity research has been carried out in controlled, cross-sectional environments and has introduced artificial situations. These include, for example, lab studies using student samples (e.g., Stahl et al. 2010). Ivancevich and Gilbert (2000) report how most researchers remain outside the organizational flow and activities and instead rely on archival data, surveys, and secondary databases as primary data sources. This kind of research ends up making too broad assumptions that do not capture the complexities or the fabric of organizational life.

The prevalence of a prescriptive diversity management or an abstract critical diversity research unified in a nonsituated approach also brings along a general paucity of empirical research based on experimentation and improvisational use of active participative methods with relevant implications for practitioners. In particular, critical diversity research has thus far failed to articulate practical implications despite the crucial role played by practitioners in designing, implementing, and monitoring diversity policies and practices (for exceptions, see Ahmed 2007; Boxenbaum 2006; Janssens and Zanoni 2014; Ortlieb and Sieben 2013; Tatli 2011; Tatli and Özbilgin 2009). However, this distancing or disdain for management as a practice may result in a reluctance to take a strong stance or undertake empirical experiments. Indeed, while critical work has considerably enriched debates about

diversity and inequality in organizations, such scholarship must directly engage with practice if it is to fulfill its emancipatory aspirations (Hartmann 2014; Holck et al. 2016; King and Learmonth 2015; Spicer et al. 2009; Wickert and Schaefer 2015).

## Conclusion

This entry has focused on the concepts of diversity and diversity management, their definitions, historical context, theoretical debates, and practical uses. Diversity management as a concept has its historical roots in USA and the focus on affirmative action and equal employment opportunities. This has meant that diversity management historically has come out of a focus on rights (employee rights, human rights, equal rights etc.), which despite different explicit focus today still shapes the way it is theorized and practiced. Rather than affirmative action or equal employee rights, today's debates about diversity management seem centered around the two "new" poles in diversity management: the business case argument and the social justice argument. One finding justification for diversity management programs in economic reasoning, the other in ethical and moral reasoning. Besides outlining these poles in the debate, this entry has also shown how two different academic approaches to diversity management – one rational and positivistic and often referred to as mainstream, the other critical and constructivist in its approach – seem to divide the literature in two camps. As we have tried to show here, however, rather than one being right and the other being wrong, these two "camps" in the literature can be used for different methodological purposes and thus also holds different possibilities when it comes to the management of diversity management. Here our point is again not to take sides but to emphasize the importance for scholars as well as practitioners to understand the consequences, which such differences have for the choice of approach, and to provide the theoretical basis for scholars as well as practitioners to make such choices in an informed way.

# Diversity and Representation in South Korea

Sun Young Kim
School of Public and International Affairs, The University of Georgia, Athens, GA, USA

## Synonyms

Diversity management; Inclusion; Representative bureaucracy

## Definitions

Diversity: How an organization or a workgroup is composed of individuals from different backgrounds in terms of observable (e.g., gender, race/ethnicity, age) and underlying attributes (e.g., skills, values, perspectives)

Representation: Whether a bureaucracy reflects the overall composition of the general population it serves with respect to demographic

and socioeconomic characteristics (e.g., race/ethnicity, gender, social class)

## Introduction

Building and cultivating a diverse workforce is a crucial part of public personnel administration. With the increasing pressure to eliminate discrimination against disadvantaged groups and provide them with fair and equal opportunities for employment, many governments around the world have developed and implemented policies and programs aimed at enhancing diversity and representation in the public sector. A series of policies for representative bureaucracy in South Korea, which is collectively known as balanced public personnel policies, is one example of such efforts to actively hire and promote members of minority groups who have been relatively underrepresented in the civil service and to reflect their interests and opinions in policymaking and administration. This entry reviews the South Korean government's policy initiatives for representative bureaucracy and describes the content and implementation of balanced public personnel policies.

## Representative Bureaucracy in South Korea

Historically, public personnel practices in South Korea relied heavily on nepotism and favoritism based on kinship, regionalism, and school ties to reinforce power and authority of the ruling class. The prevalence of such practices inevitably resulted in severe discrimination against and unequal treatment of underprivileged groups in the civil service. In the development of modern bureaucracy, merit principles have become influential in establishing and instituting public personnel policies. Under this system, public officials are hired, appointed, and promoted based on individual qualifications, abilities, and achievements through open competitive examinations and objective performance appraisals.

While the merit system is believed to safeguard the fairness and impartiality of administration and help establish skilled career civil servants (Newland 1976), merit-based practices have weaknesses in providing equal opportunities to all members of society. For minority groups, open competitive examinations often act as a barrier to entering the civil service. These groups tend to be underrepresented, and thus, their opinions and perspectives are not adequately reflected in government affairs. When talent is selected only for their achievement and ability, those who have had limited opportunities for education or are in adverse situations compete under unfair circumstances and are further alienated from the civil service, making the bureaucracy more exclusive and dominated by certain elite groups or classes.

The notion of representative bureaucracy has emerged, in part, to overcome the limitations of the merit system and improve the responsiveness and representation of public officials. It also has been the theoretical foundation for the adoption of balanced public personnel policies in South Korea. According to this theory, a public workforce that mirrors the overall composition of society, in terms of demographic and socioeconomic attributes, can effectively reflect the collective interests of the people they represent because public officials and citizens share similar values, attitudes, and life experiences (Meier and Nigro 1976; Mosher 1968). All groups that make up a society should be represented reasonably in all areas, levels, and positions within the bureaucracy by their proportionate distribution in the population in order for them to have an impact on policymaking and implementation.

The theory posits that a simple reflection of the characteristics of the population, such as gender, race, and social class, in the configuration of the bureaucracy (i.e., passive representation) can lead public officials to actively advocate and represent the values, interests, and desires of the social groups to which they belong (i.e., active representation) (Meier 1993; Mosher 1968). This translation of passive representation to the active form occurs when power and discretion are delegated to public officials so they can respond more favorably to certain groups of their own (Meier 1993).

In South Korea, several plans have been developed in response to calls for a more representative government that recruits and hires people from

underprivileged segments. Balanced public personnel policies aim to ease the disparity between majority and minority groups and promote social equity and integration by eliminating long-standing discrimination against disadvantaged civil servants. They are also a means of increasing the public's satisfaction with the administration and the competitiveness of the government by providing administrative services that correspond to the values and interests of various social groups.

## Balanced Public Personnel Management

Balanced public personnel policies have been adopted and implemented since the 1990s. These policies refer to a set of initiatives to establish a public workforce in which different groups of people are adequately represented in proportion, and thus, have a broad scope that includes a variety of minority groups. The earliest set of programs was targeted at women and persons with disabilities, both of whom have historically experienced severe discrimination and had limited opportunities for employment in the civil service.

Such problems as regional inequalities, extreme income gaps, and discrimination against candidates with science and engineering degrees have arisen as persistent issues in South Korea. Beginning in the 2000s, balanced personnel policies have been introduced for local talent, low-income groups, and people with science and engineering backgrounds. More recently, programs aimed at newly emerging minority groups, such as North Korean defectors and multicultural families, have been established in an effort to respond to social and cultural changes facing Korean society.

It should be noted that racial conflicts have been less serious in South Korea than in other countries, such as the United States, because it is quite homogeneous in terms of race and ethnicity.

### Policies for Gender Equality

To increase the number of female public officials in the civil service, the government launched a recruitment plan in 1996, which aimed to hire a certain percentage of women among those who took national civil service examinations. The hiring target for female candidates was initially 10% in 1996, the year the policy was introduced, and increased to 30% in 2002 and afterward. While the original purpose was to expand female employment in government, the policy was modified in 2003 to include hiring targets for both men and women. The target was set at 30% for either gender in Grades 5, 7, and 9. (In the Korean civil service system, Grade 1 refers to the highest level and Grade 9 indicates the lowest level.) These policies are shown to have helped increase the employment of women in the government sector. In terms of quantity, the percentage of female public officials has steadily increased, from 38.8% in 2006 to 46.0% in 2017 (Ministry of Personnel Management [MPM] 2018).

Nevertheless, women are still substantially underrepresented in managerial positions that have the authority to make important policy-related decisions. As of 2017, the proportion of women in the senior civil service (i.e., Grade 3 or higher) was 6.5% while female public officials constituted 14.8% in Grade 4 or higher and 20.7% in Grade 5 or higher (MPM 2018). These figures were significantly low compared to the overall proportion of female employees in the government, which was 46.0% in 2017 (MPM 2018). They show that the policy has been effective in hiring more female employees in the civil service, but women have not been offered adequate opportunities to become involved in high-level policymaking processes. Plans have been established to expand the appointment of female public officials to managerial and executive positions, setting employment targets of 10% for the senior civil service and 21% for director-level positions at the headquarters (not including affiliated agencies) by 2022 (MPM 2018).

### Policies for Persons with Disabilities

In 1990, a plan was introduced to hire persons with disabilities through the civil service examination for Grade 9, which was later expanded to Grade 7 in 1996. These plans mandate that a certain percentage (approximately 6%) of the total new recruits in Grades 7 and 9 be individuals

with disabilities. In addition, a compulsory employment program for persons with disabilities has been enforced in the central and local governments since 2000. As of 2017, the compulsory employment target was 3.2%. The percentage of public officials with disabilities was 3.47% in the central government and 4.08% in the local governments in 2017, up from 3.20% and 3.78%, respectively, in 2011 (MPM 2018).

However, the majority of public officials with disabilities were employed in lower-level positions, with only 9.3% in Grade 5 or higher in 2017 (MPM 2018). Also, the employment rate of female public officials with disabilities was very low, suggesting the dual challenges posed to disabled women. Among the public officials with disabilities in the central government, 14.7% were female while 85.3% were male (MPM 2018). Since 2015, efforts have been made to provide disabled public employees with assistive devices and work support and to expand public awareness of disability discrimination.

### Policies for Local Talent

To reinforce regional representation in the civil service and promote balanced development across the nation, a hiring target for local talent was introduced for Grade 5 in 2007 and was expanded to Grade 7 in 2015. The targets were set at 20% of new recruits for Grade 5 and 30% for Grade 7. The average hiring rate of local talent was 7.7% for Grade 5 between 2007 and 2017 and 21.4% for Grade 7 between 2015 and 2017, indicating the targets have not been met (MPM 2018).

Another initiative, called the local talent recommendation program, is an internship-based employment plan. This policy was first adopted for Grade 6 in 2005 and was expanded to Grade 7 in 2010 and Grade 9 in 2012. According to this policy, graduates of local high schools and universities can be hired based on school recommendations and appointed for Grade 7 or Grade 9 after completing a certain period of internship (1 year for Grade 7 and 6 months for Grade 9). The number of local talents employed through the recommendation program increased from 80 to 120 for Grade 7 and from 104 to 170 for Grade 9 between 2012 and 2017 (MPM 2018).

### Policies for People with Science and Engineering Backgrounds

A plan for increasing the appointment of public officials with science and engineering backgrounds was introduced in 2004. In 2013, the hiring targets were set at 30% for senior civil servants and 40% for new recruits in Grade 5. The percentage of new employees with science and engineering backgrounds in Grade 5 was 40.6% in 2011 and 33.2% in 2017, and the percentage of senior civil servants with science and engineering backgrounds was 24.7% in 2011 and 20.8% in 2017, which shows a slight decline in the number of public officials with science and engineering backgrounds in high-level government positions (MPM 2018). However, the percentage of female public officials with science and engineering backgrounds has increased from 11.7% to 13.6% in Grade 4 or higher and from 6.3% to 9.8% in the senior civil service between 2015 and 2017 (MPM 2018).

### Other Balanced Public Personnel Policies

Plans have been introduced to recruit talent from low-income groups to alleviate economic and social disparity. An employment program for low-income groups was first established for Grade 9 in 2009. The initial hiring target was 1%, which increased to 2% in 2015. The number of new recruits from low-income groups was 13 in 2011 and 142 in 2017 (MPM 2018). In addition, there has been a growing need for accommodating newly emerging social minorities in the civil service, such as North Korean defectors and multicultural families. Development of recruiting and employment policies for these groups is still in progress. However, it is important to help people from these segments achieve economic independence and become involved in the policymaking process in order to deal with changing demographics, resolve increasing cultural conflicts, and promote social integration.

## Conclusion

Upholding diversity and representation in the civil service is one of the primary principles of public personnel administration in South Korea. The history of balanced public personnel management is relatively short, and the policies and programs

implemented thus far are fragmented and focused on achieving short-term hiring targets. While these policies have played a crucial role in improving overall representation of minority groups in the government, these groups are still underrepresented in high-level managerial and policymaking positions. Also, several social and cultural factors, such as widespread prejudice against minority groups, traditional gender roles, and rigid organizational culture and structure, hamper effective implementation of balanced personnel policies. The South Korean government continues to establish comprehensive and sustainable plans to build a more diverse and inclusive civil service that embraces members from a variety of social groups (MPM 2018).

# Diversity in Organizations

Katharine Leigh
Ball State University, Muncie, IN, USA

## Synonyms

Difference; Distinctiveness; Diversification; Variety

## Definition

Workforce diversity: is when organizations are composed of individuals with a wide range of characteristics and experiences. Some key characteristics are religious and political beliefs, gender, ethnicity, education, socioeconomic background, sexual orientation, and geographic location.

## Introduction

Organizations are composed of employees with different characteristics. Greater numbers or amounts of differences signify greater diversity. Key characteristics include, but are not limited to: religion, gender, ethnicity, and sexual orientation. These characteristics can impact whether a person is offered a job. They also can impact how a person is viewed in that job, including potential opportunities for advancement. Workforce diversity looks different depending on where in the world an organization is located. Diversity looks different in heterogeneous countries, such as the United States, versus more homogeneous countries, such as South Korea. Diversity also depends on the cultural characteristics of a country, such as political or religious background.

Advocates of workforce diversity promote its benefits for several reasons, including the business case and the social justice case. The business case believes that diversity could bring substantial benefits to the organization, such as better decision-making and improved problem-solving, greater creativity and innovation, and more successful marketing to different types of customers. The social justice case for workforce diversity believes that action is needed to create genuine equality, fairness, and respect among employees.

Workforce diversity is concerned with providing a safe work environment for all employees, combatting discrimination, and guaranteeing equal advancement opportunities. This can be accomplished with governmental legislation, such as affirmative action and equal employment opportunities policies in the United States.

Diversity can also be encouraged by organizational programs designed to create greater inclusion of all employees into informal social groups and formal company programs (Gilbert et al. 1999). Organizations that engage in diversity management are doing so voluntarily, unlike affirmative action policies (which are often mandatory). Diversity management can include: diversity training and sensitivity for managers and other employees, compensation equity, career development, human resource strategic planning, mentoring programs, on-site child care, and programs designed to promote gender equality (Gilbert et al. 1999).

Some diversity management programs focus on antiracism. Blatant racism is not seen often in the workplace anymore, but less overt forms can still be observed. One example of less overt racism would be passing over a qualified minority candidate, not because they are a minority but because they might not be a good "fit" (Hiranandani 2012). The antiracism approach views race and social differences as issue of power and equity, not of culture and ethnic variety. Also, antiracism believes that racism exists in ways that may be difficult for people in the majority to fully understand. As part of the antiracism approach, people with power need to examine their own experiences with unearned privilege. Antiracism initiatives can be uncomfortable to participate in, especially for people in positions of power, but it can be an effective way of building healthy organizations that are concerned with workforce diversity.

The success of diversity management in organizations is tied to leadership. Leaders need to not only provide vision but also enable the diversity managers who are actually implementing their policies (Tatli and Özbilgin 2009). Success of diversity management programs often depends on organizational culture and support from administration, thus making leadership a valuable part of the process. Leaders need to take into consideration that their employees come from many different cultures and characteristics. Managers will need to tailor their management strategies to the needs of both the groups involved and the individual personalities (Ling et al. 2013).

## Global Perspectives on Workforce Diversity

The rise of globalization has impacted workforce diversity. Although much of the professional literature on workforce diversity is written in western countries, in particular the United States, the issue impacts every geographic region. Individuals in other countries sometimes have the option of going to another country for employment. Perhaps there are not enough jobs available in their native country, or a different country might offer a better quality of life. Employers may also benefit from worker migration, since it increases the size of the working population, enriches the talent pool, and brings in new perspectives. Employers can also migrate, seeking more favorable economic conditions, new markets, less regulation, or lower taxes. In addition, multinational companies often have offices all over the world.

Workforce diversity is impacted significantly by the location of the organization. Diversity exists for a reason; not all countries share the same culture, economics, political situation, or religious background. Below are some examples of what workforce diversity looks like in three different parts of the world.

## Canada

Canada is adapting to a changing workforce. Large numbers of women have entered the workforce during the past few decades, increasing gender diversity. The number of residents that speak languages other than English or French has also increased. Severe labor shortages are expected during the next 10 years, due to retirements and low birth rates, which are expected to lower the ratio of workers for each retired person from 5:1 to about 2.5:1 (Hiranandani 2012). Bringing in foreign-born workers is a way for Canada to bolster their labor pool, adding to the Canadian economy, while also providing jobs to people who might have trouble finding work in their home countries.

In order to address the increase in diversity, Canada has adopted a policy of multiculturalism. Canadian multiculturalism stresses the importance of providing services in a variety of

languages, not just English and French, celebrating diversity, and challenging the traditional thoughts about dress code, food habits, accents, and other overt forms of prejudice (Hiranandani 2012). One way the Canadian government has tried to increase diversity is by passing the federal *Employment Equity Act* (*EEA*). The *EEA*, which was passed in 1986, is similar to affirmative action in the United States. It covers both the public sector and the private sector, including all businesses that have contracts with the Canadian government valued at more than $200,000. The *EEA* requires employers to try to reduce disparities in employment and workplace representation between four groups: women, visible minorities, aboriginal (i.e., indigenous) people, and people with disabilities. Visible minorities are defined as "persons, other than aboriginal peoples, who are non-Caucasian in race or non-white in colour." Employers are expected to reduce disparities in recruitment, such as creating job listings that will insure a diverse candidate pool. Employers are also expected to remove barriers, such as making buildings wheelchair accessible.

Despite these efforts by the Canadian government, multiculturalism and the *EEA* have not ended workplace discrimination. The unemployment rate is higher for visible minorities than it is for the rest of the population. Visible minorities are also underrepresented at the higher levels in business. Additionally, government funding for multicultural objectives has been lacking.

## China

China's workforce has undergone major fluctuations in the past 100 years. The government in socialist China controlled the labor market, mostly using geography as the determining factor. If a person lived in a rural area, they were not allowed to go to the city to get a job and vice versa. In the 1980s China opened up their restrictions between rural and urban areas, leading to massive urbanization. During this time many people employed by state-owned and collectively owned enterprises were laid off, due to downsizing in those areas. In response to the issues caused by internal migration, three major employment-related laws were introduced in 2008. The three laws were the *Labour Contract Law*, the *Employment Promotion Law*, and the *Labour Disputes Mediation and Arbitration Law*. These laws contain a number of articles against discrimination on grounds of age, gender, ethnicity, disability, and health status (Cooke 2012).

Diversity in the contemporary Chinese workforce can most often be seen in gender, age, and geographic diversity (i.e., rural versus urban and local versus nonlocal). Each of these types carries their own challenges. Women comprise of 37.6% of the workforce, but they are generally paid less and often receive few benefits (Cooke 2012). Also, women are underrepresented in certain areas, such as construction and government. When women are hired for government positions, they are often given administrative work, rather than positions of true power.

The age of an employee also impacts their position in China's workforce. A preferred age range is sometimes included in job advertisements. Older workers are often laid off first or forced into early retirement. Young workers also have challenges. Educational opportunities have expanded, but jobs have not always followed, leaving young people without experience in a vulnerable position. Many employers require at least 2 years of experience in their job listings.

Residential status is still important for Chinese workers, despite the easing of restrictions. The current system gives greater benefits to urban citizens than rural citizens and preference to local residents over nonlocal residents, with far-reaching effects in education, health care, social security, and employment opportunities (Cooke 2012). The nonlocal rural worker is at the lowest level and is therefore the most vulnerable to exploitation. They tend to work in areas with fewer regulations, like sweatshops, construction, and as domestics. They do not typically have contracts and have limited (or nonexistent) benefits. The government in China has tried to assist this group, but their conditions have not greatly improved.

## European Union

The European Union (EU) is concerned with promoting and protecting diversity. The EU has issued directives, including implementing the principle of equal treatment between persons irrespective of racial or ethnic origin, establishing a general framework for equal treatment in employment and occupation, and on the right of citizens of the Union and their family members to move and reside freely within the territory of the Member States. The European Commission (the executive arm of the European Union) issued a renewed commitment to diversity in 2008. The commitment stated that while some Member States have protected people outside the area of employment, protection is still needed against discrimination in the workplace.

Worker migration in the EU has had an impact on workforce diversity. The EU struggles with aging populations, labor shortages, pressures on social security systems, and decreasing competitiveness with foreign markets (Cerna 2013). One way to address these concerns is through finding highly skilled workers that are willing to immigrate. Migration within the EU itself is allowed, but has not been sufficient to solve all of their labor issues. Workers have started to arrive from other countries as well, especially from India and Africa (Barak 2005). When these workers move they inevitably bring their cultures with them, which can lead to tensions with some citizens of their host country.

Not all Member States support free migration within the EU. Free movement of citizens is a basic tenet in the EU. The resulting migration has disproportionately affected some countries, especially Germany and the United Kingdom (due to greater economic opportunities there). Citizens in the United Kingdom, especially England and Wales, were not happy about being forced to take migrants and voted to leave the EU in June 2016 (i.e., Brexit). Other member countries have complained as well, but still currently belong to the EU.

One way the EU has tried to work with Member States is with the Blue Card Directive. The Blue Card Directive was meant to attract highly skilled immigrants to the EU by approving an EU-wide work permit, allowing highly skilled non-EU citizens to work and live in most countries within the EU. This excludes several countries, including Denmark, Ireland, and the United Kingdom, who prefer to focus on their national policies to attract highly skilled immigrants (Cerna 2013). The requirements to earn a Blue Card stipulated that applicants must have a work contract (or binding job offer) with a salary of at least 1.5 times the average gross annual salary paid in the Member State, a valid travel document, and documents proving the relevant higher professional qualification (Cerna 2013). The worker may bring their family, and the permit can be approved for up to 3 years.

The Blue Card Directive has many variations to it, depending on the Member State. Some Member States have not yet adopted it at all, however. One reason for this is timing. The Directive was first proposed shortly before the global economic crisis of the late 2000s through early 2010s (i.e., the Great Recession). Politicians were pressured to protect the jobs of workers already in their countries, especially jobs belonging to residential citizens. The Blue Card does not promise work indefinitely, nor does it address integration and citizenship, but it can provide a foot in the door for highly skilled workers.

## Conclusion

There are many benefits to workforce diversity. Some organizations believe in the social justice aspect, others believe that it is good for business, and many believe that both are valid. The impact of workforce diversity varies from place to place. Some countries choose to recruit workers from other areas, while other countries strive to find the ideal balance for the workers they have. Every country has challenges for encouraging diversity and for addressing issues with minorities in the workplace. No country has "figured out" diversity, much less implemented it. Minorities still suffer discrimination, both in society and in the workplace. Organizations need to instill the good intentions of today into the workplace of tomorrow.

# Diversity in Public Personnel

Marla A. Parker and Ellen Shiau
Department of Political Science, California State University, Los Angeles, CA, USA

## Synonyms

Administrative discretion; Bureaucratic discretion; Cultural competency; Cultural identity; Discretionary power

## Introduction

As societies become increasingly culturally diverse, more revelations emerge about the complexity and nuances of cultural identity – particularly as it relates to how identity informs the formulation, implementation, and impact of policies by public (including quasi-public) organizations. More specifically, cultural identity has been strongly implicated in how the populace interacts with these organizations. Evidence substantiating this claim can be found in how the use, trust, and satisfaction of citizens with public goods and services can vary based on their race, gender, religion, citizenship status, and more. This requires public organizations to go beyond traditional conceptions of diversity typically used in public management for facilitating policy implementation. More public organizations should seek a culturally competent management approach that strategically builds their capabilities, structures, and environments in a way that considers how cultural identity influences organizational efficiency, effectiveness, and subsequent policy implementation (Norman-Major and Gooden 2015; Sabharwal et al. 2016).

The proceeding describes the role and importance of cultural competency in a specific and critical policy implementation tool: administrative (or bureaucratic) discretionary power. Essentially, this practice entails public sector workers engaging in relatively autonomous decision-making when performing mission-related tasks, typically in the context of direct service delivery to citizens seeking goods and services. The writing starts with a brief description detailing the important differences between diversity management and cultural competency. Then, it moves to a more detailed explanation of administrative discretion before describing the intersection of discretion and cultural competency. The writing ends with a discussion of management implications for applying cultural competency to effectively facilitating discretionary power.

## From Diversity Management to Cultural Competency in Public Administration

Diversity and diversity management in public organizations examines the management of heterogeneous workforces with the goal of capitalizing on the benefits diversity brings to an organization. Such benefits can include increased

productivity, organizational effectiveness, and creativity and innovation due to the varied perspectives, cultural knowledge, skills, and styles that a diverse workforce brings. Diversity management particularly examines strategies and practices that public organizations can utilize to support and benefit from a diverse workforce, including but not limited to recruitment and hiring practices, affirmative action, family leave policies, flexible work arrangements, antibias training, career advancement and development, and mentoring (Riccucci 2002); however, the linkages between diversity management practices and administrative discretion and organizational outcomes have not been explored as extensively.

Rather than just promoting tolerance, inclusion, and appreciation for cultural differences or aiming to increase the numbers of diverse public personnel, public agencies adopting cultural competency approaches to management and mission delivery acknowledge and manage for how cultural identity influences an organization's internal operations and subsequent policy implementation. More recently, concepts of cultural competency, which have been more prominent in the public health and social work fields, have been connected and applied to public administration. The concept is distinct from representative bureaucracy, diversity, and diversity management as it focuses on the attitudes, knowledge, and skills necessary to interact cross-culturally where different cultural identities can lead to different beliefs, understandings, practices, and behaviors.

Culturally competent organizations are thought to promote more effective, efficient, and equitable policy decision-making, implementation, and service delivery practices as public administrators adapt to understand and meet the needs of their constituents. Moreover, cultural competency also can apply to internal organizational management practices given that cultural differences can inform workplace dynamics among public administrators, such as work, communication, leadership, and conflict management styles. Thus, knowing how to understand, approach, and work with cultural differences among colleagues also can foster a more productive organizational environment.

## Administrative Discretion in Public Administration

The field of public administration has evolved to recognize the significant discretionary power that public administrators wield in policy decision-making, implementation, and service delivery. At one time, legislative directives were thought to provide clear demarcations regarding the allowable actions of public administrators; however, it is now widely recognized that public administrators often utilize discretion in the interpretation and execution of policies and programs given the variety and complexity of situations faced that often cannot be predicted (Lipsky 1980; Mazmanian and Sabatier 1989). For example, administrative agencies can develop and issue regulations to meet vague legislative mandates, determine when and how to enforce a policy, or settle stakeholder disputes involving public policies. In effect, public administrators exhibit legislative, executive, and judicial powers in operationalizing, implementing, and adjudicating public policies and programs. Given the degree of political power held by public administrators, questions then emerge regarding how to ensure the accountability of public administrators who are not subject to transparency and accountability mechanisms, such as public elections.

For example, following the emergence of the US civil rights movement and subsequent outbreaks of violence in the 1960s, in response to urban poverty and inequality in the delivery of services, greater attention was directed to the role that public administrators play in administrative decision-making and the shortcomings of public administrators in prioritizing social equity considerations in these decisions. In what became known as the Minnowbrook conference convened by public administration scholar Dwight Waldo in 1968, the value of social equity in policy decision-making, implementation, and service delivery was stressed as opposed to traditional emphases on efficiency and effectiveness. New Public Administration, which called for dismantling the systemic exclusion and discrimination of disadvantaged minorities, emerged as a response to the failures of public administrators in confronting social inequities (Frederickson 1971).

Another focus that emerged was on the role of street-level bureaucrats – public administrators, such as police officers, teachers, and welfare workers – who directly deliver public services and interact with the public, thus serving as important representatives of government to the public citizenry (Lipsky 1972, 1980). In the face of resource constraints and uncertainty, street-level bureaucrats who exercise significant discretion regarding policy implementation and service delivery can resort to simplifications to assist in making quick decisions; however, these "shorthand" rules can reflect cultural biases and stereotypes that result in discriminatory practices and damage to public perception of government institutions. Thus, confronting equity concerns in the context of administrative discretion aims to ensure effective and efficient policy decision-making, implementation, and service delivery, while promoting greater accountability among public administrators.

## Enhancing Administrative Discretionary Power with Cultural Competency

In the context of public sector human resource practices, to counter biases influencing administrative discretion, one dominant approach has been to seek a more representative bureaucracy, where the sociodemographic makeup of an organization more closely reflects the constituencies served (Kingsley 1944; Krislov 1974). This representation aims to reduce bias in decision-making while also enhancing public trust; however, a representative bureaucracy still may be insufficient to address bias in policy decision-making, implementation, and service delivery as public administrators still may harbor implicit biases that can vary along multiple dimensions of identity, such as race/ethnicity, gender, sexual orientation, religion, age, ability, or so forth.

Theories of representative bureaucracy also have evolved to focus on links between passive and active representation (Mosher 1968), particularly examining when and how public administrators actively advocate on behalf of a particular group as opposed to merely passively representing a constituency through shared sociodemographic characteristics. Growing recognition exists that public administrators can actively represent constituents in the policy decision-making, implementation, and service delivery regardless of whether public administrators share the sociodemographic identities of their constituents; however, active representation requires the ability of public administrators to foster a keen understanding of the interests and perspectives of that group. Cultural competency essentially facilitates active representation and can thus improve decision-making.

Rice (2007) developed what is essentially a comprehensive check list for public agencies seeking to enhance its cultural competency, which can inform better discretionary practices. First and foremost, street-level bureaucrats can improve their application of discretionary power by identifying their implicit bias, which can impact how they may treat constituents differently based on race, gender, ethnicity, religious status, and the like. Once these biases have been identified, it is imperative to address them by developing cultural knowledge and gaining more diverse experiences. Development of cultural knowledge does not only entail gaining specific information about specific cultural groups, but also understanding how cultural values and norms impact behaviors and perspectives. Moreover, developing cultural competency includes understanding how certain narratives (e.g., stereotypes) about cultural groups emerge that can influence perceptions of who is more or less deserving in terms of policy development and implementation. A good example of this can be seen with the Welfare Queen Experiment study by Gilliam (1999) where participants were found to have different views of how deserving black and white women were of government subsidized welfare.

Key to ensuring that cultural competency is properly integrated in discretionary power is evaluating outcomes from bureaucrat's behaviors, which can inform future decision-making and perhaps even provide checks for how discretionary power is used. Key targets should be the focus of continual evaluations. One evaluation target should be the extent to which discretionary

decisions have resulted in a pattern of disparate outcomes for constituents based on one or multiple cultural or demographic identifiers. Another target is how personnel are moving along a cultural competence continuum (Cross et al. 1989) where movement goes from cultural destructiveness to cultural proficiency. The idea is that as personnel move further towards cultural proficiency (which is enhanced by gaining cultural knowledge), public personnel will exhibit less bias in their decision-making. While examining constituent outcomes and location on the cultural competence continuum are not exhaustive measures, they are certainly significant.

## Conclusion: Managerial Implications for Developing Culturally Competent Discretionary Power

While discretionary decision-making power places more autonomy and authority in the hands of frontline public personnel, it does not comport with a laissez-faire managerial approach. Far from it, effective use of discretion emerges from appropriate managerial action that ensures personnel are effectively equipped and supported in decision-making. Given management's role in ensuring the fulfillment of the organizational mission, their role in guiding the use of discretionary action is even more imperative because such action can significantly influence how the public perceives the effectiveness, legitimacy, and value of a public organization. That being said, what substantive managerial actions should be taken to ensure that cultural competence is inculcated among frontline personnel, resulting in discretionary power that is not oppressive, but rather reflective of important public values of justice, equity, and equality? Furthermore, what barriers and opportunities exist for public managers as they aim to leverage the benefits of discretionary power while promoting cultural competency?

First, management should explicitly include cultural competence as part of the organization's strategic plan. This signals to personnel that this remains a priority for the organization and is critical to its mission, thus it should inform mission delivery. A potential challenge is overcoming resistance by personnel and even lower-level managers. The likelihood of this happening may be particularly high in areas where the public organization appears culturally homogenous or there is a general sentiment of anti-multiculturalism. Thus, managers should aim for buy-in by explaining how cultural competency can enhance effectiveness and ensure compliance with multiple ethical and legal requirements.

Second, focusing on human resource management functions can go a long way in preparing personnel to consistently use cultural competency in exercising discretion. As mentioned earlier in the description of diversity management, strides should be made to extensively train personnel in antibias training. However, cultural competency training goes further by helping personnel understand how cultural identity develops and interpreted in multiple contexts, which can lead to bias. Moreover, cultural competency training emphasizes the important skills of cross-cultural communication and emotional intelligence. Lastly, where possible, this training should build in opportunities for personnel to more substantively understand and connect with the constituents they serve. By emphasizing the role of training, management signals to personnel that cultural competence is a complex, valued skill that can be developed and honed. Structured training coupled with a strategic plan emphasizing cultural competence provides management with opportunities to formally evaluate its development and use by personnel. For example, cultural competency goals can be part of employee performance evaluations and communication channels can be established for use by constituents to report their experiences with personnel. Similar to implementing cultural competency as part of a strategic plan, implementation of training may also meet resistance.

The use of strategic planning, training, evaluations are but a few key mechanisms to promote cultural competency in administrative discretion. Additionally, how to implement these solutions will vary based on the realities the organizations. Nonetheless, success of these solutions at any organization will be strongly predicated on how

much managerial behavior and leadership creates an environment that supports cultural competency as a central organizational tenet. In other words, if public managers and leaders are to overcome the shortcomings of traditional diversity management, cultural competency must be promoted by them as a core value and not an ancillary function.

## Synonyms

Inclusion; Strategic planning; Workforce participation

## Definition

Veterans: individuals who served on active duty in the Armed Forces during specified time periods.

Individual with a disability: (defined by the Americans with Disability Act) a person who has a physical or mental impairment that substantially limits one or more major life activities, has a record of such an impairment, or is regarded as having such an impairment.

## Introduction

While diversity is commonly discussed in public administration literature, it is becoming increasingly important that the scope of this discussion expands beyond the usual categories of race, age, and gender. Diversity in employment is not only important in terms of societal representation, but has also been found to impact organizational performance and outcomes (Keiser et al. 2002; Meier et al. 2001; Meier and O'Toole 2002). Additionally, diversity is even more so an issue in continuing to have the best public workforce to serve citizens. The constant challenge of increasing diversity has been described as an ongoing issue

for public managers (Riccucci 2002). This is partly due to the ever-expanding designation of which groups, issues, and individuals are included in diversity issues. What constitutes diversity will expand as our community and country continue to change. In order to be the model employer for all organizations, public agencies must set the tone for diversity in employment (Berry 2010).

This chapter details efforts in enhancing diversity, in disability and veteran's employment, within the federal government. The diversity policies explored focus specifically on policies adopted during President Barak Obama's administration and their impact thereafter.

## Example of Promoting Diversity: Veterans' Preference

The Veterans' Preference Act of 1944 (included in the employment requirements of Title 5 and Title 38) affords veterans', who are disabled or who served on active duty in the Armed Forces during specified time periods, preferences over others in hiring and also in retention during reductions in force (U.S. Office of Personnel Management 2011). This practice dates back to the Civil War and continually resurfaces in society's debate about hiring preferences in the federal government. Veterans' preferences are in place to not only recognize the service of Veterans to the country but to help prevent economic loss when individuals try to enter or reenter federal employment. The general idea is to restore individuals who have served in the military to a competitive employment position and to illustrate the government's obligation to do so.

Diversity in this regard reaches beyond righting the wrongs of past discrimination and leveling the playing field for those that have served the country. It would appear that this was a simple justification to prevent individuals from being penalized for their time in military service and to help compensate them for the economic losses associated with serving the country. But instead it is part of a larger overall policy and long-term goal of creating a federal culture that values veterans' service, skills, and dedication (Berry 2010). The Office of Personnel Management (OPM) has stated that not only is veterans' employment the right thing to do it is a good business practice because of the significant resources given to military personnel during their training and time in service (2010). There is surely work left to be done in this area. The federal government is the nation's leading employer for veterans, but nearly 80% of all veterans are employed in three departments: Homeland Security, Veterans Affairs, and Department of Defense. Even if these departments are more conducive to the skills and services of veterans, if 80% of women or a particular ethnic group were concentrated in three departments, there would be an outcry that this is not meeting the levels of true diversity in the federal government.

The federal government has previously taken the appropriate actions to promote diversity throughout the entire federal workforce. This was the first time there is a strategic OPM plan focused directly on increasing the number of veterans hired throughout the Federal Civil Service (Berry 2010). Within the strategic plan, the commitment of leadership is the first goal. The strategies include creating a governance structure within the federal government to provide leadership and accountability for veteran's employment by creating advocates for veterans' employment within each federal agency (United States Office of Personnel and Management 2010). This strategic goal also includes indicators for progress. Beyond President Obama's executive order, all federal agencies are expected to have Veterans Employment Program Offices along with veteran's employment operational plans by specific dates.

President Obama signed Executive Order (EO) 13518 in November 2009. It sought to enhance the recruitment and promotion of employment opportunities for veterans within the executive branch (Obama 2009). Since the time of signing this order, there has been an increase of 2600 veterans hired over 2010. During this same period, the federal government has hired fewer people overall. Attention to issues involves holding federal agencies accountable to the timeline set forth in the executive order ensuring benchmarks

are reached. Making sure each agency has a written strategic plan and is putting the plan into action is the responsibility of human resource professionals. Many have already answered the question of why it's important to reflect the society that we serve. The Obama administration put the achievement of a more inclusive workforce into action. All agencies were required to submit a hiring plan to OPM by March 8, 2011, and were granted a one-time extension until April 11, 2011. Agencies were also required to designate a senior-level office to be accountable to enhancing employment opportunities for individuals with disabilities (Leonard 2011).

## Example of Promoting Diversity: Individuals with Disabilities

Diversity consideration in human resource management (HRM) moves beyond race, gender, and ethnicity and extends to individuals with disabilities. The Americans with Disability Act (ADA), signed into law by President George H. W. Bush in July 1990, prohibits discrimination against people with disabilities in employment, transportation, public accommodation, communications, and governmental activities. The ADA defines an "individual with a disability" as a person who has a physical or mental impairment that substantially limits one or more major life activities, has a record of such an impairment, or is regarded as having such an impairment. Previously, disabled persons were protected in employment under the Rehabilitation Act of 1973 (Nigro and Nigro 2000). EO 13163 signed by President Clinton in 2000 called for an increase of 100,000 individuals with disabilities to be employed in the federal government over 5 years. OPM implemented EO 13173 signed by President Obama in July of 2010 to increase federal employment of individuals with disabilities. The executive orders require different hiring targets and agency requirements for the federal government.

Currently individuals with disabilities represent a little over 5% of the federal workforce, and those with targeted disabilities represent less than 1% (Office of the Press Secretary 2010). When celebrating the 25th anniversary, the Federal Emergency Management Agency (FEMA) administrator made an outstanding diversity case. The administrator stated that until he has a workforce that reflects all the people in the USA that are affected by disasters, he will never have good plans for combating those disasters. When thinking about natural disasters such as flooding, hurricanes, and especially Hurricane Katrina, unless you have people that understand the place and the people affected by the disaster, you truly won't be prepared. Every agency provides services to the American public, and at OPM they have to make sure the workforce can do all of that.

## Importance of Employment

Individuals of all backgrounds enjoy the social benefits of being employed. The American Community Survey reported that about 41.3 million or 15.1% of the civilian non-institutionalized population, 5 years of age and older in the USA, are people who reported a disability (Brault 2008). Only around 20% of adults (individuals over the age of 18) with disabilities are active in the labor force, compared to around 70% of those without disabilities. The disparity is alarming and efforts are being made to close that gap. Lessons in this area include the importance of attention and follow-through of new government initiatives. Executive orders are important, but without the right people in place, the orders will not be turned into action.

Employment is critical to success in an individual's life. Being able to live a self-supporting life provides people with disabilities a feeling of enhanced self-worth and results in tax savings for society at large (Ledvinka 2010). Different individuals may need different accommodations and many public human resource agencies to ensure individuals get what they need. Safeguarding veteran employment rights and disability laws is essential to workplace equality and diversity. The health and safety of veterans and the disabled are beneficial to both work environments and for employee's personal health and their families. Flexible work-life balance helps veterans and

disabled people to sustain their livelihood and financial security – that may require time away from work to address maintaining their health care and health insurance needs.

Being aware of policies that apply to workers is most important in all matters of diversity implementation. These policies could be related to transportation, benefits, education, or training. Increased employment of diverse populations benefits all members of society. Making societal shifts in the perceptions of groups can take place, and employment is an avenue where change can happen. Broadening what diversity encapsulates will be an ongoing ever-changing issue. Both public and private managers will continue to have the need to construct a workforce that mirrors the population in which they serve. As our population changes, our definition of diversity may change. Which groups and individuals will be protected and have policy constructed for them will be a never-ending job. Race, gender, age, class, sexual orientation, disability, and the list of groups and subgroups could be endless. Policies can be constructed in broad terms but be implemented with a focused agenda. It will be necessary to provide the right service, to the right people at the right time. Many people will need many different things in terms of employment and services from government.

## Conclusion

Other areas of diversity research suggest that a critical mass of individuals with certain underrepresented attributes is necessary to produce real change. The critical mass concept, adopted from physics, is often applied to employment. A critical mass (one-third) of women in leadership roles is considered necessary to change views and attitudes toward women as well as build stronger organizations (Zoppo 2010). Ely (1995) found that until critical mass is reached for women in leadership position, neither men or women will change the perception of sex role stereotypes.

Inroads in closing that gap would be changed in this area. Policy and executive orders have been in place to facilitate some change here, but implementation and action have been lacking. Leadership and action need to be in place to see success in this area. Making the federal government a model employer will help make it a more attractive place of employment for the next generation coming into the workforce. Working for government and making a difference are where individuals can make a lasting impact in the communities to which they belong.

# Diversity Management and Cultural Competence in the Healthcare Field

Courtney Haun
Department of Political Science, Auburn University, Auburn, AL, USA

## Synonyms

Cross-cultural competence; Cultural diversity; Multicultural management

## Definition

Diversity management includes strategies towards the implementation of diversity and inclusion in the workplace. Within this management type, cultural competence is a set of behaviors, policies, and attitudes that join together to create an organization that fosters effective, cross-cultural outcomes.

## Introduction

Diversity management includes functions such as recruiting, building retention strategies, and developing performance evaluation protocols. All of these functions and more play a foundational role in healthcare organizations. The different management components of diversity encompass an organization's positive (or negative) cultural competence. By looking inward at these fundamental agents of action, an organization has the ability to develop and improve their cultural competence. Thus, through diversity management, one can create a workplace atmosphere where the touch points of an organization's influences all lead into the overall ability for the organization to be culturally competent.

The following paragraphs illuminate how the healthcare sector harbors cultural competence through an understanding of the importance of social and cultural influences on patients' health beliefs and behaviors. Also, within this specific field, multiple levels of the healthcare delivery system and interventions within them must be taken into account to assure cultural competence within the organization's employees and to the consumers being served.

## The Healthcare Domain

Within the domain of healthcare diversity management, there are a plethora of studies evaluating interventions to improve the cultural competence of health professionals. However, in healthcare, the motive of cultural competence is to impact patient satisfaction outcomes, not necessarily employee's satisfaction. Although an employee's cultural competence improves knowledge, attitudes, and skills of health professionals, in most studies, these positive effects are linked back to the patient instead of the employee (Beach et al. 2005). One could assume that these improvements ultimately affect employee satisfaction, nonetheless.

In healthcare, cultural competence comes forth in discussion because of major organizational issues such as patient care quality, racial and ethnic disparity, and high healthcare costs. Moreover, there has been a steady increase in cultural diversity in the USA, and because of this, it makes service delivery to those individuals that much more important. Cultural difference between patients and providers, which result in poor communication, is considered another significant

contributor to poor outcomes (Alizadeh and Chavan 2016).

In order to solve the issues, cultural competence frameworks have been extensively applied in the healthcare setting to evaluate the best approaches to obtain higher level outcomes. In most cases, outcomes are related to patient quality of life, satisfaction, and general health measures. Once again, the field of healthcare focuses on service delivery to the patient and evaluating of patient outcomes from cultural competence training. Healthcare is filled with best practice for service delivery to obtain good patient satisfaction outcomes through cultural awareness, knowledge, skills, encounters, and desires. There is also a focus on performance evaluation of the delivery of services through skills and knowledge measuring tools. However, there is a lack of focus on cultural competence surrounding recruitment and retention strategies for the healthcare workforce, and these are important strategies that need to be encompassed in diversity management efforts.

One study inspected what research has focused on improving cultural competence in healthcare (2005). Out of 34 studies, they found that the outcomes were focused on provider attitude (25), provided knowledge (19), provider skills/behavior (14), and patient satisfaction (3). The cultural competency trainings focused on different types of healthcare professionals including physicians, nurses, mixed groups, and "other" provider types. Performance evaluation was used to look at patient outcomes from the cultural competence trainings. According to the author, "cultural competence training shows promise as a strategy for improving health care professionals' knowledge, attitudes, and skills and patients' ratings of care. We believe that interventions that focus on the avoidance of bias, general concepts of culture, and patient-centeredness are promising strategies that should be prioritized for further study" (Beach et al. 2005).

## Diversity Management in Healthcare

Participating in diversity management is important for healthcare organizational success. An organizational work environment and overall job satisfaction are closely knitted to diversity management. This includes workplace diversity and diversity climate perceptions by employees. When diversity recruitment and retention efforts are not successful, turnover can be a result and become extremely costs for organizations. Loss of productivity, the cost of recruiting a new employee, and negative cultural impacts are just a few of the daunting negative effects from poor retention. Therefore, retention is a component of diversity management that must be deemed as highly important.

Also included in diversity management is performance appraisal. In essence, performance appraisal is built upon two fundamental objectives. The first is to create measures that have the ability to assess employee job performance. Secondly, evaluation systems are created to assess and advance operational processes within organizations (Pay for Performance 1991). Designing and operating performance appraisal systems are met with the unique characteristics of an organization. Hence, cultural aspects of employees should be a prominent feature in this system. In order to effectively appraise individuals within an organization and the organization itself, performance appraisal should include cultural competence. Cultural competency training is another major facet of diversity management with ongoing efforts to improve the quality of diversity awareness within the organization alongside performance appraisals (Dayal 1976).

## Outcomes from the Inclusion of Cultural Competence

By including cultural competence in the healthcare sector, the organization can make legitimate and long-lasting efforts to improve its internal and external goals and objectives. This involves the continuous evaluation of the organization's ability to deliver culturally competent healthcare through understanding of diverse ethnic and cultural groups, their traditions, beliefs, and value system during the provision of services. Healthcare organizations will also proactively

identify, inventory, measure, and evaluate the cumulative knowledge, skills, and abilities of their employees to interact successfully with one another and with diverse populations across health metrics. Diversity managers will engage their employees through trainings, workshops, and other tools to enhance the inclusivity within the organization. As an outcome, the organization will be able to convert the knowledge gained particular groups, employees, and individuals into policies and procedures that result in practices. Ultimately, this will increase the quality of the healthcare services provided yielding better outcomes.

At its core, employee recruitment is attracting the best available talent for the organization. As diversity increases, it is important for the healthcare field to recruit from a diverse and inclusive applicant pool. As a resource, employees are one of the most valuable assets and are necessary to deliver goods and services effectively. They can also be one of the most expensive liabilities a company has if they do not match the market and internal needs. Because of these components, recruitment efforts with diversity management can bring about a workforce that matches the population it is serving.

Knowledge and understanding of cultural makeup is another facet of the inclusion of cultural competence to create a workplace environment that fosters and reflects diversity of employees and the removal of all barriers that are harmful to culture. When a healthcare organization encompasses cultural competence, diversity managers will have the capability to measure impacts of organizational cultural functions through documenting, tracking, and evaluating. Managers can also use self-assessment protocols to evaluate services, structure, and practice. Employee and stakeholder engagement in feedback is of high importance and shapes future advancements for healthcare organizations as well.

## Why Cultural Competence Is Important

An organization can gain a competitive advantage by being able to attract, retain, and motivate people from diverse cultural backgrounds. This can occur through maintaining the highest level of quality human resources. Further capitalizing on the potential benefits of cultural diversity in work groups, organizations may gain a competitive advantage in creativity, problem-solving, and flexible adaptation to change (Cox and Blake 1991). In healthcare organizations, cultural competence is something that does not occur by accident. It requires effective leadership, the ability to monitor competency through reevaluations, and by providing resources necessary to foster cultural competence. At the organizational level, it is an ongoing process that must be maintained through periodic reassessments in order to produce more efficient organizations.

Diversity management efforts through recruiting, retention and development, performance evaluation, service delivery, and more, are all important in the healthcare space for a variety of reasons. By being more culturally competent, the healthcare workforce can help to improve patient care quality, reduce racial and ethnic disparity, and reduce healthcare costs. Cultural competency should be seen as an essential component for this sector of organizations.

## Conclusion

Cultural competence is critical, because it is used in the cultural context in which public encounters occur. It also presents an opportunity to address the often inaccurate public service and programs provided and highlights on best workplace practices. Therefore, through diversity management, cultural competence can increase the relevance of an organization's administration, services provided, and workplace in general. Employees in the workplace will be better equipped to deliver services by being more prepared to do their jobs (Rice 2007).

Although, health administration scholars have devoted less attention to cultural competency as it relates to employees, others have highlighted the importance of various management efforts. Whitman and Valpuesta (2010) note that workforce and staff development efforts including employee

recruitment, retention, and promotion also need to embrace cultural competence in healthcare. Within these multifaceted human resource strategies, some direct practices for cultural competence include internships, marketing early to employee prospects, providing mentoring programs, and training opportunities such as support networks and educational advancement (Whitman and Valpuesta 2010).

Cultural competence, at its core, is the ability to work effectively with culturally diverse people whether they are co-workers, patients, or employees. However, diversity management components towards the concept of cultural competence are complex and multifaceted. Therefore, when thinking about the healthcare landscape of diversity management, many personnel management functions can be applied such as recruitment, retention, evaluation, and training. As an overarching theme, the challenge of cultural competence is being faced by the healthcare sector due to growing cultural diversity during intercultural interactions with patients and employees. Exploring diversity management and reaching cultural competence is essential for organizational success in healthcare and other fields as well.

# Diversity Management in Egyptian Public Contexts: When the Heat Yields Cold Reactions

Mohamed Mousa
WSB University, Dabrowa Gornicza, Poland

## Synonyms

Culture; Diversity

## Crisp Definitions of the Key Title Words

- Culture means "the collective programming of the mind that distinguishes the members of one group or category of people from another" (Hofstede and Hofstede 2005, p. 28).
- Diversity refers to the state of being different (Mousa 2019). Moreover, Heuberger, Gerber, and Anderson (2010, p. 107) defined it as "many types of differences, such as racial, ethnic, religious, gender, sexual orientation, and physical ability, among others."

## Diversity Management: History and Trends

The concept of diversity is not new to either academic or professional managerial agenda. The majority of Western countries have a long history of debating, designing, articulating, implementing and also assessing cultural differences and diversity-related policies (Morrison et al. 2006). Moreover, both academics and practitioners in those Western countries have asserted

that the main goal of diversity management and its related policies revolves around ensuring the fair representation of minority-affiliated members in different workplaces and organizational levels (Ashikali and Groeneveld 2015). However, such fair representation of minorities has been developed and sustained after decades of debate about social and workplace discrimination, cultural bias, negative and positive prejudice, social equality, and workplace justice. Morrison et al. (2006) elaborate that early attempts to address diversity management focused on managing differences only in terms of gender and race in different workplace settings.

However, and due to growing clashes, which sometimes escalate even to public unrest on the streets, over differences in age, religion, nationality, sexual orientation, political ideology, and others, the concept of diversity has expanded to include all these differences and conflicts (Mousa 2018). Noticeably, and based on the aforementioned, diversity and diversity management have attracted considerable attention among researchers and practitioners in Western universities. What then is the situation in developing nations? Has diversity management been prioritized in academic institutions and schools of humanities and business? Has diversity been considered a hot topic with the public and media in developing nations?

The answer to this question differs from one developing nation to the next. A country like the United Arab of Emirates established a ministry for cultural diversity in 2018 and even a ministry for happiness in the same year. A country like Saudi Arabia still walks one or two steps behind particularly in terms of gender, religion, ethnicity, and political ideology-related diversity despite amendments this country has initiated in the past 15 months towards the empowerment of women. India claims that it exerts efforts to guarantee the sociocultural rights of its Muslim minority. However, Muslims there confirm that they are forced to live in specific counties, and they feel unwelcome to serve in the Indian public administrative system. By comparison, South Africa has developed and sustained its successful model of inclusion and respecting differences in which white and black people live together in peace. Tunisia has recently established its diversity model through securing women the same social, cultural, and political privileges as men. This may be described as the first and only post-Arab Spring woman-friendly society.

One may ask what should diversity management deliver? What should be achieved from adopting diversity management protocols? What should be the result of a diversity strategy? Apparently, ensuring fair representation for minority-affiliated members is no longer sufficient in today's diversity management. The impetus for the effective management of diversity should revolve around creating and developing an inclusive organizational climate or what management scholars call "organizational inclusion." Such an inclusive climate entails that the uniqueness of minority individuals is acknowledged and valued. Accordingly, ambition, assessment, and organizational membership will not be limited on the basis of religion, age, race, skin color, and so on. Moreover, every employee should be treated as an insider, which can then stimulate his attainment of individual outcomes (job satisfaction, fair assessment, etc.) and organizational outcomes (loyalty, performance, commitment, presenteeism, etc.). Does such organizational inclusion exist in the public organizations of developing nations? Do the employees in these public organizations feel treated as insiders? Do they face any form of workplace discrimination, cultural bias, negative prejudice, or stereotyping because of their affiliation with a particular gender, religious, political, ideological, or sexual orientation? The Egyptian experience may provide an answer to such questions.

## The Egyptian Experience in Diversity Management

According to Hofstede and Hofstede (2005), the Egyptian culture is characterized by the following:

- Power distance, according to which leaders have and exercise unquestionable authority.

- Uncertainty avoidance, according to which Egyptians tend to reject any change and constantly have fears about the unknown.
- Individualism – family in Egyptian culture strongly shapes individual behavior.
- Masculinity – men have a dominant role, and they are the main breadwinners in Egyptian society, while women are in charge of raising children.

In his study, Mousa (2017) asserts that Egyptian society is passing through a divisive stage. In his study, this author confirms that this was implicitly experienced prior to the 2011 Arab Spring and Egyptian revolution. Moreover, this assertion has been upheld and confirmed post-Arab Spring. This justifies why cultural clashes among Egyptians in terms of political ideology, religion, and social class have become more common if not daily practices.

Mousa (2017) addressed female nurses in Egyptian public hospitals through semi-structured interviews and found an explicit workplace conflict based on religious differences. Christian nurses prefer to deal only with Christian colleagues, and Muslims deal also with Muslim ones. It is disappointing that the concepts of majority and minority are widely used in this context. Furthermore, evidence suggests that Christian nurses work hard just to maintain a good image of their religion "Christianity," while Muslim nurses are not required to exert the same level of performance because they are the majority. Such in-out group differentiation is known to everyone there, but the administration of public hospitals prefers not to intervene because the Muslim-Christian relationship is a sensitive political issue and they feel that only the government has the authority and strategic orientation to cool this conflict.

Another disturbing fact is the superiority that male managers exercise over female nurses. Such workplace exclusion is the only element that unifies both Muslim and Christian nurses. All females there regardless of their religion have stated that they feel they are treated as if second-class by their male managers. They are obviously excluded, marginalized, or even discriminated against because of their gender. Such preferential advantage for Egyptian men is easy to identify. Unfortunately, and despite such violations of the principles of justice, the administration of the public hospitals there maintains this status quo. Moreover, managers there do not consider that excluding women in any way reduces their credentials, merit, and work experience, but is instead an adoption of the social norms they wish to transfer from one generation to another. This obstructs any attempt to improve the current situation for women in the workforce in Egypt.

In this regard, a study by Mousa, Massoud, and Ayoubi (2020) asked whether "female physicians perceive diversity management practices more positively than their male colleagues?" or in other words, "do female physicians act responsively with diversity protocols/policies initiated by their organization/workplace?" After focusing on physicians in Egyptian public hospitals, this study discovered that the female physicians positively perceive the diversity management practices of their organization. Moreover, those female physicians seek an inclusive climate in which they feel respected, recognized, fairly treated, and fairly assessed without being limited on the basis of gender. However, it is worth highlighting that the government has set a quota of 25% of parliament members to women after an amendment to the Egyptian constitution in 2018. This step has been perceived as a victory for Egyptian social activists, human rights actors, and young politicians.

Consequently, the question that should be raised here is: "Is there a kind of diversity challenge (e.g., workplace discrimination) in the workplace setting of the organisations in the sample?" Mousa (2018) answered this question through elaborating that organizational cynicism, which is the negative attitudes employees form and maintain towards colleagues, occupations, and the organization, is the main outcome of any failure and/or absence of the sound management of cultural differences. By addressing physicians in Egyptian public hospitals, Mousa (2018) identified a significant positive correlation between diversity challenges (workplace discrimination) and the following three types of organizational

cynicism: first, *cognitive cynicism*, which reflects an employee's belief that his organization lacks integrity, justice, and transparency; second, *affective cynicism*, which reflects employee anger and disgust towards his organization; and lastly, *behavioral cynicism*, which reflects an employee's powerful negative criticism of his organization. According to the same study, organizational cynicism explains much of the negative behavior among employees, such as the high rate of absenteeism, psychological withdrawal, and also physical withdrawal from the organization. Moreover, a high level of employee organizational cynicism entails the indication that his organization lacks a commitment to equality and honesty.

Based on the aforementioned, it has become vital to question why diversity is not listed as a priority in Egyptian public organizations. Why do public organizations in Egypt not effectively manage the diversity of their employees? In other words, what factors inhibit the management of cultural diversity? Alas and Mousa (2016) highlighted that addressing or dealing with diversity-related challenges requires the inclusion of diversity as a major part of the culture of organizations. Unfortunately, this is not the case in Egyptian organizations. The same authors observed, when addressing one business school in Egypt, that both post- and undergraduate students are not provided with any training about how to tackle multiculturalism. Moreover, no courses about organizational inclusion exist. Therefore, business schools in Egypt neglect all the sociocultural, political, and economic changes taking placing in Egyptian society. Furthermore, they focus only on equipping their students with business knowledge and skills. This state of division, which requires culturally responsive curricula to connect in-school learning with out-of-school living, is completely neglected in the context of Egyptian business schools (Alas and Mousa 2016; Mousa 2019). This explains why topics such as the empowerment of women, the rights of ethnic minorities, and even intercultural communication have not been given sufficient space in Egyptian academic research. Apparently, the low level of sociocultural, political, academic, and economic freedom Egyptians currently experience has had a profound impact on shaping their academic and daily practices (Mousa 2019). Therefore, diversity in Egyptian public organizations will not be systematically and effectively managed without the government taking the initiative. Otherwise, it will remain a sensitive topic that Egyptians suffer from but cannot debate or find a solution to.

## Conclusion

This chapter starts by discussing the emergence and development of the concept of diversity. Moving forward by focusing on Egyptian public organizations, the author responds to the following questions: What is needed from diversity management practices? Is there an effective approach to the management of diversity in Egyptian public organizations? How can public organizations in Egypt deal with diversity challenges? And why is diversity not perceived as a priority in the Egyptian context?

# Diversity Management in the Public Sector

Inayah Ali, Subhash Appana and Jashwini Narayan
The University of the South Pacific, Suva, Fiji

## Synonyms

Diversity management – managing diversity; Employee work outcomes – employee performance; Productivity – efficiency; Service delivery – public service

## Definition

Diversity management refers to the manner in which differences are managed among the workforce.

Public Sector Reforms involve changes that have been made to the public sector since the 1980s in order to improve performance.

Heterogeneous workforce is considered here as a workforce that has people with different backgrounds and attributes.

## Introduction

Diversity management (DM) has become one of the critical concerns of public sector reforms in recent times because of demographic and population shifts in society. The notion is that public organizations can achieve their organizational objectives like service delivery more effectively through DM (Ohemeng and McGrandle 2015). According to Klarsfeld, Booysen, Ng, Roper, and Tatli (2014), different countries demonstrate three key characteristics of DM at work: contextuality, relationality, and dynamism. The meaning of diversity and categories of difference that are included in managing diversity frameworks are informed by country-specific historical legacies, labor market conditions, and regulatory environments. International agencies such as International Labor Organization (ILO), United Nations (UN), and regional bodies such as European Union (EU) can also exert influence on DM at work (Klarsfeld et al. 2014). There are competing views on the most effective ways of managing diversity, tackling discrimination, and promoting inclusion and fairness at work. DM is a relational and negotiated process that involves multiple actors with different interests and viewpoints such as state, employers, trade unions, and new actors including nongovernmental organizations (NGOs), professional bodies, community groups, and diversity consultancies. Futhermore, DM is not static but dynamic, changing in line with the political and economic pressures nationally and internationally. Thus the dynamism and implementation of DM differs across countries and their public institutions. This entry provides a historical review of DM in the public sector in key countries around the world.

## United States of America

In the USA, where the term *diversity management* originated, there was a gradual progression over the years from Title VII of the 1964 Civil Rights Act that mandated equal employment opportunity (EEO), to President Lyndon Johnson's 1972 Executive Order 11246 that outlined affirmative action (AA), culminating in DM policies and programs developed in the 1990s and 2000s. In addition, there are other laws such as the Equal Pay Act of 1963, the Age Discrimination in Employment Act of 1967, the Americans with Disabilities Act of 2008, and Genetic Information Nondiscrimination Act of 2008; all these play a crucial role in understanding employer requirements. The focus of managing diversity in the USA is often attributed to two reports published by Hudson Institute in the late 1890s; *Workforce 2000* and *Civil Service 2000* commissioned by the Office of Personnel Management (OPM) (Naff and Kellough 2003). While both reports highlighted the increasing penetration of the national labor force by women and people of color, the second report by OPM specifically addressed challenges the federal government would face as an employer

over the coming decades (Naff and Kellough 2003). The early "business case" for diversity was made by Thomas (1990) stating that the goal of diversity is to get "the same productivity" from a heterogeneous workforce.

Today the federal workforce in USA is guided by the Government-Wide Diversity and Inclusion Strategic Plan 2011. This plan outlines the implementaion of the President's Executive Order 13583 on Establishing a Coordinated Government-Wide Initiative to Promote Diversity and Inclusion in the Federal Workforce. It directs executive departments and agencies to develop and implement a more comprehensive, integrated, and strategic focus on diversity and inclusion as key components of their human resource strategies. A number of federal agenices and departments such as US Department of Commerce, US Department of Labor, and US Department of Education and the Office of Inspector General have linked their strategic plan on diversity and inclusion to this plan. The goals of this strategic plan are (1) workforce diversity – recruiting diverse, qualified group of potential applicants to secure a high performing workforce drawn from all segements of American society, (2) workplace inclusion – culture that encourages collabration, flexibility, and fariness to enable inviduals to reach their full potential and retention, and (3) sustainability – developing structures and strategies to equip leaders with the ability to manage diversity, be accountable, measure results, refine approaches, and institutionalize a culture of inclusion.

## Canada

The state of Ontario, the second-largest public sector employer in Canada, made the first attempt to enhance workplace diversity through the publication in 1984 of *Equality in Employment: A Royal Commission Report*. This led to substantial changes in public policy aimed at changes in nationwide employment culture and discrimination of minorities in Canada (Ohemeng and McGrandle 2015). These researchers explored the importance of DM in public sector organizations specifically aimed at understanding the challenges faced by public managers in the implementation of diversity initiatives and inclusiveness in the Ontario public service (OPS). In 2008, the government of Ontario launched a Framework for Action (FA). It was the first comprehensive diversity strategy that communicates aspects on diversity, equity, accessibility, and inclusion as fundamentally important to a modern, progressive civil service. The FA called for development of OPS diversity strategy with specific goals of: (1) identifying and removing discriminatory barriers to fair and equitable employment processes and opportunities; (2) increasing the representation of diverse groups at all levels; and (3) changing individual behavior and mindsets. These diversity goals were achieved through various objectives such as OPS leaders to lead by example in their commitment to diversity, ensuring that all the public employees are aware of the existing mechanisms to respond to discriminatory behavior, equal opportunity with support to all employees to progress in their career, and using fair and open merit and recruitment system to reflect at the diverse province (Ohemeng and McGrandle 2015). Through this policy the government's framework for modernization of the civil service was rolled out. This framework is aligned to the OPS Human Resource plan, which is a workforce business plan for the entire public sector so that DM initiatives are fully strengthened and realized.

Prior to FA, there were a series of Acts passed by the government to manage diversity in OPS such as Accessibility for Ontarians with Disabilities Act 2005 and the Employment Standards Acts (Ohemeng and McGrandle 2015). In 2008, the government set up an OPS Diversity Office (OPSDO) and appointed the first ever Chief Diversity Officer. The Diversity Officer is given equal membership to the Deputy Ministers Council as well as membership to the Executive Development Committee and participates in most of the important decisions for the OPS. In addition to these DM strategies, there is the Inclusion Lens initiative, which is a user-friendly online tool that helps OPS public employees to become more knowledgeable about diversity and inclusion (Ohemeng and McGrandle 2015).

In the Canadian public sector at the federal level, the Royal Bank of Canada (RBC) is one of the most prominent organizations in managing diversity. The organization not only attempts to employ more minority group members, but also creates an environment of inclusion where every employee has equal opportunity to reach his or her potential (Rotundo 2012). The RBC's strong commitment to diversity earned them a prestigious award in 2010 – the Catalyst Diversity Award for advancing minorities and women as well as Canada's Best Diversity Employer for its inclusive and diversity programs (Rotundo 2012).

## United Kingdom

The UK labor market constitutes vibrant diversity generated through an influx of migrants, demographic shifts toward feminization of the workforce, and an aging population. The UK has a well-established equality legislation such as the *Equality Act 2010* covering provisions based on the grounds of gender, age, disability, pregnancy and maternity, race and ethnicity, religion or belief, and sexual orientation (Klarsfeld et al. 2014). Textbooks related to diversity and workplace equality suggest that the diversity paradigm has broadened the agenda for trade unions and other organizational actors, particularly in raising awareness and campaigning for mental health, sexuality, and disability at the workplace (Milner 2017). The public sector is bound by the secondary legislation of Equality Scheme (2011) to produce equality schemes and to monitor specific aspects of diversity (Klarsfeld et al. 2014). The emphasis on individualism and volunteerism in the DM approach has attracted criticism in the UK. Despite the emphasis on voluntarism in the DM paradigm, organizational equality and diversity efforts are mainly driven by legal compliance in both the public and private sectors (Klarsfeld et al. 2014). In previous research in the UK, it was pointed out that public organizations implemented equality policies before the private sector.

The business case for diversity supporting workplace diversity developed more slowly in Europe compared to the USA, which started during the late 1980s. However, translating the profit concept of the business case for diversity is over-stretched, and generalizing it from the US business context to the National Health System (NHS), a public funded healthcare system in the UK, is problematic (Powell and Johns 2015). The diversity agenda was started by the government since the enactment of Disabled Persons (Employment) Act in 1944. The Race Relations Act 2000 was supported by positive actions for key government departments where NHS was a good example of legislation-based DM in the UK public sector (Powell and Johns 2015). The NHS complies with the Equality Act 2010 and Public Sector Equality duty to reduce inequalities in employment especially for gender and black and minority ethnic (BME) groups. However, there is less representation and diversity of BME at the senior levels in NHS (Powell and Johns 2015). The NHS consists of 600 NHS trust, health boards, and organizations which make it difficult to maintain consistency in managing diversity.

## Australia

In Australia, diversity has transformed and evolved over many years. Since Federation, the government has shifted its policy from White Australia to an assimilation policy in 1950s and 1960s and an integration policy in later years of 1970s (Chidiac 2018, p. 107). After the 1960s, there were many legislations through industrial relations systems, which brought dynamic changes to Australia's social policy and employment environment. Today, Australia has an extensive array of laws, which forbids employment discrimination on the basis of gender, race, age, ethnicity, and many other characteristics (Klarsfeld et al. 2014). The country has many proactive policies which focus on employment equality for women (in all sectors) and aboriginal people (in the public sector). It is noted that developments in diversity legislations were a result of domestic influences, changing labor market trends, nascent civil rights and women's movements, and international influences such as UN and ILO conventions (Stone 2017, p. 784).

There are a series of major Australian legislative frameworks related to workplace discrimination and promotion of EEO such as *Racial Discrimination Act 1975, Sex Discrimination Act 1984, AA Act 1968, Human Rights and Equal Opportunity Commission Act 1986, Equal Employment Opportunity (Commonwealth Authorities) Act 1987, Human Rights and Equal Opportunity Act 1991, Disability Discrimination Act 1992, Age Discrimination Act 2004, and Workplace Gender Equality Act (WGEA) 2012* (Chidiac 2018, p. 109; Stone 2017, p. 784). The WGEA 2010 recommends that organizations move beyond the concept of "diversity as only a social justice issue to diversity as a competitive business strategy" supporting the premise that managing diversity should reflect equity in the workplace. It should be noted that workplace equity does not mean equality meaning treating all employees the same way. Rather equity recognizes the different needs of people and treats them in a fair and flexible manner (Stone 2017, p. 787).

The Australian Public Service (APS) Diversity Council was established in early 2012, by the Secretaries Board, to reinforce and reinvigorate Australia's commitment to diversity. The Diversity Council has particular focus on improving employment outcomes for Indigenous Australians and people with disability in the APS, in response to unfavorable outcomes for these groups. In addition to passing many Acts dealing with different aspects of DM, the federal government introduced *Public Service Act 1999* to establish the APS employment principles and recognized diversity in the community to foster diversity in the Australian workplace. The Act requires that each federal agency has workplace diversity program to ensure APS employment practices are effectively implemented. The purpose of this Act is to design and sustain human resource policies such as planning, recruitment, selection, performance appraisal, and workplace relations, which reflect at APS's commitment in taking a step further in planning and implementing DM policies and practices in Australian organizations.

## New Zealand

The demographic trends show an increase in workforce diversity in New Zealand. Accelerated migration from the Middle East, India, East Asia, and Africa and significant differences between ethnic groups has changed the workforce composition. It is projected that by 2026, Maori population will increase by an average of 1.3% a year, the Pacific Islands population by 2.4% a year, and Asian population by 3.4% a year (Houkamu and Boxall 2010). The wave of managing diversity started through the enactment of anti-discrimination legislation also known as Human Rights Act, 1993. The act has delegitimized discriminatory organizational policies and practices in New Zealand (Deborah et al. 2000). However, since the early 1990s, only public organizations were required to have EEO policy. In 1991, the EEO Trust was established by the government to educate the private sector about EEO (Deborah et al. 2000) mainly through an espoused business case for diversity (Houkamu and Boxall 2010).

## India

The DM paradigm in India's public sector organizations is significantly different from the UK, Canada, USA, Australia, and New Zealand. Haq's (2012), research compared the attitude of managing diversity between public sector organizations and multinational corporations (MNCs) in India. It found that public sector organizations are regulated by the Indian AA policy of "reservation" and quotas for scheduled castes such as Dalits (a low caste category), scheduled tribes, and other minority classes. For instance, in the recruitment process the public sector has strict guidelines for these groups only with certain percentage of positions per job category allocated in higher education, civil service, and legislative bodies while secondary quota is for persons with disability and women when applicable. The concept of managing diversity in India's public sector mainly complies with AA policy of "reservation" through quotas whereas in MNCs, it is primarily

directed toward accommodating women in the workforce (Haq 2012).

## Other Countries

Likewise, in Kenya the "National Cohesion and Integration Policy" as stated in the new constitution requires one third of elected bodies to be made up of marginalized people such as women, persons with disabilities, ethnic, and other marginalized groups in Parliament. The Public Service Commissions, in collaboration with human resource managers, are promoting this as one third rule for women and minorities when recruiting civil servants at higher positions (Wambui et al. 2013).

Similarly, Brazil relies on AA using a compulsory quota system to eliminate persistent inequalities throughout history. The quota system affirms equality in opportunities, treatment, compensation, or losses caused by discrimination due to racial, ethnic, religion, and gender discrimination (Jabbour et al. 2011). Large businesses have been facing pressure from the Brazilian Government to incorporate a specific quota system for minority groups as a DM practice.

## Conclusion

This entry provides a historical review of DM in the public sector in the USA, Canada, UK, Australia, New Zealand, and India with brief reviews of Kenya and Brazil. The similarities in antidiscrimination policies and differences in the approach to managing diversity as more than a legal compliance are evident across these countries. The business case for diversity was seen in the USA and Canada while it is slowly developing in Australia. Diversity efforts in the UK and New Zealand are driven by legal compliance to EEO. In other countries such as India, Kenya, and Brazil, DM is viewed as a legal compliance to AA policies rather than as a business case. The DM paradigm in each country has been shaped by one or a combination of contextuality, relationality, and dynamism (Klarsfeld et al. 2014). For instance, in the USA, historical legacies of Civil Rights Movements, political influence, and diversity consultants plus other actors have shaped DM at the workplace. In Australia, changing labor market conditions, industrial relations systems, and international agencies have also influenced the DM paradigm. DM, thus differs across countries and is shaped by factors within national contexts amid international pressures.

# Diversity of Capitalism in the New EU Member States

Eric Magnin
LADYSS, Department of Economics,
University of Paris, Paris, France

## Synonyms

Comparative analysis of capitalism; Economic systems; Varieties of capitalism

## Introduction

In the early 1990s, Central and Eastern European Countries (CEECs) embarked on a major transformation of their economic and political systems. The aim was to move away from the Soviet-inspired socialist system toward the West European type of economic system, generally described as a market economy. This was an unprecedented, large-scale phenomenon of economic, social, and political change. The "transition to a market economy" gradually gave way to another process of institutional change, the process of integration into the European Union (EU), which involved reforms aimed at ensuring the conformity of CEEC institutions with EU legislation.

This twofold transformation process has led specialists to question the type of economic model likely to emerge from these successive reforms (Chavance and Magnin 2002). Market economy is indeed a vague and theoretical concept, which does not correspond to the reality of economies in developed countries. There are actually a variety of models of capitalism at the international level, with different economic and social performances. But this diversity becomes only evident at the institutional level. Indeed, at a relatively high level of abstraction, contemporary developed economies appear relatively similar. What they have in common is the existence of a labor market, a market for goods and services, a financial market, a two-tier banking system (central bank/commercial banks), a system of income distribution, and so on. However, on closer examination, national institutional forms are relatively diversified. For example, the French tax regime has nothing in common with its American counterpart. The social protection system is not the same in France as in Great Britain or Japan. These various institutional configurations exhibit a relative coherence that allows them to be grouped into "models" of capitalism.

The "transition to a market economy" has helped to stimulate work in the field of the comparative analysis of capitalism and brought to light several approaches. The CEECs constitute a privileged field of application for this research.

## The Comparative Analysis of Capitalism

Since 1990, many works have contributed to enrich the comparative analysis of capitalism. However, two major approaches, toward which all the others seem to converge, stand out in this profusion: the so-called "varieties of capitalism" (VoC) approach proposed by Hall and Soskice (2001) and the régulationist-inspired approach promoted by Amable (2003), in the path traced by Boyer (1990).

The *varieties of capitalism* approach is focused on the firm as the major actor in the capitalist economy, whose success is based on the development and exploitation of its core competencies or "dynamic capabilities" (Hall and Soskice 2001). It emphasizes the relational dimension of the firm. A firm's success depends largely on the quality of the relationships it has been able to establish with internal (employees) and external

actors (suppliers, customers, shareholders, unions, employers' organizations, the state, etc.). Coordination issues are therefore at the heart of the VoC approach.

Hall and Soskice identify five spheres of activities in which companies will have to solve coordination problems decisive for the exploitation and development of their core competencies: industrial relations, vocational training and education, corporate governance, interfirm relations, and relations with their own employees. There are two major ways of solving these coordination problems, which differentiate the two main types of capitalism in developed economies: coordination based on market mechanisms, typical of liberal market economies (LMEs), and nonmarket coordination or "strategic interaction," characteristic of coordinated market economies (CMEs).

The VoC approach can be considered as a neo-institutionalist approach, as attested by references to North, Williamson, and Aoki (Chavance 2008). Indeed, it gives an important role to formal and informal institutions, to the market-hierarchy dichotomy, with the idea that institutions, whose historical dimension is underlined, facilitate the coordination of interrelations between actors.

Germany is the typical example of a coordinated market economy. Nonmarket coordination prevails in the various spheres of activities. The United States is the textbook case of the liberal market economy, where coordination problems in the different spheres are solved mainly through market relations.

The VoC approach, which is based on a distinction between two types of capitalism, is reminiscent of the division made by M. Albert (1993) between Rhenish capitalism and Anglo-Saxon capitalism. It offers a clear theoretical framework for comparing different national economies, but with one dimension in particular, the firm and its coordination problems, and one separation criterion, the market's role. Consequently, this binary classification does not allow for the integration of all the developed economies, as Hall and Soskice (2001, p. 21) themselves acknowledge by referring to the "more ambiguous positions" of some Southern European countries (France, Italy, Spain, Portugal, Greece).

The other theoretical framework, which falls within the field of the comparative analysis of capitalisms, is the one proposed by Amable (2003) and before him by Boyer (1990), who criticizes the unidimensional vision of VoC and prefers an approach that highlights *the diversity of capitalism* by relying on a typology of five models. This approach is part of an institutionalist theoretical framework in economics, within the tradition of the French school of régulation (Boyer 1990). Régulation theory focuses on the diversity of institutional configurations in time and space, of the modes of régulation which give them their coherence, and of the accumulation regimes which they underlie.

Amable (2003) identifies a number of "key institutional domains" (very close to the canonical forms of the Régulation theory) in which OECD countries show significant differences. These include competition on product markets, wage-labor nexus and labor market institutions, financial intermediation and corporate governance, social welfare, and education systems. Amable's study is based on data analysis, i.e., a principal component analysis associated with an ascending hierarchical classification, applied to 21 OECD countries to reveal the existence of 5 types of capitalism. These are the market-based model or Anglo-Saxon capitalism (the United States, the United Kingdom, Canada, Australia), the social democratic model (Sweden, Finland, Denmark), the continental European model (France, Germany, Austria, Belgium, the Netherlands, Switzerland, Norway), Mediterranean capitalism (Italy, Spain, Portugal, Greece), and Asian capitalism (Japan, South Korea). However, each model of capitalism can be considered as an ideal type, to which no real economy perfectly corresponds. To briefly outline a few features of each model, the market-based model is relatively similar to LMEs, as the role of the market is predominant in the different institutional domains. Social democratic capitalism is characterized by a high level of social protection, supportive industrial relations, and an important role of the state. The continental European model is not that far, with greater employment protection and more conflictual labor relations. The Mediterranean model shows a dual labor

market, weaker social protection, and an education system focusing on the acquisition of general skills. As for Asian capitalism, it is marked by the weight of large conglomerate companies, supportive labor relations, weak social protection, and low level of public spending on education.

Since 1990, the comparative analysis of capitalisms has also been enriched by integrating the concepts of institutional complementarity and hierarchy.

Two institutions can be described as complementary when "the existence or the particular form taken by an institution in one area reinforces the presence, functioning or efficiency of another institution in another area" (Amable 2003, p. 60). The concept of *institutional complementarity* is shared by both the VoC and the diversity of capitalism approaches. The example of complementarity between financial and education systems illustrates the concept (Amable 2003). A financial system dominated by financial markets favors the pursuit of short-term profitability, which results, on the employment side, in a low commitment of the firm to its workers and a high risk of layoffs. Under these conditions, employees will prefer to acquire general rather than firm-specific skills to facilitate their redeployment to other firms. A financial system dominated by banks stimulates long-term investment, which in turn promotes stable compromises between social partners that encourage the acquisition of specific skills. In both cases, each institution reinforces the influence of the other. The abovementioned CMEs and LMEs also exhibit complementary relations between their founding institutions.

The concept of institutional complementarity has a number of implications that are worth emphasizing. First, a model of capitalism is not a collection of institutional forms, randomly brought together, but a particular combination of these forms linked by complementary relations. This results in a relative systemic coherence. Second, it becomes difficult, theoretically and empirically, to correlate an economic performance with a single institution because of this interdependence among institutions. It is a configuration of complementary institutional forms "making a system" that is responsible for the overall performances of the model.

Thirdly, it is therefore not advisable to design an optimal institutional configuration, which would combine institutions from different countries that are considered to be the most "successful" in each area: for example, the US labor market regulations and tax system, the Swedish education system, the Danish employment policy, etc. Importing into one type of capitalism an isolated institutional form from another model could lead to an unsustainable configuration. One can then question, for example, the coherence of the association between labor market flexibility and "generous" social welfare, the famous "flexicurity," as well as the very widespread use of institutional benchmarking practices. On the other hand, different configurations of complementary institutions might produce similar macroeconomic performances. This was the case with the Anglo-Saxon model and the social democratic model in the 1990s (Aiginger 2005). This is also the basic assumption of the VoC approach, at the root of the CME-LME dichotomy.

The concept of *institutional hierarchy*, for its part, is mainly present in the approach of the diversity of capitalism and is part of the more recent régulationist work (Amable 2003). It expresses the idea that an institutional form plays a dominant role in relation to the others at a given point in time, both in the organization of complementary relations and in the dynamic evolution of the institutional architecture. The authors recognize the formation of this hierarchy as an expression of power relations and political compromise. But it is the emergent, unintended result of an unplanned process of confrontation of vested interests at a given point in time. The primacy of the wage-labor nexus, favorable to workers, in the Fordist period (1945–1975) is the outcome of the sociopolitical compromises that emerged in the post-war period in response to the previous dramatic episode. Since the 1980s, this hierarchy has been called into question in favor of other institutional forms: competition conditions for some specialists and finance for others.

The notion of institutional hierarchy also calls for further remarks. Institutional hierarchy and complementarity appear to be distinct but related concepts. Indeed, one of the expressions of the hierarchy lies in the influence, through constraints and incentives, that the dominant institution exerts on the modalities of complementarity within a given institutional configuration. It leads the other institutions to strengthen it, even if it means making them evolve a little. For example, the priority given to workers during the Fordist period has led other institutional forms to be articulated in such a way as to strengthen it. Or else, the predominance of finance in the recent period has led to a change in the wage-labor nexus and social welfare, which have now been challenged by finance.

From a dynamic perspective, one can imagine a shift in the institutional hierarchy according to the evolution of political power relations, which does not necessarily mean a change in the model of capitalism.

## Application to the New EU Member States

While the post-socialist transformation has contributed to the development of work on the diversity of capitalism, the Central and Eastern European countries, which entered the European Union in the mid-2000s, constitute in turn a privileged field of application for the comparative analysis of capitalist models. Many authors have thus tried to apply the two previously presented analyses, the VoC and the régulationist approaches, to transition economies.

In the framework of *the VoC approach*, some specialists argue that Estonia and Slovenia can be considered as very good examples of, respectively, a liberal market economy and a coordinated market economy. Among the different spheres of activities at the center of the VoC approach, Feldmann (2006) focuses more particularly on industrial relations. He shows that the Slovenian model "represents a consensual and coordinated approach to industrial relations and social dialogue, with strong employers' organizations and unions, and also exceptionally high coverage of collective agreements" (Feldmann 2006, p. 841). By contrast, the Estonian industrial relations system exhibits all the characteristics of LMEs with decentralized wage negotiations, limited coverage of collective agreements and weakness of both unions and employers' organizations. Buchen (2007) confirms Feldman's results and extends his analysis of industrial relations to the other VoC activity spheres and to the dynamics of comparative institutional advantages. He shows that both countries exhibit a high degree of institutional complementarity. In Slovenia, the industrial relations system is consistent with a highly protected labor market, while the vocational training system provides specific skills. In Estonia, industrial relations and labor market features are complementary to a vocational training system reorganized toward general education. Trade figures and patterns of foreign direct investment complete the picture and reveal comparative institutional advantages of CME type in Slovenia and LME type in Estonia. As the VoC approach predicts, different clusters of complementary institutions may result in equally good macroeconomic performances. This has been the case for Slovenia and Estonia during the transition process.

For their part, Nölke and Vliegenthart (2009) propose another way of applying the VoC approach to Central Eastern European countries, inspired by King's work (2007). For the latter, these economies (Hungary, Poland, the Czech Republic) can be described as *dependent liberal capitalism*. Referring to the different spheres of activities of the VoC approach, he qualifies them in the following way: liberal industrial relations related to employees' demobilization in the post-socialist world (weak trade unions), an education system that no longer meets the companies' needs, and a corporate governance dominated by foreign banks. The key element of the model is the weight of foreign investors in banks and other companies' capital. Economic performances depend on the strategy of industrial and financial transnational corporations (TNCs), which provide capital, technology, skills, and access to global

markets. King contrasts this model to the post-communist *patrimonial capitalism* (Russia, Ukraine, Romania), marked by the collusion of political and economic elites and the central role of cronyism, which invades all VoC spheres (no corporate governance, neopaternalist industrial relations, etc.). Beyond his reference to the VoC, King considers that the former socialist countries represent two specific models, a little bit far from the LME and CME logic.

More in line with the VoC approach than King, Nölke and Vliegenthart (2009) consider that, at the end of their transition/accession process, CEECs are now constituting a third variety of capitalism on the same level as the CMEs and LMEs, the DMEs or "dependent market economies." The relations between the founding institutions of this new model reflect a strong complementarity. The main characteristic of the DMEs is the weight of foreign direct investment (FDI) in the economy, which creates a real dependence on foreign capital. The dominant coordination mechanism in the economy is then based on intra-firm hierarchies within multinational firms. Industrial relations and labor market hold an intermediate position between LMEs and CMEs, more competitive than in the latter case but less liberal than in the former one, in order to be able to retain the workforce and limit social unrest and the disruption of production chains. Tax revenues are limited by a tax regime favorable to FDI and by tax competition among CEECs, which in turn reduces public spending, especially in the field of education. In any case, most research and development is carried out in countries where TNCs have their headquarters and transferred back into the production processes of subsidiaries. These various elements allow DMEs to develop a comparative advantage in the production and assembly of relatively complex consumer goods, which can then be exported worldwide.

Other authors have applied the régulationist approach of *the diversity of capitalism* and the statistical method used by Amable to Eastern European economies.

For example, Mykhnenko's work (2007) is focused on two countries, Poland and Ukraine, from the mid-1990s to the mid-2000s. Both countries share some institutional characteristics which are designing an original model of "post-communist capitalism" but still "at a formative stage." Their financial system is notably underdeveloped compared to Western European economies. In his article, the author refers to Poland and Ukraine as hybrid forms, "mixed or weakly coordinated market economies" (MMEs). Mykhnenko concludes that the post-communist emerging model in Poland and Ukraine presents a certain degree of institutional complementarity which could (partially) explain the positive socio-economic developments experienced by both countries in the early 2000s.

For her part, Farkas (2011) includes all the new member states (except Croatia) in her study. Her data provide a picture of Central and Eastern Europe around the mid-2000s. She demonstrates that an original model of capitalism is emerging in post-socialist Europe. This "Central and Eastern European model" can be considered as different from other existing models in the "old Europe." Only Slovenia could be related to the Continental model of capitalism. In an attempt to bring this new post-socialist capitalism closer to Amable's typology, it would roughly be somewhere in between the Continental and the Mediterranean models, despite some rare similarities with the Anglo-Saxon model, depending on the institutional area under study. The Central and Eastern European capitalism is the path-dependent outcome of post-socialist transformation trajectories. According to Farkas, the lack of capital, weak civil society, and the influence of international organizations and the EU on structural reforms are the main initial conditions behind that outcome. Therefore, this new model of capitalism cannot be considered as a transient configuration but rather as a permanent one. Unfortunately, the post-socialist capitalism could even be locked in a lesser path of development because of the fundamental asymmetrical position between the old Europe and its periphery in the international division of labor.

Finally, *some specialists have developed their own typologies*, considering that both previous approaches were not adapted to the reality of Central and Eastern European countries.

Drahokoupil and Myant (2011) argue that neither the VoC approach nor Amable's régulationist approach is able to analyze the diversity of capitalism in the region. Indeed, the authors state that the comparative analysis of capitalisms in general has been elaborated on the example of developed countries and that this framework is not suitable for transition economies, because of their specificities (external imbalance, emergent institutional framework, legacy of the socialist system, unstabilized economic relations). In their view, the essential point is integration into the world economy, which is related to the problem of current account deficit financing. They distinguish six forms of "international integration" that can be observed more or less in the different countries during the 2000s. The first one relies on foreign direct investment in high value-added export sectors. It is found mainly in the countries of Central and Eastern Europe. The second is similar to the first one, but without FDI. Slovenia, some Czech companies, and Belarus are involved to some extent. The third depends on subcontracting relations with TNCs and is based on exports of noncomplex manufactured products such as clothing or simple components. It can be observed in the Baltic and Southeastern European countries. The fourth is based on exports of raw materials, especially oil and gas, and concerns mainly the CIS. The fifth depends on current transfers from abroad (remittances, financial aid from international organizations). Finally, the last one refers to growth financialization, where private sector activity and household consumption are fuelled by foreign bank credit. Hungary, Baltic countries, Romania, Ukraine, etc., thus "benefited" from the liquidity abundance in the world in the 2000s. By combining forms of international integration and institutional characteristics (ownership forms, role of the state, etc.), the authors identify then five specific forms of capitalism in transition economies: (second-rank) economies based on FDI (East-Central Europe), peripheral market economies (Baltic states, Southeastern Europe), oligarchic or clientelistic capitalism (Russia and some CIS countries), order states (Belarus, Uzbekistan), and economies based on remittances and international aid (Albania, Moldova, Armenia).

Bohle and Greskovits (2012) also propose a distinct typology, inspired by K. Polanyi's work, to group together the new EU members in the 2000s: the pure neoliberal capitalism, the embedded neoliberal capitalism, and the neocorporatist model. They focus on three important differentiation factors: initial political choices marked by the "perceived" legacy by the actors, the role of uncertainty and crises in the evolution of the pursued strategies, and the influence of transnational actors. The Baltic countries provide a good example of *neoliberal capitalism*. They have radically liberalized their economies: flexible labor market, weak social protection, and tax incentives, all of which satisfy foreign investors. Their exports are based on low value-added branches, which are low-skill labor- and resource-intensive or associated with their activities as TNCs' subcontractors. Their strength is related to their macroeconomic stability, achieved as a result of fiscal and monetary discipline. The Visegrad countries are characterized by *embedded neoliberalism*. Economic liberalization has been less far-reaching than in the previous case, and the welfare state has been partly preserved, thus strengthening social cohesion. A favorable legacy and an incentive policy have fostered foreign capital inflows leading to the development of an export-oriented sector, relatively intensive in skilled labor and technology, in which automobile industry plays a central role. However, macroeconomic stability was not always achieved. Finally, *neo-corporatism* is the privilege of only one country, Slovenia, which combines gradual liberalization, social inclusion (based on social protection and institutionalized bargaining between social partners), and macroeconomic stability.

## Conclusion

The comparative analysis of capitalism has developed substantially since the 1990s, especially in the context of the transition to a market economy in Central and Eastern European countries. Two approaches are currently dominating this field of research: the VoC approach and the régulationist diversity of capitalism. Their application to the

new EU member states has shown their relevance and brought to light new economic models or alternative typologies. Which model seems the most meaningful today to describe the reality of CEEC economies? Dependent capitalism is undoubtedly the one that has generated the most interest and discussion. However, as each model is constantly evolving under the action of both internal and external forces, the Covid-19 crisis will certainly have an impact not only on dependent capitalism but also on other models of capitalism, weakening some or strengthening others.

## Introduction

Diversity, equity, and inclusion (DEI) initiatives present entrepreneurs and small business leaders with opportunities to accelerate the progress that has been made while tackling and correcting significant historical challenges. Funding and profitability are no longer the only concerns for start-ups, who also need to focus on creating environments that are optimal for innovation. If sincerely embraced and authentically practiced, DEI can create a mutually beneficial cycle that

empowers high-performing teams and increases productivity. Drawing on the perspectives, experiences, and skill sets of a broad cross section of society will illuminate opportunities and correct oversights that otherwise would go unnoticed by a business.

Founders are often so focused on making profit at the beginning stages of their venture formation that the important work of shaping culture becomes an afterthought. The strategic plan therefore becomes a great touch point for evaluating and then re-evaluating the intention behind culture design. A founder can create incentives to motivate employees, but the only way to maximize the potential of the organization is for the founder(s) to design a culture that is diverse, equitable, and inclusive from its inception and then revisited whenever the strategic plan is re-evaluated.

Regardless of one's stance on social responsibility or the broader movement for diversity equity and inclusion, numerous studies show that DEI initiatives are good for business and organizational growth. In a survey of the global CEOs, 85% of the respondents who led companies with a strategy for diversity and inclusivity credited it with enhancing business performance (PwC CEO Survey 2015). Elsewhere, Deloitte found that being inclusive could make firms two times more likely to beat their financial targets (Bourke and Dillon 2018). More specifically, within a given business, the diversity of its board and management teams can lead to higher revenue. The potential profit from diversity and inclusion may be the motivating factor for some, but the gains are only possible with the sincere and committed pursuit of the initiatives.

Embedding DEI into operations is no longer just a good idea or nice thing for a business to do; it is essential for business success. This chapter seeks to empower entrepreneurs with the tools that are needed to strategically implement diversity equity and inclusion initiatives which can lead to high business performance. Start-up founders should start by developing a diversity consciousness which will then guide the process of understanding what diversity, equity, and inclusion are, their importance, and how to incorporate such initiatives into the strategic planning process of a start-up company.

## Developing a Diversity Consciousness

We often hear about the importance of developing a diverse mindset and being self-aware. With the advancement of globalization and teams collaborating cross-culturally and from different geographical regions, leaders need to develop diversity consciousness. Leaders should ask themselves; how do I develop my diversity consciousness? Why is this important? What is diversity consciousness? According to Bucher (2015), "diversity refers to all of the ways in which people are different. This includes individual group, and cultural differences. Our ability to recognize, understand, and adapt to these differences is a major focus of diversity consciousness" (p. 2).

Being aware, recognizing and understanding differences is an integral part of developing diversity consciousness. It's important to note that in order to understand diversity consciousness, we must understand the cultural experiences that have shaped us. Culture depicts how we communicate, collaborate, and view our surroundings. Bucher (2015) noted that by understanding various types of cultural backgrounds enables us to interact with others with an open mind. Regardless of your professional goals, developing diversity consciousness is necessary for the current and future workforce. More specifically, leaders will be able to work cohesively with cross-cultural teams, through flexible thinking, developed interpersonal skills, and recognizing and appreciating diverse backgrounds.

Bucher noted (2015) that developing diversity consciousness can "expand your horizon and empower you, promote personal growth and strengthen social networks" (p. 97). Organizations and leaders need to recognize their own cultural encapsulation. Cultural encapsulation by definition is "lack of contact with cultures outside of our own, promotes insensitivity to cultural differences" (Bucher 2015, p. 98).

Start-up companies and organizations need to recognize their cultural biases and cultural encapsulation as they go into the strategic planning process. By doing so, they will be able to understand their own biases and recognize that there is much to learn about other cultures and their traditions, which can ultimately impact target markets, stakeholder relationships, and profit margins. Often, when we are limited in our thinking capacity, we inhibit our own personal development and pass judgment easily. When we are open to learning about other cultures and backgrounds, we not only adapt to new settings, but we also expand our thinking and global acumen. Additionally, it can certainly shape how we communicate and target different demographics for profitability.

Communication and culture often intersect. Culture shapes our views of the world and often how to share information. Specifically, we need to be aware of our biases and recognize our biases when communicating cross-culturally. In order to effectively communicate, we need to understand cultural barriers, intercultural communication, and country-specific gestures. Unfortunately, miscommunication transpires when we are not aware of cultural nuances and traditions. Miscommunication can lead to lack of trust and forming of relationships. To avoid miscommunication, we need to develop diversity consciousness and develop our interpersonal communication skills. Intercultural communication refers to how a message is heard in one culture and how another culture will interpret the intent of the message (Bucher 2015). Finally, it is important to communicate inclusively. What constitutes communicating effectively? According to Bucher (2015), there are a variety of characteristics that constitute communicating effectively such as keeping an open mind, active listening, and understanding how one wants to be addressed, and always being respectful.

Several of these characteristics also lead to the development of cultural intelligence (CQ). According to Earley and Mosakowski (2004), cultural intelligence is "an outsider's seemingly natural ability to interpret someone's unfamiliar and ambiguous gestures the way that person's compatriots would" (p. 1). There are three characteristics of cultural intelligence. The three characteristics consist of head, body, and heart (Earley and Mosakowski 2004).

The head indicates that you are willing to learn about other cultures and learn about traditions/history. The body indicates that you were willing to adapt and learn about various cultural differences and learn about nuances such as personal space and how to greet in that specific culture. Finally, the heart consists of that willingness to continuously learn about other cultures and understand that setbacks are part of the journey (Bucher 2015). Each of these integral parts contributes to the larger context of diversity consciousness. Leaders and organizations must understand that diversity consciousness is not a skill that can be acquired overnight; rather, it consists of learning, developing, growing, and trial and error. The willingness to continuously learn and propensity to set aside biases and judgment are critical to developing diversity consciousness. Diversity consciousness creates the groundwork for start-up companies who seek to understand and embed DEI into the foundation of organizational culture strategic planning. It allows them to go deeper into understanding what DEI is, why it is important, and how to integrate it into the organization.

## What is DEI?

Diversity concerns the harnessing of decision-processing approaches and problem-solving skills borne out of the unique circumstances and conditions that shape individuals' life experiences and applying them to a collective effort. It is not merely an aggregation of specific demographic, identity, or orientation characteristics. The work of diversity, equity, and inclusion is about more than finding the right combination on the demographic Rubik's Cube. In his book *Good to Great*, Jim Collins talks about getting the right people on the bus and making sure they are in the right seat (Collins 2009). However, founders of start-up companies should take this one step further as they seek to create high-performing teams.

Founders should recruit as much interdisciplinary, diverse talent as possible while making sure there are structures of support and inclusion that will leverage these talents for innovative solutions and outputs.

To hire or promote someone merely for good PR or to employ a certain number of underrepresented persons does a disservice to the business, the candidate, and the spirit of DEI. It further exacerbates all of their challenges. For example, the environment can become toxic as people feel isolated and alone, which causes productivity to suffer and sets back the progress of DEI work. While diversity describes group demographics, the degree to which individuals are empowered to contribute to the group is a measure of inclusion (Miller 1998). It does not matter how diverse organizations appear; they will leave human capacity and potential lying dormant without inclusivity.

Equity is more than just providing open opportunity; it involves mitigating the enduring effects of historic inequity by creating structures and support for all individuals to contribute meaningfully to the collective effort. Equity is concerned with just distribution of resources on a societal level (Lewis et al. 2021). It was identified as foundational for truly inclusive and reciprocal partnerships among schools, families, and communities who cultivate the values of mutual respect, democratic participation, critical consciousness, and sustainability (Teemant et al. 2021). Equity supports a cycle of collaboration among stakeholders that want to leverage problem posing and community organizing to address inequities (Teemant et al. 2021). Equity acknowledges systemic racism and bias and its harmful effects in support of the need for thoughtful, systems-level change to build equity-empowered settings that support optimal development for all (Boone Blanchard et al. 2021).

Inclusion involves embracing the differences in approach, perspective, and style that make people unique, not merely tolerating them. This invites an ever-expanding conception of what it means and looks like to be a part of the collective effort. When diverse individuals have their voices (along with their ways of doing things) valued equally, only then are they truly included. These tenets are captured in the literature. "Inclusion is the combined state of organizational affairs that seeks, welcomes, nurtures, encourages, and sustains a strong sense of belonging and high performances from all employees" (Goosby Smith and Lindsay 2014, p. 13). Inclusive environments welcome and value all stakeholders, which creates a sense of belonging and meaningful work or patronage.

The three elements cannot be separated. Without diversity, there is nothing and no one to include. Moreover, if that inclusion is not equitable, nothing has changed, and the organization has merely created a transparent facade decorated with empty words. Diversity, equity, and inclusion combined can create environments for high-performing teams to innovate at the highest levels, which becomes enticing for start-up companies during the strategic planning process. But founders must first have a commitment that stems from an understanding of why DEI is important.

## Why DEI Matters

**Job equity**. DEI work in start-up companies could counteract across institutions that have long-standing histories of lacking job equity. Despite the progress that has been made in diversifying corporate boards, leadership and senior roles remain an area of inequity that is ripe for DEI efforts. For example, it is often a struggling or troubled business that will hire a woman to be the CEO, finally break through the glass ceiling, and become the chief executive of a Fortune 500. This "glass cliff" provides women with an opportunity that they otherwise would not have received but does not place them in a position to excel (Bruckmuller and Branscombe 2010).

Even a cursory glance at American professional sports reveals a similarly troubling trend. The NBA and NFL player ranks are filled with Black players, and many coaches are former players, yet both leagues have a lack of Black head coaches. When Black head coaches are

hired, it is frequently for underperforming franchisees that persistently struggle. When they manage to survive more than a few seasons and achieve some success, they are replaced a season before the team wins a championship. Even if these coaching replacements were coincidences and just what the respective teams needed, it does not explain the overall absence of Black coaches in leagues where coaches with less experience and multiple firings receive head coaching opportunities every season.

The NFL has taken steps to diversify its head coaching and team decision-maker ranks. The results have been mixed but instructive for others, particularly entrepreneurs. Nearly 70 percent of the NFL players and over a third of the assistant coaches are people of color, yet only one minority was hired in the six head coaching vacancies heading into the 2021 season (Reimer 2021). However, the total number of Black general managers more than doubled as three teams added new executives (Maske and Kilgore 2021).

Despite the guidelines and incentives to encourage diversity in teams' hiring choices, known as the Rooney Rule, the league's challenges persist. Requiring teams to conduct interviews with minority candidates and offering team incentives for hiring minority candidates removes some barriers to diversity present across industries, namely, access to networks and development opportunities. Making a diversity hire just for the incentive will not lead to success in any workforce. Hiring decisions must be based on the belief that the person will add value to the organization. Ultimately, whether its football teams or start-ups, owners have a role in deciding how the discourse on DEI develops.

In a review of the paths taken to head coaching positions in the NBA, a pattern of fewer former players becoming coaches has emerged in recent years (Pelton 2021). It is ostensibly possible for a league with predominantly Black players to have fewer Black head coaches as teams move away from hiring former players as coaches. However, even with the increase in head coaches that are not former players, Black representation continues to lag. The dearth of Black head coaches could stem from Black candidates' preferences as seen in some studies of the pay gap for women (Bolotnyy and Emanuel 2019), or there could be larger DEI problems afoot as seen in other industries. Unlike the NFL, the NBA does not have a Rooney Rule but has a track record and current success on the diversity front. In the modern era of major professional sports, the NBA had the first Black head coach, and The Institute for Diversity and Ethics in Sport awarded the league an A− overall and an A+ on racial hiring on its 2020 Diversity Report card (TIDES 2020). Although Black head coach hiring was down, assistant coach and league office hiring was up for the NBA which potentially points to the acceleration of some job equity within an enterprise that makes DEI work a priority.

**Pay equity**. Just as inequities exist for underrepresented populations with securing some jobs, the pay they receive while in various positions can present another challenge. On average, women earn around 82 cents for every dollar paid to men (National Partnerships 2020). The gap is more significant for women of color working full-time year-round. For example, Latinas only make less than 60 cents, while Black women earn slightly more at 63 cents (Bleiweis 2020).

However, the gender pay gap issue highlights the nuance and subtle complexities of addressing DEI issues. When controlling for other variables like education level, work experience, and job type, people of color, most notably Black women, still earn less than white men (Payscale n.d.). In the right combination, controlling for certain variables can explain the gap entirely (Bolotnyy and Emanuel 2019).

Elsewhere in a study of the earnings gap in an even more controlled unionized setting, the gap was explained entirely by women's schedule preferences (Bolotnyy and Emanuel 2019). When the employer implemented new policies to correct some problems, they further closed the earnings gap. Still, they decreased the women employees' well-being by making the job more constricted when they preferred the flexibility.

There are differences in job type and career track, but creating opportunities, not artificial

outcomes, means putting structures in place to shrink the gap even without controlling for variables. In short, getting more women, particularly women of color, into higher-earning roles can be achieved through DEI initiatives. Everyone, including the businesses, will benefit. The earnings gap is not just a women's issue. Nearly every man is related to a woman affected by the pay gap or is in a position to do something about it.

## A Setting for DEI

The conventional wisdom holds that small business is the driver of economic activity and job growth. The argument's validity notwithstanding, small businesses possess several features that often make them fertile environments for advancing DEI initiatives. Larger, more established institutions may enjoy more staff, customers, and a generally wider audience. However, they can also become ossified by the traditions and norms that emerged over the decades spent establishing that employee base and business reach.

Conversely, small businesses, which often benefit from young entrepreneurs' dynamism, are unburdened by a history they have not yet formed. Working with a smaller workforce, if much of one at all, entrepreneurs have a greater opportunity to act as a change agent and more rapidly challenge the status quo. Being nimble and responding to change creates flexibility on diversity and inclusion issues that otherwise may not exist for a business owner. Such actions may not be as dramatic as shutter stores nationwide for a day to train staff on DEI issues, but it may prevent the need for those drastic measures. While small businesses may not employ as many people as large corporations, they have an invaluable role in setting the broader tone for a societal perception of diversity equity and inclusion.

## How to Incorporate DEI

**Pipelines**. With the myriad of other concerns and uncertainties related to launching or operating a new venture, it would be tempting and understandable to rely on preexisting friends and associates to staff and advise the business. However, taking time to look beyond one's immediate network could establish a new pipeline of diverse candidates to work in and counsel the company. Start-up founders are reliant on teams to launch new ventures, and the investment into DEI pays off as the team becomes high-performing, leveraging diversity to create innovative solutions for complex problems that arise along the way.

**Cohorts**. Start-up companies should create cohort models that allow people to operate in teams that embed inclusion into the DNA of the organizational structure. Google's people analytics team conducted a study in 2012 to quantify the components of a high-performing team, which include psychological safety, dependability, structure and clarity of roles, meaning, and impact (Duhigg 2016). This formula can be used to guide cohorts with the infrastructure for inclusion from the company's inception.

**Interviewing**. Even after establishing new pipelines and networks to filter candidates into the business, the process of selecting the right employees presents another opportunity to incorporate DEI practices. For the entrepreneur, it may seem reasonable to have an unstructured interview with a prospective new hire to determine if he or she will be a good fit for the job, but having other members of the organization participate (current staff or advisors) in the process can be beneficial.

Unstructured interviews are not the best predictor of subsequent job performance. However, in a more structured selection process, a more diverse panel of interviewers or application reviewers may assess specific characteristics that applicants have as they relate to the company's broader DEI goals and objectives. In a hiring situation, this may manifest itself by the blind spots regarding particular attributes like balancing work and life, or a single interviewer's biases discussed during panel deliberations before rendering a decision on an applicant.

**Training**. As with other business areas, there is a role for training in the DEI work of a new

venture. However, it comes with a few caveats. The activities must remain voluntary. Although it might seem like the people who need to be in training will not go if it is not mandatory, it is not a problem. If everyone else in the organization is bringing the skills and attitudes learned from the trainers into the business's day-to-day interactions, the training will eventually reach everyone. The leader must find ways to integrate the concepts learned into the workforce's daily life – perhaps with an organization-wide reminder email about the presentation or some other visual display that reinforces the message in people's minds. Another way to ingrain the DEI initiative is not to rely on perfunctory one-time actions to check on a list.

When training, even if repeated, does occur, it remains prudent to interpret improvement after training with caution. Typically training is sought or recommended after there has been a dip in or sustained poor performance. Improvement could be attributable to something other than a particular seminar or workshop. Therefore, seeking evaluation and feedback from the staff is critical.

**Mentoring**. Valuing a diverse array of lived experiences and the different problem-solving approaches they generate will challenge expectations and norms. To reap the benefits of diversity, some investment hiring or promotion candidates will require mentoring to maximize the impact they can bring to the company. While their experiences have prepared them to perceive solutions and opportunities, others may not; a history of marginalization has left many locked out of the networks and career tracks that shape company policies and industry directions. It would be disingenuous to reduce a recommendation of mentoring as part of DEI initiatives to a debate about qualifications. Instead, it is a call for raising the scope of the standard of what it means to be qualified. It must mean more than attending the right schools or having the proper resume entries.

**Fail better**. The words of a twentieth-century Irish novelist may not immediately spring to mind when discussing diversity equity and inclusion. However, for entrepreneurs, the words from his book Worstward Ho can be quite instructive. Although the lines "Try again. Fail again. Fail better." are usually associated with the need for persistence in technology companies, the words are instructive to all businesses. The book is a bit darker and less motivational than the often-repeated phrase suggests. Similarly, using the disadvantaged resilience and survival strategies honed in bleaker circumstances to change the way firms operate can benefit industry and society. Regardless of how sincere and committed to DEI, the work is never done. There is always more to learn because change is constant. What was acceptable as diversity a decade or two ago may be insufficient today and even less so tomorrow or a year into your start-up. Therefore, it is incumbent upon the entrepreneurs to build into their start-up plans a strategy for continuous development and awareness-raising for leaders, employees (e.g., diversity officers), and advisors.

**Courage**. Although it sounds simple, pursuing diversity equity and inclusion is not easy. It will require a certain degree of introspection and self-examination before pursuing interactions that can be mutually beneficial. Sometimes good intentions will not be sufficient. If leaders are willing to engage in genuine dialogue and support a course that others help set, change may be possible. It is not merely a matter of listening to new ideas and voices. In short, DEI will require the development of comfort with discomfort.

The historically marginalized person in the firm cannot be forced or expected to start the conversation. Those in power must be willing to take the first step, which may not mean implementing a solution but allow others to do so. This change may mean losing a skilled employee or a customer segment that cannot handle change. Those losses would only be temporary, genuinely felt up, ultimately replaced by new growth.

**External**. Although it is more straightforward to make progress by making changes within the workforce and leadership of a business, entrepreneurs should be mindful that DEI efforts can extend beyond hiring and promotions. Just as steps are taken internally to ensure that new people are brought into the business, it is important

for start-up companies to consider DEI when contracting with vendors and suppliers. Founders should look beyond the familiar networks and associations when building DEI into the fabric of the organization's infrastructure.

## DEI and Society

Rather than reflexively resisting DEI initiatives emanating from civil society, the entrepreneur should use it as an opportunity to further social innovation. Whereas the creation of new inventions and products has been the domain of scientific or technological innovation, the development of solutions to complex systemic societal problems has fallen to social innovation. Some issues cannot be resolved with faster processors, increased efficiency, or expanded automatization. Social innovation leverages all three dimensions of society – the public sector, private business, and civil society – to generate new ideas that lead to progress across all boundaries.

It is important to distinguish social innovation from the more popular social entrepreneurship. The zone of activity between any two segments of society creates opportunities for unique social innovations (Nicholls et al. 2015). For example, boundary-spanning between civil society and private business led to social enterprises that are expressly created to solve a social problem. Conversely, social innovation is driven by the exchange of ideas and values. In the latter category, entrepreneurs may develop a new solution to a social problem, but the business was created and exists to meet some other need. Deciding to be a social enterprise or a business that addresses social concerns by acting responsibly is another element of the strategic planning entrepreneurs and small business leaders must consider during their start-up.

Concerns that DEI initiatives will change business are misplaced. Any degree of progress involves Schumpeter's (1942) notion of creative destruction – the birth of a new order through the destruction of the old structure. This continuous process does create value for some and losses for others but the market as a whole benefit just as horse and buggy operators gave way to automobiles or bank tellers to ATMs if innovators in business (i.e., entrepreneurs) incorporate diversity equity and inclusion into their plans so the whole of society can move forward, faster and farther than it has before.

## Conclusion

Today's business environment is often described by using the term VUCA which stands for "volatile, uncertain, complex, and ambiguous." Researchers suggest that VUCA environments present new challenges inherent in strategic planning as organizations face constant change. These VUCA conditions are key to understanding the nature of dramatic changes that leaders face today (Bennett and Lemoine 2014). Understanding and appreciating diversity, equity, and inclusion is a natural extension of preparing start-up companies to thrive in these VUCA situations and changing markets. The more infrastructure an organization has to leverage diverse, interdisciplinary teams that are inclusive, the more innovation, creativity, and agility in the constantly changing environments.

The purpose of DEI work is to foster inclusive environments where all employees can grow and thrive. As start-up companies create strategic plans, they have an opportunity to build inclusive culture into the fabric of the organizational structure in a way that values and encourages diverse perspectives, as well as new ways of thinking about things. A dedication to DEI has to start from the top with a commitment from leadership that permeates throughout the organization. Diversity of thought creates avenues for innovation and creativity, and diverse perspectives can lead to better decisions that make companies more adaptable in an ever-evolving business environment. Start-up companies have an opportunity to change the trajectory of DEI by setting an example as they make diversity and inclusion a top priority through strategic planning and regularly reviewing the internal processes and programs

that ensure a commitment to promoting diversity, equity, and inclusion.

Founders are usually laser-focused on profit during the formation stages of strategic planning. However, if a start-up company fails to integrate DEI into the infrastructure of the organizational DNA, a window of opportunity has been forfeited. The work of DEI cannot become an afterthought, it must drive the organization's success by intentional recruiting and hiring of diverse perspectives in a way that fully values and embraces diversity for innovation and change. Founders who make DEI work a critical company of strategic planning reap the rewards down the road as teams utilize the safety of inclusion to bring the best versions of themselves to work. This creates the benefits of high performance, leading to organizational success.

# Doctoral Education Policies in South Korea

Jisun Jung
Faculty of Education, The University of Hong Kong, Hong Kong, Hong Kong SAR

## Synonyms

Graduate education; Knowledge production; PhD; Postgraduate education; Research and development; Research system

## Definitions

Doctoral education is the highest level of education, and its degree is awarded to someone who has strong disciplinary knowledge, creates and disseminates original knowledge in the field, and enables to apply his/her knowledge to practice. Curriculum and requirement for doctoral education and career paths of degree holders vary across the higher education systems.

## Introduction

Doctoral education is a key driver of building a national academic research system and training a highly educated workforce in the knowledge economy. It educates people to conduct original research and brings national innovation across academia and industry. It is important for the government to design and implement powerful and efficient public policies for doctoral education to support the nation in the global knowledge competition (Neumann and Tan 2011). Thus, doctoral education has become a matter of national science policy in terms of research and development, funding schemes, internationalization, and collaboration with industry or overseas universities in most advanced countries. It has also created a need at supranational levels to explore how national systems successfully integrate knowledge and innovation systems and how they organize incentives, regulations, and measures according to the global standard (Bao et al. 2018). This has caused a change in doctoral education by intensifying international competition for research quality and productivity around the world.

It is not difficult to find many achievements of higher education in South Korea (hereafter Korea) during the last six decades. Higher education enrolment was the highest in Korea among OECD countries (98% in 2008) based on high private investment. Most higher education institutions, about 85%, in Korea are private. Individuals were willing to invest their private resources for their higher education as it guaranteed advantages in the labor market after graduation during the growing economy in Korea. The development of higher education was aligned with Korea's industrial structure and the demands of the labor market from the 1970s to the early 2000s. After the 1997 Asian financial crisis, Korea's economic structure was transformed into a knowledge-based economy, and the higher education sector was expected to focus on creating a highly educated workforce (Hur and Bessey 2013). As a result of these new expectations, since the late 1990s, the government has created strong policy initiatives, including research and development (R&D) policies and world-class university (WCU) initiatives. Consequently, knowledge production measured by the number of publications and citations has increased significantly in a short period. Doctoral education has been a major public policy for research system building in Korea. This chapter aims to address the history, development, and future agendas of doctoral education in Korea. How has doctoral education evolved in Korea? What was the context of public policies in doctoral education? What considerations should be taken into account in future public policies?

## A Brief History of Public Policies in Korean Doctoral Education

As in other developing countries, the initial stage of doctoral education in Korea relied heavily on importing advanced knowledge from developed

countries and translating it into a national academic community (Shin and Lee 2015). Knowledge production was partly achieved in public research institutes based on government financial support, while knowledge production at the doctoral level in the higher education sector was very limited. In response to economic development and growing demand for higher education, the Korean government has developed strong public policies for universities to develop their own doctoral education, which has expanded from a small number of research-intensive universities to a larger number of universities. According to the Korean Ministry of Education (2005), about 200 4-year universities in the country are classified as Research University I, Research University II, Teaching and Research University, and Teaching University. This typology was based on the number of publications, number of doctoral students, and the amount of government research funds received. Twelve universities are classified as Research University I; 16 universities are classified as Research University II; and 30 universities are Teaching and Research universities. Doctoral degrees were initially offered only in Research I and II Universities. As higher education developed, some Teaching and Research Universities gradually began to also offer doctoral degrees.

Shin and Lee (2015) divided the evolution of research universities in Korea into three periods – incubating (1960s–1970s), transformative (1980s–1990s), and institutionalization (1999–present) – and described how Korean universities have shifted their main mission from teaching to research. Similarly, Jung (2018) divided the evolution of doctoral education in Korea into three periods: reliance on overseas doctorates (pre-1980s), quality enhancement of national doctoral education (late 1980s to mid-1990s), and global challenges and competition (late 1990s–present). A brief history of the public policies for doctoral education of each period is given as follows.

*Before the 1980s*: After the independence from Japanese colonialism in 1945, Kyungsung Imperial University became Seoul National University (SNU), the first national university. It was the first comprehensive modern Korean university offering undergraduate and graduate degree programs. The first graduate school was opened in 1946 at SNU, although it had master's degree graduates only until 1949. According to UNESCO (1985), the first doctoral course in Korea was opened at SNU in 1959. As the curriculum and the number of qualified teachers for doctoral education were insufficient, most university academics were overseas doctoral graduates, mainly from the USA and Japan (Shin and Lee 2015) during this period. Research was entrusted to a few public research institutes focused on applied research for economic development. As the government did not have enough funds, these institutes had to rely on foreign loans to develop their research agendas and support the national economy. When the government realized the importance of knowledge production, it established the Korea Institute of Science and Technology (KIST) in 1966 and the Korea Advanced Institute of Science (KAIS) in 1977, which became a research-intensive university of science and technology in the 1980s. The government still had to sponsor many talented students to join overseas universities for their doctoral study in the 1980s. After the 1980s, with economic growth and the massification of higher education, the number of doctoral degree recipients increased, and national doctoral education gradually expanded to major private and local public universities (Jung 2018). During this period, the government substantially increased public investment in the national research system and emphasized the role of higher education in knowledge production.

*Late 1980s to Mid-1990s:* Since the late 1980s, the quality of research training system has attracted more attentions of public policymakers. National research capacity building was also supported by industrial development and economic growth in the 1980s. As a result, the government launched diverse public policies, such as the General Objective Basic Research Programme and the Special Objective Basic Research Programme, to support basic and applied research in the higher education sector and public research institutes (Lee and Jung 2018). They also implemented schemes to build research-focused universities in 1986, increased the number of

scholarships for doctoral students, and developed incentives to publish in international journals. Some research universities successfully used these schemes to attract talented students, contributing to the establishment of the national system of doctoral education. The quality of the research system, including at the doctoral level of education, significantly improved during this period.

*Late 1990s to the Present:* After the 1990s, global competition for the research system became important, for example, the global ranking system. Government policymakers paid more attention to the global reputation of Korean universities and their performance, and the principle of "selection and concentration" in the research system became common (Byun et al. 2013), which means that the government selected high-performing institutes for resource allocation. In 2010, public expenditure on education in GDP was 7.6% in Korea, above the OECD's average of 6.3% (Pinheiro and Pillay 2016).

One of the most representative policies in higher education during this period was the Brain Korea 21 (BK 21) launched in 1999. US$1.2 billion was invested over 7 years during the first stage of the project (1999–2005). The policy aimed to enhance research infrastructure and more importantly to upgrade graduate-level training and academic productivity. The policy proceeded to its second stage (2006–2012) with more concrete objectives, which was to place Korea among the top 10 countries in terms of number of publications, knowledge transfer, technology transfer, and support of more than 20,000 graduate students (Hur and Bessey 2013). The third stage of the project (2013–present) is currently underway. Since its implementation, the policy has successfully increased the number of doctoral graduates, especially in science and engineering, by providing financial support in the form of scholarships. It has also supported graduate assistantships and overseas experiences, including participating in research exchange programs and attending international conferences (Lee and Jung 2018).

The government launched other policies that focused on efficiency and the performance of university research projects. The world-class university (WCU) project in 1999 resulted in large-scale recruitment of international academics. For this project, the Korean government invested US$750 million over 5 years until 2008 (Byun et al. 2013). Doctoral students were among the main beneficiaries and were asked to perform better and to be more internationalized (Jung 2018). They improved the overall quality of research system building in Korea and helped academics and doctoral students to be better equipped for research activities and to participate more actively in the international scientific community.

## The Challenges of Doctoral Education Policies in Korea

Doctoral education in Korea has significantly improved in terms of scale and quality thanks to the strong government policies implemented since the late 1990s. However, important challenges must be considered for future development. For example, it is worth asking whether the growth of doctoral education over the last two decades has actually improved the quality of the research system, as public policies have been dominated mainly by quantitative measurements driven by external stakeholders' views. Moreover, due to the rapid increase in the number of doctoral degree holders, there is a mismatch issue between the number of degree holders and their job positions in academia. With regard to the job market for doctoral degree holders, there are also several issues, such as the preference for overseas doctoral graduates. In addition, public policies based on too much emphasis on competition can cause an imbalance in the development of academic disciplines and the reputation and location of universities and neglect local issues. More importantly, public policies in doctoral education need to consider future agendas to prepare for the aging society and the fourth industrial revolution. To do so, doctoral education policies should be discussed in the context of the academic research system as a whole. Key challenges are addressed below.

*Quality enhancement of doctoral education through long-term public policy implementation:* The increase in the number of doctoral degree holders has resulted in the growth of the national

knowledge production system. The Korean research system has been acknowledged over the last three to four decades, from knowledge importer to knowledge producer. It is clear that key public policies have contributed to increasing Korea's research performance and visibility globally over a short period. For example, research outputs from Korean universities after the BK21 program increased by about 150% and more importantly changed the university culture to a performance-driven culture (Shin 2009). However, too much emphasis on research productivity is often criticized for not stimulating high-quality research. How can we maintain the global standard of the doctoral training system to produce high-quality and impactful researchers? How can we accurately assess the quality of research and monitor the quality of doctoral education? Previous major public policies in the research system tended to focus on short-term performance based on global ranking tables, mainly on the number of papers published in English journals, regardless of their value and contribution to the literature (Byun et al. 2013). In terms of topics and budget support, future public policies in doctoral education and the research system in general must consider a long-term vision and the quality and effects of research through policies, such as strong support for basic research fields.

*Overcoming managerialism when implementing public policies*: As the government has implemented diverse public policies to support the research system and doctoral education, these policies are often contractionary, making it difficult to set a priority. For example, as Jang et al. (2016) pointed out, some public policies in science policy, such as the WCU project, require overtly strict regulation of implementation at each stage, which is ironic in the sense that high-quality research results from the autonomy and convergence of researchers. Policymakers expect researchers to produce cutting-edge research outcomes, while requiring a certain number of publications or patents, which are normally incompatible. Future policies need to take into account the factors that motivate and stimulate impactful research and improve flexibility in implementation.

*Internationalization of doctoral education not by completion but by collaboration*: It is undeniable that the knowledge production system is globalized in today's world. The Korean government has implemented several policies to internationalize doctoral education, such as promoting international publication, publishing with international co-authors, and sending doctoral students to international conferences and overseas institutions for internships. These policies have provided meaningful experiences for doctoral students and should be expanded in the future, taking into account the collaborative and innovative effects of learning experiences. For instance, one of the strategies proposed by Zweig et al. (2008) is the diaspora option, a national strategy to encourage brain circulation, which supports collaboration between Korean scientists in Korea and abroad to share the problems of national agendas and collaboration between national and foreign scientists to maximize their diverse resources and strengths.

*Diversifying career paths for doctoral degree holders*: The number of doctoral degree graduates in Korea has exceeded the number of faculty positions since the late 1990s (Lee and Jung 2018), and the academic job market is becoming more and more competitive. With the number of university students decreasing due to a low birth rate and public budget cuts, universities are highly reluctant to hire new tenure-track academics. In contrast, the number of doctoral degree holders from domestic universities and the number of overseas returnees are increasing. These two facts have led to a serious mismatch between doctoral training and the requirements of the academic job market in the higher education sector and have drawn attention to the issue of the high unemployment rate of doctoral graduates in recent years. Most doctoral degree holders take up various jobs outside of academia before taking up academic positions, and many have never held academic positions. This is a global phenomenon, especially in advanced countries, due to the oversupply of doctoral degree holders. As a result, doctoral graduates today are expected to consider diverse career paths, including nonacademic careers (Hancock and Walsh 2016). Santos et al. (2016) pointed out that focusing solely on academic positions for doctoral degree holders in today's market limits their career path

perspectives. Instead, they must look for diverse career paths. Public policies need to support them to work in different industry sectors and encourage them to contribute to the knowledge production system as a whole.

*Objective evaluation and recruitment system for overseas and domestic doctoral degree holders:* There is another policy issue regarding the job market for doctoral degree holders in Korea. Despite the improvement in the quality of the national doctoral education system, the academic job market in Korea, especially in research universities, tends to prefer to hire overseas doctoral graduates. There is a long tradition of reliance on overseas graduates in the Korean higher education system. About 40% of Korean university academics earned their doctoral degree from a foreign university. These overseas doctoral graduates have made a significant contribution to the knowledge production system in the initial stage of building a national research system, at the same time bringing transnational identity capital across borders (Kim 2017). In general, foreign degree holders are highly regarded in Korean academic society and have competitive advantages when entering the labor market (Jung 2018) even if recent studies have shown that domestic doctoral degree holders have also significantly improved their competitiveness in research capacity (Jung 2018). Public policies must consider how to organize an objective evaluation and recruitment system for doctoral degree holders in the job market.

*Balanced investment between institutions and disciplines:* Public policies have significantly improved resource allocation for doctoral education. However, the investment of resources has been largely dominated by a few elite institutions and specific academic disciplines, mainly in STEM fields. Byun et al. (2013) found that the top five universities in Korea (SNU, KAIST, Yonsei University, Korea University, and POSTECH) received about 50% of the research funding for the BK 21 project and the WCU project. Institutions must develop their own mission in doctoral education and redefine the goals of doctoral education considering industrial and local requirements and structures. In addition, there is a regional imbalance of universities in Korea as pointed out in previous studies, such as Byun et al. (2013). A large proportion of financial and human resources are concentrated in large universities located in the capital. Other regional universities have difficulty in research grant competition and in attracting talented graduate students. Public resource support needs to be fairly distributed, especially when small universities in local regions produce significant outcomes.

The imbalance of public investment is more serious in terms of academic disciplines. Most major public policy schemes have concentrated on science and engineering, although the government has launched large-scale public policies, including the Social Science Korea and Humanities Korea schemes, to improve the balance between academic disciplines since 2010. Applied science and engineering, which can improve research performance in a short period, have benefited from the largest public investment. The imbalance between academic disciplines is also reflected in the favorable working conditions of doctoral degree holders in STEM fields. For example, doctoral degree holders in science and engineering tend to occupy more full-time or tenure-track positions than graduates in the humanities and social sciences (Lee and Han 2010). Designing and implementing public policies that balance public investment between academic disciplines is necessary in the future. The excessive emphasis on investment in the internationalization of doctoral education has also led to an unbalanced development between international and local values. For example, publications in local languages may be considered less important than those published in English, regardless of their value and contribution to the literature (Byun et al. 2013). Fostering public policies in doctoral education that can integrate the academic community nationally and globally is needed.

## Policy Recommendation

Despite the considerable progress of the doctoral education system in Korea resulting from a number of successful policy implementations, this chapter pointed out several challenges that the knowledge economy has posed. The chapter concludes with the following policy recommendations.

*Place a research excellence frame in doctoral education policies*: Before arguing about resource investment, the research environment integrates a framework of research excellence. Rigorous academic standards should be created in their doctoral education process, from admission through graduation. The aims of doctoral education should be defined nationally and institutionally as training professionals who are creative, innovative, and risk-taking for the future knowledge economy.

*Align doctoral education policies within a national system for innovation*: Currently, doctoral education policies are planned and implemented by different stakeholders from education and science sectors. Key policies from different government agencies should be reviewed and integrated for effective implementation to support more talented doctoral students with better educational conditions.

*Create better synergy among policy organizations*: Government policies and institutional polices should be aligned and supplement one another. As universities have increased responsibility for doctoral education, diverse institutional practices should be open and best practices shared. More autonomy should be given, as appropriate, when there is an innovative approach to doctoral education.

*Encourage mobile experiences and collaboration at different levels*: Doctoral education policies should encourage collaboration across national boundaries, institutions, sectors, and disciplines. First, international collaboration is a key strategy to enhance the quality of doctoral education and provide diverse research experiences in a global knowledge society. Doctoral education policies should, for example, provide opportunities for international networking, research project collaboration, participation in international conferences, short- and long-term visits to overseas institutions, etc. Second, collaboration with industry should be encouraged, such as sharing research training, funds, research equipment, and knowledge transfer activities. Engaging nonacademics from relevant industries in research projects with doctoral students can be an effective way for them to learn applicable field knowledge and transferrable skills. Third, regional collaboration is essential to help reduce the resource gaps between large regional and small local universities. Fourth, interdisciplinary research collaboration should be more actively encouraged in an open research environment.

*Track recent doctoral graduates' career trajectories*: The number of doctoral degree holders is increasing, but there is a lack of systematic data on how many are produced; they go after the degree completion and how they are employed. Policy stakeholders should follow the career paths of doctoral degree holders to analyze and predict the contribution of knowledge production of highly skilled people in the national research system.

*Make funding distribution more transparent:* The scale of the research and development (R&D) investment must remain steady to maintain the quality of the research system and doctoral education. However, research funding at different levels (institutional, project, research unit, and individual) should be reviewed and effectively distributed in a transparent method to ensure fairness and accountability.

*Maintain consistent quality assurance policies*: Accountability procedures must be established within throughout doctoral education. They must enhance the quality of the research environment and promote accountable procedures in admission, supervision, and graduation requirements. It is also important to consider consistency in the strategic plan of each institution and its evaluation criteria for doctoral education.

Finally, doctoral education policies should be understood within a national research system as a whole. Indeed, a successful academic research system, of which doctoral education is a part, can only be achieved when the research environment, the knowledge function, social change, and national government policies are integrated well.

## Conclusion

This chapter has focused on the evolution of public policies regarding doctoral education in Korea

and the social contexts of policy development. The chapter has concluded with policy recommendations to enhance the doctoral education system. Doctoral education policies in Korea have shown significant progress during the last five decades in terms of recruitment of highly qualified students, providing better quality of training system based on strong government funding supports. However, the system still has areas to improve such as unbalanced investment between institutions and disciplines, strong managerialism culture, lack of international visibility, narrow approach for career path for degree holders, and lack of continuous policy support for quality enhancement. The chapter has provided policy recommendations such as aligning doctoral education policy within a national innovation system, creating more research collaboration beyond national boundaries and sectors, and encouraging more mobile experiences, building transparent funding distribution mechanism, and creating sustainable research culture.

**Acknowledgments** The first part of this paper, "A Brief History of Public Policies in Korean Doctoral Education," is a modified and restructured version of the author's previous paper, "Domestic and overseas doctorates and their academic job entries in South Korea," published in *Asian Education and Development Studies* in 2018.

Consumer protection; Dodd-Frank Act; Financial industry; Financial regulation; FSOC; Title IV; Volcker Rule

The Dodd-Frank Wall Street Reform and Consumer Protection Act ("the Act") became the law of the land with the President's signature on July 21, 2010 (Dodd-Frank Act, Pub. L. No. 111–203, 124 Stat. 1376, (2010)). The Act is widely considered the most far-reaching legislative change for the financial industry, since the enactment of the Securities Act of 1933, the Securities Exchange Act of 1934, the Investment Company Act of 1940, and the Investment Advisers Act of 1940. Because the Act affects every financial institution in the United States and beyond, the financial industry was required to address the tectonic shift in banking, securities, derivatives, executive compensation, consumer protection, and corporate governance.

The most significant changes mandated by the Dodd-Frank Act affect several core constituents and industries. The Act created a new resolution regime for large financial companies; affected, among other things, the oversight and supervision of financial institutions; and created the consumer financial protection bureau, an agency tasked with the implementation and enforcement of consumer protection laws. The Act also effected substantive changes in the regulation of over-the-counter derivatives, introduced more stringent regulatory capital requirements, implemented changes to executive compensation practices and corporate governance, reformed the regulation of credit rating agencies, incorporated the so-called Volcker Rule, and effected major changes in the securitization market. Most significantly, the Act required registration of advisers to certain private funds in Title IV.

The Act in its respective Titles encapsulates fast changes for the financial industry. The Act under various titles entails:

- Significant systemic risk regulation;
- An orderly liquidation authority;
- The Volcker Rule;
- Swaps pushout rules;
- Bank capital requirements;
- Rules on derivatives;
- Regulations of advisers to hedge funds and others;
- Investor protection and improvements to the regulation of securities;
- The elimination of the OTS;
- Deposit insurance reform;
- Amendments to the regulation of bank and thrift-holding companies and depository institutions;
- Rules on payment, clearing, and settlement;
- A new bureau of consumer financial protection;
- Emergency stabilization and federal reserve governance;
- The Pay It Back Act;
- Substantive rules governing insurance.

The Act's systemic risk regulation focuses on granting a newly created regulatory substantial authority, Financial Stability Oversight Council (FSOC). FSOC serves as an early warning system to improve oversight of the financial system, to identify risks in financial firms and particular market activities, and to coordinate prudential standards among several governmental agencies. The FSOC is tasked with the identification of systemically important nonbank financial companies (SIFIs). SIFI designation would bring a company under regulation by the Federal Reserve and trigger the application of heightened prudential standards.

The Act also introduces the new Office of Financial Research (OFR). The OFR serves as the information-gathering arm of the FSOC and has the authority to collect substantial amounts of information from financial market participants, backed by subpoena power and the Freedom of Information Act.

Another important new element introduced by the Act is its orderly liquidation authority that replaces the Bankruptcy Code and other laws pertaining to the liquidation of financial companies. The new authority is modeled to a significant extent on Sections 11 and 13 of the Federal Deposit Insurance Act. The liquidation authority attempts to balance the objectives of bankruptcy and consumer protection laws with the objectives of public confidence, risk taking, and preserving and restoring financial stability.

The Act also contains the so-called Volcker Rule. The Volcker Rule curtails banking entities' abilities to sponsor or invest in a hedge fund or private equity fund or engage in proprietary trading. The rule also requires SIFIs to carry additional capital.

Under the so-called swaps pushout rule, the Act prohibits certain types of federal assistance to major swap market participants and certain swap dealers. Under the rule, an insured depository institution can be affiliated with a swaps entity and still receive federal assistance, but it prohibits the use of taxpayer funds to prevent receivership of any swap entity resulting from swap activity.

The Act also regulates derivatives transactions via mandatory clearing through centralized clearing organizations, new categories of regulated market participants, and the pushout from banks to bank affiliates of swap activities. Particular rules in this title pertain to swaps, security-based swaps, and mixed swaps.

The Act includes several provisions pertaining to investor protection and improvements to the regulation of securities. This miscellaneous assortment of provisions is intended to strengthen broker-dealer regulation and improve investor protection. For example, the Act disqualifies felons and other bad actors from Regulation D offerings and requires the SEC to compensate whistleblowers, among other whistleblower protections.

Credit-rating agencies and especially nationally recognized statistical rating organizations ("NRSROs") are also targeted by the Act. The Act requires NRSROs to be more transparent in their rating procedures and methodologies, increases internal controls, provides the investing public with a private right of action against NRSROs, and gives the SEC more leeway in enforcement and examination.

Credit retention requirements are another major topic under the Act. Because Congress saw securitization as a major contributing factor to the financial crisis, the Act requires securitizers to retain a portion of the credit risk from asset-backed securities.

Compensation arrangements for executives at financial institutions and public companies are also governed by the Act. While the Act does not impose concrete limits and prohibitions on executive compensation, it does include principles-based provisions on executive compensation. Such provisions include a mandatory non-binding say-on-pay vote and a requirement for listed companies to have independent compensation committees. The Act authorized the SEC to issue rules requiring disclosures of the relationship between executive compensation and financial performance as well as rules requiring companies to disclose the annual total compensation of the chief executive officer (CEO), the median annual total compensation of all employees, except the CEO, and the ratio of the median employee annual total compensation to that of the CEO. Under the Act, the SEC is required to direct-listing exchanges to enforce the implementation of policies relating to clawbacks of compensation packages and disclosure of incentive-based compensation that is based on publicly reported financial information. The trigger for a clawback is a financial reporting restatement.

The Act reforms deposit insurance. The Federal Deposit Insurance Corporation (FDIC) is required to base deposit insurance assessments on the average consolidated total assets minus average tangible equity of insured depository institutions. The Act revises the assessment calculations and shifts the distribution of assessments to the larger banks. The Act permanently increases the maximum deposit insurance amount to $250,000. The increase has retroactive effect for institutions for which the FDIC was appointed receiver or conservator between January 1, 2008 and October 3, 2008.

The Act amends the regulation of bank and thrift-holding companies and depository institutions. The Act requires increased supervision and stricter regulation pertaining to the examination and enforcement powers over depository institution-holding companies and their subsidiaries. However, holding companies of thrifts that function solely in a trust or fiduciary capacity are excluded under the Act.

The Act increases restrictions on loans to company insiders. The insider loan restrictions are heightened in the Act via an expansion of the types of transactions subject to insider lending limits. Such transaction types include securities lending or borrowing transactions, repurchase agreements and reverse repurchase agreements, as well as derivative transactions.

To reduce the risks of contagion among markets and financial firms, the Act also includes provisions on payment, clearing, and settlement. Because financial firms that conduct or support multilateral payments, clearing, or settlement functions can create and concentrate risks to the financial system, the Act includes greater oversight of these entities and their respective activities. Accordingly, the Act designates systemically important financial market utilities as well as payment, clearing and settlement activities.

The Act established the Consumer Financial Protection Bureau (CFPB). The CFPB combines broad powers with a significant budget and exercises most of its consumer protection functions under existing consumer protection laws. While providing certain exemptions, the Act defines covered person rather broadly by including any person engaged in offering or providing a consumer financial product or service.

Most important for this summary, the Act required registration of advisers to certain private funds in Title IV. Prior to the enactment of the Dodd-Frank Act, private fund advisers and promoters designed private funds to operate within the exceptions and exemptions of the Securities Act of 1933, the Securities Exchange Act of 1934, the Investment Company Act of 1940, and, until 2012, the Investment Advisers Act of 1940. For the pre-Dodd-Frank law on advisers, *see* Investment Advisers Act of 1940, Pub. L. No. 76–768, 54 Stat. 789 (current version at 15 U.S.C. § 80b (2012)). These exemptions gave private fund advisers substantial freedom in their investment activities.

Title IV of the Dodd-Frank Act authorized the SEC to promulgate rules requiring registration and enhanced disclosure for private fund advisers (Dodd-Frank Act, Pub. L. No. 111–203, § 401, 124 Stat. 1376, 1570 (2010)). Title IV requires private fund advisers with more than $150 million assets under management (AUM) to register with the SEC as investment advisers. In addition to exempting private fund advisers with less than $150 million AUM from registration, Title IV also exempts advisers with less than $100 million AUM who provide advice to foreign private advisers with fewer than fifteen clients and investors in the United States, advice to clients on investments other than private funds, and venture capital fund advisers.

In addition to mandating private investment fund adviser registration, Title IV requires registered investment advisers to maintain records and any other information that may be necessary and appropriate to evaluate the private fund industry, maintain appropriate oversight, and avoid systemic risk. To attain these objectives, the SEC amended its Form ADV and introduced Form PF (private funds).

The reporting obligations in Form PF increased the level of regulatory oversight of private funds to unprecedented levels. Form PF requires investment managers to disclose information about themselves, about the funds they manage, and about their investors. This includes the products used by the investment adviser, performance and changes in performance of the products, financing information, risk metrics, strategies used, credit exposure, and positions held by the investment adviser, among other categories of information.

Important Form PF disclosure requirements include the five trading counterparties to which the reporting fund has the greatest net counterparty credit exposure, along with the dollar amount owed to each creditor, and a breakdown of the net asset value (NAV) that the investment manager manages, including the percentage of the reporting fund's net asset value that was managed using high-frequency trading strategies. Other important Form PF disclosures include the requirement that the manager identifies changes in market factors and their effect on the long and short components of the portfolio as a percentage of NAV, any information about the counterparties' collateral and other credit support posted to the respective reporting funds, as well as trading and clearing mechanisms subject to liquidity constraints and the duration of those constraints.

The SEC intended Form PF to improve its understanding of reporting funds' liquidity, exposure, and assets. To help the SEC understand reporting funds' liquidity, exposure, and assets, Form PF requires investment advisers to disclose the time increments it would take to liquidate a certain percentage of the reporting funds' portfolio, the dollar value of long and short positions in each asset class, the value of turnover by asset class, the market value of each of the advised funds' borrowings and the types of creditors, and the aggregate value of all derivative positions for each advised fund. Finally, Form PF requires disclosure of the reporting funds' restrictions (if any) on investor withdrawals and redemptions and other information pertaining to investor liquidity, such as the percentage of NAV.

The SEC takes a tiered approach intended to reflect the relative risks of each type of fund. Large hedge fund advisers, those with at least $1.5 billion Regulatory Assets Under Management attributable to hedge funds, are required to update Form PF filings quarterly (*Id*. at 71,140). By contrast, private fund advisers with less than $1.5 billion RAUM attributable to private funds are required to complete and file Form PF annually (*see id*.).

In light of the highly sensitive nature of these required disclosures and the complexity of the reporting requirements, Form PF can create substantial challenges for the hedge fund industry. Some of the most controversial disclosure requirements in Form PF include the reporting of risk metrics, strategies and products used by the investment adviser and its funds, counterparties and credit exposure, performance and changes in performance, financing information, percentage of assets traded using algorithms, and the percentage of fund assets held in equity and debt instruments.

## Conclusion

The Dodd-Frank Act fundamentally reformed the financial services and banking industries in the United States. Significant changes associated with the Dodd-Frank Act are particularly associated with the private fund industry. Despite the tectonic shift in the regulatory framework for the private fund industry, some evidence exist that the private fund industry is coping well with the new post-Dodd-Frank Act regulatory environment.

# Domains of Sustainability

Paul James and Liam Magee
Institute for Culture and Society, Western Sydney University, Penrith, NSW, Australia

## Introduction

One dominant framework sets the terms for almost all thinking today about questions of sustainability. Whether contemporary policy-makers are aware of it or not, this structure is the basis of the way that most practitioners and thinkers across the globe approach sustainability issues. The framework assumes that sustainability should be understood in terms of three domains: the economy, the environment, and the social. These domains are said to relate to each other as three independent spheres of life. They are usually depicted visually as three pillars, as a Venn diagram of three intersecting circles, or as three nested concentric circles with the economy at the center. In each case their combined outcome is one of supposed sustainability.

Today, sustainability is a foundational concept for public administration, policy-making and political governance, and versions of this three-domain framework are everywhere in policy documents. Despite this prevalence, however, the framework is rarely interrogated in either an

intensive or sustained way. By comparison, policy content is regularly examined for its potential impact on sustainability outcomes. Practices of sustainability are routinely evaluated for their consequences. And indicator sets are carefully formulated for assessing sustainability. At the same time, the frame for defining and operationalizing sustainability is usually left as an assumed set of categories: economy, environment (or ecology), and social (or society), with the economy usually striding out in front as the first among "equals." In other words, economic considerations have become the center of almost all decision-making processes, and *the economy* (note the definite article "the" here denoting the singularity of the concept) is treated as central to the human condition, qualifying and providing a measure of comparison for everything else. In the late 1990s, a team of economists even set out to put an economic value on the world's biosphere (Constanza et al. 1987).

When this three-domain structure is modified, there is rarely any reflection on why it is being changed or why the original domain structure is a problem. Hence the modifications usually carry the problems associated with the originating structure. The problems of the dominant three-domain structure vary in their impact and consequence, but a few key summarizing points can be laid out immediately:

1. A particular form of the economic tends to be lifted out as *the* primary orientating limit for sustainability practice. That is, since 1989 and the fall of the Berlin Wall, capitalism as a mode of production from the industrial to post-industrial is usually taken as the only economic regime under consideration. Sustainability practices therefore are limited to the disciplinary task of civilizing a wild and rampant capitalism (Elkington 1997), rather than the more fundamental task of securing a sustainable economic order per se. There are signs, in Brexit, in the US election of Donald Trump, and in the rise of alt-right movements elsewhere, that postindustrial populations are today reacting fiercely against the dominance of global capitalism and are seeking a retreat to national or parochial alternatives. Both, needless to say, have not historically led toward more *sustainable* economies.
2. The economic is itself is usually treated reductively as primarily concerning production and financing, leaving out many other aspects of economic practice such as work and welfare. The one area that has entered into sustainability practice more recently is accounting (Lamberton 2005). However, this has taken the form of accounting *for* sustainability, and it has not led to the inclusion of accounting and regulation as one of the subdomains of economics (as we would argue should happen) – that is, as a subdomain that itself should be assessed (Deegan 2013).
3. The environment is too often defined as outside of human practices, ignoring, for example, the ecology of the human body or the interrelationality of ecological systems, human and nonhuman. This tendency is very apparent in the dominant sustainability ratings for buildings. These rating systems – including most notably Building Research Establishment's Environmental Assessment Method (BREEAM), Sustainable Building Tool (SBTool), and Leadership in Energy and Environmental Design (LEED) – all work as standalone assessments of a building in itself, rather than placing the building in the context of the larger built environment, its ecological setting, and its human use (Castanheira and Braganca 2014). Like the economy, the environment is also frequently understood as a domain that is independent of its social formulation. It is *nature* that stands aside from sociality and must either be utilized by the economy or preserved by and for the society.
4. The social is often relegated to being the vague domain of extra things that do not fit the first two categories. It thus does not have any coherence as a category except to signify the practitioner's interest in more than economic and environmental considerations. This produces an unresolvable paradox: societal matters can be reduced to economic commodities transacted within markets, and at the same time, these matters are defined by their very

exclusion from the economy proper. It is both related negatively and extensionally to the primal category of the economy.

5. Political issues are embedded in the social and/or largely reduced to questions of governance and implementation. Following Point 4 above, it also occupies the social space that is of little interest to markets. Foreshadowing our discussion of Marx and Smith below, the highly politicized conditions of the economy itself are ignored.
6. Cultural issues, except for education and capacity training, and occasionally heritage are too often completely passed over. Again, anticipating our alternative formulation discussed below, we suggest that this passing over ignores the complex and interconnected relations between culture and other political, economic, and ecological practices. Quite aside from questions here of sustaining cultural diversity as an intrinsic aim, interpreting culture as a submerged part of the social forgets that economies themselves – including the global market – are intrinsically also cultural forms, historically developed, but as more or less contingent in their enactment as any other practice. In other words, there is a need for a domain structure which can talk as much about the culture of economics as the economics of culture (and politics and ecology).
7. The three domains are treated as independent spheres of actual activity. For all of the arguments that the three domains need to be brought together in an integrated assessment, they continue to be hypostasized as standalone spheres, pillars, or circles. This is not to suggest that different domains of sustainability should not be given their own integrity with their own means of measurement (and not just financial equivalences). But it does require a way of having it both ways: that is, naming different domains of sustainability in *analytic* terms and recognizing that *in practice* they are dimensions of a whole rather than standalone spheres that need to be brought back together.

Overcoming these problems is the motivating concern of our discussion. It is woven throughout the chapter by implication and through critique. We begin by examining the history of the concept of "sustainability," focusing on the methodology associated with its application to public administration, public policy, and political governance. This will be done in the first instance through a detailed examination of a key classical text, *Our Common Future* (World Commission on Environment Development 1997). The chapter then works to understand the nature of the domain structure that frames thinking on sustainability as it is practiced into the present. Finally, the chapter seeks to describe an alternative framework for understanding domains of sustainability that we argue might avoid some of the present problems.

D

## The Short History of Sustainability

Sustainability is usually defined in terms of being able to carry on, endure, or have a future. This is what can be called *negative sustainability* – not negative in the sense of being bad, but negative in the sense of *just* keeping a system or process going through the absence of harmful action. Reducing pollution. Curbing chronic inequality. Mitigating the excesses of development. Keeping down levels of crime. As we have elaborated elsewhere, negative sustainability describes the process of reducing the bad effects of previous rounds of development or human practice that might qualify our future (James et al. 2015). By comparison, *positive sustainability* can be defined as practices and meanings of human engagement that make for life worlds that project and support ongoing natural and social flourishing. In contrast to negative sustainability, this requires that we define the terms and conditions of what we consider to be positively good. It entails projecting practices for achieving the enduring future of those conditions, a much more demanding prospect. Most troubling in the age in which we live, it requires a thoroughgoing re-acquaintance with our material and social worlds in terms other than as a collection of resources for investment, exploitation, and labor.

One document written 30 years ago, *Our Common Future*, provides a useful point of departure

for beginning that task. The report was the work of the World Commission on Environment Development, established by the United Nations in the mid-1980s. *Our Common Future* is a reference point for almost all thinking today on sustainability. It elaborates a structure for understanding sustainability that has been frequently qualified but remains influential and pervasive since it was first published. Its definition emphasizes our responsibility as a global community to those people who will come after us: "Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs." (World Commission 1987, p. 41).

This definition still works for many purposes and, despite its anthropocentrism, is almost universally regarded today as normatively positive. This is despite the fact that it is presented as a self-disciplining prepositional phrase: as much as sustainability normatively constrains development, development precedes, defines, and disciplines sustainability. Moreover, in the terms of our definition above, this approach retains all the features of a negative definition of sustainability. To be fair, while the report does not actively set out the conditions for positive sustainability, it does elaborate what it means by "needs" in a minimal way – the human need for livelihoods, food, energy, housing, water supply, sanitation, and health care. And, for the first time, it makes the remarkable claim that "Over the course of this century, the relationship between the human world and the planet that sustains it has undergone a profound change" (p. 26). It thus brilliantly anticipates discussions about the Anthropocene that reach their culmination three decades later.

*Our Common Future* was one of the first major public documents to use the three-domain model, though for the most part this use remains implicit. Resounding throughout the document are enveloping sentences such as the following: "No single blueprint of sustainability will be found, as economic and social systems and ecological conditions differ widely among countries. Each nation will have to work out its own concrete policy implications" (p. 39). The appeal to local specificity here is important. The report, however, anticipates many of the problems that are carried through by subsequent policy and governance writings.

First, many of the orienting arguments of the report separate out the economic from the social. It is not done directly. Rather it is assumed while making claims about other issues. In one example concerning the reach of the report, the report's authors say, "Thus the goals of economic *and* social development must be defined in terms of sustainability in all countries – developed or developing, market-oriented or centrally planned." (p. 41 emphasis added). As in numerous other places in the report, the syntax here – the use of the word "and" – assumes that the economic stands outside the social. And additionally, by implication from the context of that sentence, that social development necessarily follows from economic development.

Second, *Our Common Future* elaborates upon its aim of finding an integrated understanding of sustainability by making a self-contradicting and self-defeating theoretical proposition: the environment, the economy and the social are "all one":

> Until recently, the planet was a large world in which human activities and their effects were neatly compartmentalized within nations, within sectors (energy, agriculture, trade), and within broad areas of concern (environment, economics, social). These compartments have begun to dissolve. This applies in particular to the various global 'crises' that have seized public concern, particularly over the past decade. These are not separate crises: an environmental crisis, a development crisis, an energy crisis. They are all one (p. 14).

Despite its laudable attempt at holism in this claim, the problem is that the means of analytical integration remains rhetorical. Because *Our Common Future* regularly uses these terms throughout the report as standalone analytical concepts (our first point above), the work to bring them back together needs to be much more than a few rhetorical flourishes. And it needs to be more precise about its integrating propositions. For example, the report argues that, "We are now forced to accustom ourselves to an accelerating ecological interdependence among nations. Ecology and economy are *becoming* ever more interwoven locally, regionally, nationally, and globally into a seamless net of causes and effects" (p. 14 emphasis added). However, what this suggests is

that these domains of ecology and economy were once separate – not just as ideas, but in practice – and recent processes of globalization have brought them together. As we will explore below, it turns out that except for one aspect – that is, intensifying processes of globalization have certainly intensified the *global* interrelationship between these domains – the claim is historically and practically wrong. In practice, ecologies, economies, and social relations have *always* been bound up with each other. Even in theory, they have long been integrated. In the Western tradition – to take an example where their dissociation might appear most credible – physiocrats have long argued for the integral relationship between land, nature, and the production of wealth. Even nineteenth-century thinkers, like Adam Smith and Karl Marx, who had begun to argue for the importance of economic relations also stressed their close relationship to political and ideological forms. To make things more perplexing, in the world of ideas, it is only during the period which the report was being written – the mid-to-late twentieth century – that these three domains were just being separated out (having simultaneously just been put together). This double move is a confusion to which *Our Common Future* centrally contributes.

Third, *Our Common Future* assumes a certain kind of economics – one of necessary growth. "Meeting essential needs requires," the authors contend, "not only a new era of economic growth for nations in which the majority are poor, but an assurance that those poor get their fair share of the resources required to sustain that growth" (p. 16). It is the words "not only" here that signal our point, but the authors go much further. In fact they argue for a whole new era of economic growth. They estimate "a five-to-tenfold increase in manufacturing output will be needed just to raise developing world consumption of manufactured goods to industrialized world levels by the time population growth rates level off next century" (p. 21). Aside from implicitly endorsing the idea of "industrialized world levels" constituting a comprehensive and homogenous set of goods that the "developing world" ought, in toto, to pursue, they ignore the many discontents that had by 1987 already long existed precisely due to the very processes of industrialization. Though recent arguments about the existence and desirability of "multiple modernities" might overstate the case, it is clear that paths toward modernization are themselves complex and may involve very different configurations and corresponding quantities of "manufacturing output" to meet the needs of the world.

Fourth, *Our Common Future* treats "species and ecosystems as resources for development" (p. 20). This phrase is the title of Chapter 6. It anticipates the language of ecosystem services, which turns ecological processes and beings into resources that serve the economy. To be sure, the more sophisticated and normatively oriented ecological economists treats the environment as both a means and ends. However, such sophistication continually risks becoming erased when translated to institutional practice, where "bottom-line" accounting cannot help but to reinterpret the environment as a bundle of costs and benefits that input into sustainability statements. As Andy Scerri writes:

> the three-dimensional model tends to coalesce social and economic drivers and, in the case of TBL [Triple Bottom Line] and CSR [Corporate Social Responsibility] 'reporting', for example, subsumes these to pre-determined market-economic efficiency criteria that are adjusted to provide for environmental protection or social justice concerns. (Scerri 2012, p. 3)

For private firms, such risks are especially acute. While it is rare for firms to go broke as a direct consequence of their environment record, legal, political, and other social bottom lines really still resolve to a single bottom line: profit. Public policy approaches to ecological modernization – a term that emerged in the late 1980s at the same time as *Our Common Future* – followed the same pathway. As Peter Christoff puts it:

> the environment is reduced to a series of concerns about resource inputs, waste and pollutant emissions. As cultural needs and non-anthropocentric values (such as are reflected in the Western interest in the preservation of wilderness) cannot be reduced to monetary terms, they tend to be marginalised or excluded from consideration. (Christoff 1996, p. 485.

Fifth, *Our Common Future* draws political concerns into the economy-ecology intersection

without giving politics any separate integrity as a dimension of the social. To take an example that appeared anachronistic in the 1990s and 2000s but which now threatens to emerge once more, the nuclear arms race is drawn into the economy-ecology dyad by emphasizing that its use of economic resources could be otherwise used for economic development. The actual deployment of those resources – nuclear war – is decried for its disastrous ecological circumstances rather than its comprehensive annihilation of life as we know it. The political dimension of these social disasters disappears in the narrative of the crises that the world faces. All sorts of localized variations, from the effects of climate change on Pacific Island peoples to the imbalanced distribution of environmental harms and benefits in urban planning, are similarly obscured by the assumption that economic and environmental goods can be dispassionately evaluated and transacted.

In analyzing a 30-year-old document, it is neither our intention to ignore the monumental shifts in policy and planning discourse that its publication has occasioned nor to undermine its drive toward a recalibrated estimate of the goods and harms processes of modernization, industrialization, and economic development have brought. We have discussed what we, and others, see as its failings at length precisely because *Our Common Future* remains such an influential touchstone for contemporary developments in public policy, administration, and governance. Before we survey some of the current frameworks that bear this influence, we need first to go back a little further into history to explore how, in conceptual understanding, the domains of environment and economics emerged variably. This emergence is much more recent than one would imagine.

## The Longer History of Domains of Sustainability

Sustainability as a concept that applies to the domains of ecology, economics, politics, and culture – or even as applied one of those domains taken separately – is remarkably recent. Even the linking of sustainability with the environment is more novel than one would expect. In 1962 Rachael Carson wrote her bestseller *Silent Spring* (1962). It began a national debate in the United States with extended global impact leading to the banning of DDT. She introduced the paradigm-changing idea of the "ecology of the world within our bodies." However, the book never used the concept of "sustainability." A decade later in 1972, a dispassionately ferocious book called *Limits to Growth* hit the bookstands and despite its reliance upon what was for the time complex computational models, sold 12 million copies. Though deeply concerned about the ecological future of the planet, yet it too never used the word "sustainability" (Meadows et al. 1972). Treating the economy and the environment as domains has a longer history, but it is not as extended as one would have assumed.

### The Domain of the Environment

When Gro Harlem Brundtland took on the task of chairing the World Commission on Environment Development, she was wrestling with the question of domains:

> When the terms of reference of our Commission were originally being discussed in 1982, there were those who wanted its considerations to be limited to 'environmental issues' only. This would have been a grave mistake. The environment does not exist as a sphere separate from human actions, ambitions, and needs, and attempts to defend it in isolation from human concerns have given the very word 'environment' a connotation of naivety in some political circles. (From the Chairman's Forward 1987, pp. 6–7)

As significant as Brundtland's reference to the integration of the environment with "human concerns" might be, this recognition dates from much earlier. While "the environment" only enters common English usage in the twentieth century, in the notion of *nature* that usage is often (though not universally) synonymous with one of the conceptual anchors of Western philosophy and religion. And while analytic distinctions between nature and its various opposites – society, artifice, civilization, God, idealism, and so on – abound within that tradition, these distinctions point equally toward the practical intermingling of human and

natural concerns. Humans till and tender the earth, even as they are subject to its ferocious forces. They enjoy its bounties just as, through sin, technology, or the exercise of will, they alienate themselves from its encompassment.

It might seem, through its near synonym of nature, that the environment is a universal domain. Industrialization marks the transition, however, in practice *and* in recognition, of the relations between humans and nature. Still subject to its demands, humans increasingly exercise control upon it – part of a broader transition that Foucault (2008) describes as *biopower* or *biopolitics*, the regulation of populations through, among other techniques, organized interventions in practices of agriculture, health, and sexual reproduction. As Leo Marx recounts in *Machine in the Garden* (1964), the nineteenth century witnessed an increasing distress among American literary writers about the arrival of machinery: trains interrupting the serenity of the countryside in Hawthorne's "Sleepy Hollow," shipping disturbing the natural order among oceanic species in Melville's *Moby Dick*, and steamboats wreaking violence upon nonmechanical boats on the Mississippi in Twain's *Huckleberry Finn*.

Simultaneously, the founders of sociology searched for terms that could encompass the diversity of nature that support forms of organic life and yet which could be shed of humanistic, animistic, or metaphysical overtones. Borrowing from the emerging systemic language of biology, in *System of Positive Polity* (Comte 1875) Augustus Comte picked upon the term of "environment" to do this work. Echoing in many respects the sentiments of cyberneticians and system theorists – themselves major influences, as we have discussed in relation to the *Limits of Growth*, upon formulations of sustainability – Comte's "Environment" is what surrounds what he terms the "Organism.' This "Organism" is animate, but can be collective: describing vegetative, animal, human, and also social entities such as the family, the country, and, indeed, society as such. The environment is, here, a nature that is external to but which is also subject to modification by and is therefore of *concern* to the organism: "In the first place every living being, though it be limited to a mere vegetative existence, is constantly modifying the environment on which it depends, through the substance which it consumes, and the products which it gives off" (p. 34). Comte lays down no hard limits on where this concern might end, even imagining the modification of the "astronomical condition of the earth," but instead warns pragmatically against extending the "environment" to again encompass all of nature – perhaps too eager, in hindsight, to constrain the human environment he continues: "For these vast changes in the solar system have not the slightest bearing upon our real future" (p. 36).

Comte's warning anticipates our own attempt in the final section of the present essay to distinguish the concept of "ecology" (constrained) from that of "environment" (infinitely extended). In our terms the ecological domain is defined as the practices, discourses, and material expressions that occur across the intersection between the social and the natural realms, including the important dimension of human engagement with and within nature, ranging from the built environment to the "wilderness." This is a far more constrained definition than that of an ever-expanding (and largely unknowable) environment coextensive with the universe of all beings, things, and processes. This means that we both recognize the contradictory place of humans in ecology – biologically constituted and socially abstracted – and we acknowledge the fact that the environment or a natural world that extends far beyond the human.

Comte's definitional work itself registers a profound shift, reorienting ends to encompass "human concerns" for the environment. In his treatment of the environment as a *modifiable* and therefore non-isolatable nature, he acutely anticipates the Brundtland report's (unresolved) injunction to consider it an analytically distinct but practically enmeshed domain. If, in being oriented toward system maintenance rather than perfectibility, current theories and policies of "sustainability" seem as much humbled future-oriented visions of Comtean "Progress," nonetheless they continue to adhere closely to this comparatively recent conceptual turn. Such treatments of

the environment do however find much greater difficulties with its relationship to economic activity.

### The Domain of Economics

The history of the concept of "the economy," where "economy" takes on a definite article as a domain of practice is, too, surprisingly recent. But, important to our critique of the use of the economy as the master domain, it is actually much more contemporary than that of the environment. The concept of "the economy" was really only lifted out into the broad setting of social relations in the early twentieth century, and it was not used with any regularity until as late as the 1940s (use of an n-gram search for the phrase "the economy" reveals almost no examples of the economy as a domain of social life prior to the 1940s: https://books.google.com/ngrams). This point is worth dwelling upon. The concept of "the economy" was only *beginning* to be used with any regularity within lifetimes of people still living today. This realization cuts through any sense of the naturalness of the common contemporary refrain that "it is the economy, stupid."

The writings of Adam Smith, John Hobson, and Karl Marx are no exception. Writing in the eighteenth century, Adam Smith, the father of modern economics, did not use this lexical form at all. Because economic commentators today rarely grapple with his original passions – and because economic history has largely been subsumed into business studies – they fail to recognize that books such as the *Wealth of Nations* (Smith 1776) use very different concepts from "*the* economy." When Smith does use the term "economy," it is rarely with the definite article and never as a domain. Rather, "economy" is always normatively paired as "good economy," in the sense of being economical, frugal, and careful in management, or it is methodologically paired as "political economy" – referring to the science of the systems of commerce and agriculture, as Karl Marx would go on to use the term in a far more cynical vein. For Smith, the addition of "political" to "economy" is what elevates the economic from the habits and predisposition of individuals (of, e.g., "the rich" or "private people") to a system that impacts and is effected by nation-states.

In the transition of the eighteenth century into the nineteenth, the slowly emerging domain of economic practices began to take over the power of sovereigns to set the truth-value of an idea or imaginary. This is what Michel Foucault (2008) describes as a "regime of veridiction." However, this uneven process of abstracting economic practices as a separate domain of activity did not really take hold until the twentieth century. One of the pioneers of computing, Charles Babbage, was able without awkwardness to call his account of the industrial technologies of the time *On the Economy of Machines and Manufactures* (1832), by which he meant principally the physical efficiencies and affordances of mechanical engines – and only secondarily, how these benefits might improve rates of profit. His use of "the economy" owes more to Isaac Newton and James Watt than Adam Smith. John Hobson (1902), writing at the end of the nineteenth century, similarly deploys the phrase "the economy of" in Smith's first sense of the economic nature of a process. Hobson occasionally begins to use the term "economy" a little more abstractly, just as Marx did writing a little before him – for example, in the phrase "the economy of large-scale production." Hobson and Marx, also similar to Smith, tend to use concepts such as "political economy" to name methods and discourses.

It was Marx's writing that signals the beginning of a shift that took more than half a century to be realized. Marx himself never uses the concept of "*the* economy" (*die wirtschaft*) with the definite article to mean a separate domain of practice. He begins instead to use the concept of "economy" in metonymic terms to describe a ruling value system, just as one might use the concept of "the crown" to refer to a monarch, for example, "How long is it since economy discarded the physiocratic illusion, that rents grow out of the soil and not out of society?" (Marx 1867, p. 95). In other words, he gives *the economy* a metaphorically abstracted life as an order of power in order to drag it down to earth. How ironical it is then that the concept of "the economy," once either not available for easy use or used against itself, now

casts such a shadow over the contemporary human condition?

## The Dominant Domain Structure in the Twenty-First Century

If we examine the different policy discourses associated with prominent international organizations, we find the same three-domain structure of sustainability, with "the social" acting as a convenient term to gather up those dimensions of life that belong neither to the economy nor the environment. In this section we survey briefly three global major initiatives that have emerged since *Our Common Future*. Each of these have had consequence for policy, administration, and governance, in many cases becoming directly translated into national and local legislation, organizational structures, funding allocations, reporting practices, and dialogue with constituents.

### Triple Bottom Line

The *Triple Bottom Line* is a conspicuous object of our criticism here, but its emergence and popularization through the work of John Elkington was significant in translating *Our Common Future* to concepts of sustainability with which private industry in particular could acknowledge and work. The framework's development arises in response to a range of earlier efforts to account for negative externalities: that is, by-products or costs that are not reflected in the market price of products and services. These costs are not borne by either parties to a transaction, but by some third party. Such externalities can be social, environmental, or both. For example, pollution generated through the extraction, manufacture, transport, consumption, and disposal of raw and manufactured materials is one obvious environmental externality. Only recently, with the introduction of environmental regulations, emissions-trading schemes, and standards for measuring the material impacts of production cycles, have certain externalities begun to be internalized within the auditing procedures and pricing structures of firms. Within the economics literature, not all externalities are negative. Some are positive, such as the benefits that accrue to existing participants in an information network like the Internet as new consumers purchase connectivity contracts from service providers.

Overwhelmingly, it is the negative externalities that are the focus of discussions of sustainability. The *Triple Bottom Line* defines these externalities under two groupings of third parties: social and environmental. These underpin an important distinction between, respectively, human and non-human actors. At least in its early developments, both these sets of actors are passive recipients of the effects of transactions between firms and their suppliers or customers. More recent developments have begun to acknowledge that social and environmental actors kick back. Recognizing that the malevolent consequences of unfettered markets can lead to consumer boycotts, lawsuits, protests, and reputational damages, amplified in an age of social media, has led, for example, to estimations regarding the social bottom line causing adjusted forecasts for economic returns. Short-term profit is sometimes subsequently sacrificed to preserve social "good will" toward a firm. Similarly, environmental damage to crops and land can reduce long-term yields for agricultural producers and many others involved in primary resource cultivation and extraction.

As we acknowledge below, these calculations have benefits to the actors affected by corporate activity. However, they at best ameliorate the impacts of externalities, precisely by continuing to imagine these impacts under rubrics of costs/benefits that cannot help but to translate them into an underlying "base" economic language and logic. Where private corporations' geographically local entities that were continuously responsible and responsive to state, community, and other social authorities, where other logics are at play, Triple Bottom Line accounting practices might even have binding force. In an era of globalized markets and firms, where disciplined regulatory environments can be sidestepped by relocation, subcontracting, or other mechanisms, instead too often they function more as white- and green-washing tactics.

### Millennium Development Goals

Following the Millennium Summit of the United Nations in 2000, all 189 member states resolved to respond to what became called the Millennium Development Goals. The MDGs grew out of the United Nations *Millennium Declaration* (2000), a document built around the principles of freedom, equality, solidarity, tolerance, respect for nature, and shared responsibility. A year later the UN secretary general set out a *Road Map towards the Implementation of the United Nations Millennium Declaration* (2001). It was organized into the following broad domains of activity: (1) peace, security, and disarmament; (2) development and poverty eradication; (3) protecting our common environment; (4) human rights, democracy, and good governance; and (5) protecting the vulnerable. A demanding set of tasks was established, understood as crosscutting. However, in translating these principles and policy directives into practice something got lost. Economics as the supposedly primary domain of sustainable development took over. The eight development goals included eradication of extreme poverty and hunger, achieving universal primary education, and ensuring environmental sustainability, but these came to be understood in terms of statistical targets directed toward a certain kind of development. Not only did the economy became the dominant framing domain but this domain was understood in terms of a pivotal variable – economic growth – to which other practices contributed. In Heloise Weber's words:

> dominant explanations and understandings of poverty and hunger, social struggles for fundamental entitlements, and ultimately 'development', are construed in ways that are premised on abstractions from actual social and political relations; they are framed as 'independent variables' external to the very policies and strategies of international development. (p. 660).

### Global Reporting Initiative

The Global Reporting Initiative (GRI) is a more recent attempt to bind the evocative rhetoric of the *Triple Bottom Line* into global standards for public as well as private organizations. Like the MDGs, it developed from an arm of the UN, the United Nations Environment Programme (UNEP). More than either the *Triple Bottom Line* or the MDGs, it is an attempt to give concrete guidance to organizations on how to account for and report on economic, social, and environment impacts and encompasses within that guidance treatment of internal and external stakeholders alongside a long list of 2,600 concepts and indicators (www.globalreporting.org/standards). To these three domains, inherited also from the *Triple Bottom Line*, the GRI has added the fourth "pillar" of governance. This in part acknowledges the broadening of sustainability assessment from private to public organizations as well and also acknowledges its significance within corporate management.

However, as recent criticism has pointed out, for the all the specificity of the GRI, it retains an essential ambiguity about what constitutes the "sustainability context" under which reporting takes place. Commenting on the latest GRI standard, the G4, the Center for Sustainable Organizations has claimed this absence "will do nothing but help fill the world with yet another generation of so-called sustainability reports, which although compliant with GRI, amount to nothing of the kind" (www.greenbiz.com/blog/2013/05/22/has-gri-consigned-itself-irrelevance).

While noting, again, the significant work of the GRI in establishing foundational standards for sustainability report and in widening the auspices of those standards to encompass public institutions alongside questions of governance, these criticisms echo those made of other frameworks. Compliance with the GRI, and the selection and application of indicators within its guidelines, is both voluntary and subject to costly auditing procedures that are only undertaken, ultimately, for economic or, in the case of public organizations, often political ends. Like accounting standards, indicators can be applied to the spatial and temporal contexts that best suit an organization's interests. Worse, unlike fiscal accounting standards, social, environmental, and governance accounting lack a common currency for expressing their "profits" and "losses." How, for instance, would an external stakeholder in global corporate firms like Google or Twitter evaluate the

relative losses of the impacts of increased rents on the poor on the streets of San Francisco because they have corporate offices in that city? How would BP cost the long-term damage to avian and marine life in the Gulf of Mexico after the Deepwater Horizon oil spill? And at a certain point, the very idea of external stakeholders descends into meaninglessness. We are all affected, in the present and in the future, in a myriad of both evident and nonevident ways, by the activities of the truly global firm. Just as with the *Triple Bottom Line*, adherence to GRI reporting guidelines does little to convince those outside the globalizing firm that these entities do much to stray beyond the strict pecuniary interests of its financial shareholders, directors, and executives.

Within this dominance of the *Triple Bottom Line* framework, there have been attempts to reconfigure the three-domain structure by judicious redefining of terms. For example, in one exchange outlined in an essay called "Rethinking the Concept of Sustainability," its authors challenge the three pillars framework suggesting that domain is a better metaphor than pillars (and indeed it is because of the static architectonic meaning of pillars):

> Let us briefly elaborate on what is meant by each of these domains, beginning with the 'environment'. By 'environment' we are not referring simply to an 'external ecosystem', but an experienced ecosystem with which we as persons have a conscious and deliberate relationship. The experienced environment is the complex ecosystem which has at its center conscious human life. It is not simply a planet cloaked in gases; it is one in which air quality can be assessed as good or bad. Society consists in the complex web of relations that together constitute our personal and collective lives, which may include a variety of characteristics such as parents, football fans, or members of a political party. The economy refers to all those relationships in which there is an exchange of goods and services usually through the financial system, but it may also be through alternative means, such as barter (Banon Gomes et al., 2011, p. 180).

This definition of the environment recalls the Comtean warning discussed earlier, but instead of suggesting, as we would, decentring humans as inherently, contradictory, both constituted by a complex ecology *and* lifted out of it by self-projection, it problematically centers "conscious human life" as *the* basis of assessing the environmental value. Then, to compound the conceptual problems in this alternative, society is defined as the "complex web of relations" that does not encompass those relationships in which there is an exchange of goods of services. Again the economy stands alone.

D

## Alternative Domain Structures, 1

Against the Triple Bottom Line orientation of most domain systems, there have been a series of attempts to formulate a more adequate framework for understanding sustainability. Usually they take the form of eschewing a domain structure altogether. Here we include the Sustainable Development Goals and the New Urban Agenda.

### Sustainable Development Goals

The Sustainable Development Goals of the United Nations are built around a 17-goal structure that appears to get away from the Triple Bottom Line. However, when examined in detail, this is actually not the case. The framing sensibility remains substantially continuous with the problems of the millennium goals discussed above.

As can be seen in Fig. 1, the Sustainable Development Goals are oriented toward ecological considerations. Nevertheless, the tagline of the agenda for Sustainable Development Goals reveals its continuing overriding emphasis on economics – for example, the United Nations presents its over-bracing rationale as "to end poverty [economics], protect the planet [ecology] and ensure prosperity for all [economics]." It thus continues to define sustainable development, much like *Our Common Future*, in terms of economic outcomes. Of the 17 Sustainable Development Goals, the only relatively unambiguous cultural goal is Goal 4: "Ensure inclusive and quality education for all and promote lifelong learning," and even this goal is characterized by educational technicalities that could be said to be learning for modern *economic* development, much like the Millennium Development Goals.

Goal 5, "achieve gender equality," can also be located in the cultural domain (as we have done in Fig. 1), but read in the context of what the United Nations means by "equality"; it would be equally fitting to locate gender equality either in the political (as involvement in governance) or in the economic domain (as pay equity), rather than the cultural.

More recently, the United Nations appears to have gone in two directions at once. Firstly, its City Prosperity Index reverses the usual process of setting out the domains of sustainable development within which other processes are organized. Instead, it begins with the question of prosperity and sets up a set of independent domains: (1) productivity, (2) infrastructure, (3) quality of life, (4) equity and inclusion, (5) environmental sustainability, and (6) governance and legislation. This is fine as an intrinsically organized set of domains. They could all be argued for as necessary conditions for prosperity. However, by starting from the specific problematic – prosperity – it makes it difficult to map the process against the Sustainable Development Goals, which were set as the overriding policy priority for the United Nations. It also makes it almost impossible to map against the second development, which is intended to provide operational guidance for cities in acting sustainably, namely, the New Urban Agenda.

This second direction was marked by the 2016 Quito Habitat III summit, when UN-Habitat proclaimed the New Urban Agenda as its basis for framing the next 20 years of policy and practice. This 22-page document is not organized structurally at all. It is a manifesto for sustainability that appears, like the Sustainable Development Goals, to eschew domains (Habitat III 2016), at least as textually structuring devices. Laudably, the New Urban Agenda acknowledges the importance of culture and cultural diversity. In fact it seems to acknowledge the importance of everything. However, after reading the hundreds of lines of variable commitments, it is still possible to find at the heart of the document, like *Our Common Future*, a clause that sets out its approach to sustainable development in terms of a three-domain structure that continues to insist upon the separation of the economic from the social and environmental:

> To fully harness the potential of sustainable urban development, we make the following transformative commitments through an urban paradigm shift

**Domains of Sustainability, Fig. 1.** Using the circles framework (discussed below) to map the Sustainable development goals

> grounded in the integrated and indivisible dimensions of sustainable development: social, economic and environmental. (p. 6)

Notwithstanding the welcome inclusion of the social as the first term, it does not come as a surprise that the "virtuous" concept of "sustainable economic growth" or its equivalent is used at least a dozen times through the brief document.

### Four Streams of Integrated Sustainability

Even fields of activity that are overtly cultural in their emphasis struggle with developing adequate domain structures. The American Institute of Graphic Arts, formed in 1914 and now known by its acronym as AIGA, the professional association for design, works with a method framed by "four streams of integrated sustainability": (1) *environment*, "actions and issues that affect natural systems"; (2) *people*, "actions and issues that affect all aspects of society"; (3) *economy*, "actions and issues that affect how people and organizations meet their basic needs, evolve and define economic success and growth"; and (4) *culture*, "actions and issues that affect how communities manifest identity, preserve and cultivate traditions, and develop belief systems and commonly accepted values" (AIGA 2016). This approach was launched in 2009 and is still active with a scorecard for practitioners and advice for the policy-makers who want to use it.

As first sight it works well, and the principles that are structured into the four-domain structure are an inspiring departure from the usual Triple Bottom Line structure. The definition and description of these four domains has the virtue of giving cultural questions an internally generating integrity that does not depend upon being translated into or legitimated by economic return. However, two problems arise here. First, the category of "people" (which acts like the Triple Bottom Line domain "the social") should by definition include both "economy" and "culture." These are "both actions and issues that affect all aspects of society" – the very definition of the domain called "people." Hence it begs the question: why is economics not an activity in which people engage? Second, the category of "economy" assumes growth as a basic part of its definition. The domain structure was adapted from Adam Werbach's *Strategy for Sustainability: A Business Manifesto* (Werbach 2009), which has the same problems. Echoing Gro Harlem Brundtland from 1987, Werbach writes: "Focusing solely on saving the environment did not suffice – did not save lives, livelihoods or neighbourhoods." Thus, he said, we "needed to fight for a larger kind of sustainability: one that took into account our social, economic and cultural sustainability, as well as our ecological surroundings" (Werbach 2009, p. 3). Unfortunately, for all of the good principles espoused by the "four streams of integrated sustainability" approach, this is one of those apparent breaks from "business as usual" which does not actually break with the problems of the Triple Bottom Line. This time, the problem comes from reducing the domain of economics to questions of profitability. Similarly, for Werbach, the economic means "operating profitably" while supplying basic goods for people (Werbach 2009, p. 9). Economics does of course have profitability as a bottom line, but that does not mean that the domain of economics itself can be defined in terms of such a narrow parameter. Such a move leaves out subdomains highlighted by the *circles of sustainability* such as labor and welfare, wealth, and distribution (see Fig. 2)

## Alternative Domain Structures, 2. Circles of Sustainability

The *circles of sustainability* approach, one that we have been involved with a number of others in developing (www.circlesofsustainability.org), seeks to address what we have here criticized in other frameworks. We acknowledge the important contributions of the *Triple Bottom Line* and subsequent efforts in shifting debates from a myopic focus on economic development and productivity or from an equally self-defeating binary of the economy and the environment. Considering three or four domains implicitly asks, in itself, for a more considered and sophisticated response. However, this does not mean that positing three or four domains as opposed to two necessarily solves any problems. United cities and local

governments have begun to work with a four-domain structure that treats "culture as the fourth pillar of sustainability" (Hawkes 2001), but it leaves unquestioned all the problems that we have already identified. This also accords with our previous discussion of the tendency for apparently dissenting or alternative frameworks to collapse back upon dominant understandings of the economy, leaving undisturbed the underlying assumptions about economic structures that, continuously as well as periodically, reproduce crises of sustainability.

*Circles of sustainability* (see Fig. 2) adopts the now-familiar use of domains represented by a circle divided by four quadrants that reflect each of our four domains. The approach employs the circular form to maximize visual and conceptual recognition for practitioners and researchers in the sustainability field. At the same time, it has taken a more radical approach to understanding how these domains are relational. The most significant step is that the "social" is entirely omitted from the diagram. The social is not treated as a distinct domain, but instead it is understood as the wider field in which different domains of social activity are deployed. In turn, the four domains themselves – economy, ecology, politics, and culture – are not the dimensions of some abstracted concept called "sustainability." Instead they are the segments that we consider most relevant for how we adjudicate our collective efforts to produce more sustainable societies and social life.

This orientation toward sustainability continues an *epistemological* tradition and interest in the ways our knowledge of the social is inseparable from our very embeddedness within social conditions, histories, and systems. To take a deceptively simple example, consensus about environmental "goods" is heavily influenced in Western societies by the modern Judeo-Christian and Romantic privileging of organized and ordered greenery, lushness, and abundance. Both rampant untended growth and barren or polluted wilderness offend this normative ideal. The situatedness of this ideal within a historically influenced social context in no way deflates its power or validity. Indeed, there is no outside the social from which we could derive alternatives. Equally, paradoxically and ironically, our sociality also houses traditions of critique and self-reflexivity that cause us to continually test and manipulate the bounds of the sociality that history has delivered us. Hence, in our own definition of social sustainability, we acknowledge the social determinedness of economic, ecological, political, and cultural practices while also understanding these practices as amenable to redirection.

The same orientation also predisposes the *circles* method to consider the social as the *ontological* ground (here, to be precise, "the social" itself is treated as always in tension with "the natural" as the infinite extension of time/space that carries far beyond human social engagement, including beyond what we are calling the "domain of ecology." Hence we are more comprehensively pointing to a contradictory social/natural grounding, depicted in Fig. 2 through the opening out to a non-bounded space – the infinite natural. Anthropologists talk of the culture/nature contradiction, and this partakes of that conceptual thinking, but it is treated much more broadly) from which other practices, grouped by domains, are analytically derived *and* are given meaning. More than its epistemological considerations, this ground needs to be treated as significant for how we address what are explicitly problematized in earlier models of sustainability. It makes no sense to discuss tensions, for instance, between the economic and the social (as such). The economy is always already social. The economy, dominant though it has become in late modernity, is just one of the ways that social beings enact their sociality. It cannot come into tension with the social, since it is a kind and a form of social life. It can, of course, come into conflict with other forms or practices of social life, and in our interpretation, this is one of ways that the social becomes unsustainability – that is, when certain of its practices curtail the possibility of other practices, or indeed, in apocalyptic scenarios such as nuclear winter, of any meaningful social life at all.

This is an important reorientation. It circumvents, for the reasons just discussed, what we consider to be the category error and ontological emptiness of the *Triple Bottom Line*. If the social,

**Domains of Sustainability, Fig. 2.** Circles of sustainability domain and subdomain structure

the economy, and the environment are all domains that are either independent (as its original casting suggests) or perhaps stand in some configuration of dependency (as some corrections to that original casting have tried to argue), then what is the thing that we seek to sustain? Indeed, one of the difficulties with sustainability debates has precisely been the nominalization of what should always be understood in other grammatical as well as practical terms: to sustain, to live sustainably, to create sustainable social conditions, and so on. One merit of the circles approach is to be

unequivocal here: we wish to argue for and to put into practice a sustainable world, layered across various extensions of *social* relations from the local to the global.

Beyond this analytical point, the division into four domains also permits a more flexible articulation of social practices and relations. By "economy" we do not mean simply, as Werbach argues, a system that invests capital and employs labor to produce products and services that generate profit for a limited pool of shareholders. We intend, rather, the broad variety of "practices, discourses, and material expressions" that encompass both capitalism and other forms of "production, use, and management of resources" (James et al. 2015, p. 53). These include barter, gift-giving, gathering, time-sharing, public industries, and distribution of commonly held property. As we have shown at greater length elsewhere (James et al. 2015), similar definitional generosity can be extended to the other domains of ecology, politics, and culture. In the same work, we have also shown how these domains can be meaningfully decomposed into groups of seven subdomains, and that each of these can act as ways for grouping together and relating systems of indicators, including those put forward by the MDG, GRI, and other global indicator standards. We also argue for crosscutting or intersecting themes that work across domains and subdomains, creating transverse connections and relations between what are both discrete and heavily interrelated spheres of activity. Not only necessary to avoid treating social theory as a mere classification exercise, these thematic layers help to coordinate translation of theory into the messy worlds of practice, where what separates culture from ecology or politics from economy is frequently far from clear-cut.

The purpose of this expansiveness is not to make more complex or esoteric the already diverse field and set of practices that have comprised discussions of sustainability since the seminal Brundtland definition nearly 30 years ago. These discussions continue to unfold at levels that span from the global – including forums like the recent Habitat III – to the intensely local, within urban and rural groups that assemble in community centers, street corners, and living rooms. They cannot be merely elaborated within corporate boardrooms, where directors and executives are persuaded, reluctantly and intermittently, to extend their firms' agendas from financial results to social and environment impacts. Aside from the usual criticisms of corporate social responsibility (CSR), this draws us back to a reductive and blinkered understanding of the economy itself: a sphere occupied paradigmatically by the transnational, highly profitable and low-taxed corporation. At the same time, our approach does not hide from the necessity of economic relations. On the contrary, we argue that a sustainable global society depends critically upon reprising old and discovering new ways of marshalling materials, technologies, and labor – that is to say, one of our most urgent tasks is that of innovating and experimenting on the very form, organization, and operation of the economy.

In emphasizing the limits of how other sustainability frameworks have treated the economic domain, we may seem here to repeat the mistakes of those we are criticizing. We certainly do think similar reconsiderations of ecology, politics, and culture are just as urgently needed and have gone some way toward these reconsiderations in our work (James et al. 2015; Magee 2016). However, it is precisely because of how the current global economic system has been, in our view, so systematically misunderstood by both its adherents and critics in the sustainability literature that we have expended some time here in arguing for a more calibrated and differentiated outlook – one that reassembles the economy into a more equilateral set of relations with these other domains at the same time as it fans out an articulation of what the economic comprises. This double step, conceptual but linked to an intimate sociological and anthropological understanding of the complexities of practice, is equally crucial to the development of policies directed toward more sustainable futures.

## Conclusion: The Role of Domains in Policy and Practice

Taking *Our Common Future* (1987) as the pivot, we have sought here to revisit older and more

recent efforts to define and compile what we term "domains" of sustainability. We acknowledge the risk from a practical standpoint that conceptual genealogies can seem a limited, standing in the way of answering the all-important question facing the seven billion inhabitants of the earth today: "What is to be done?" Neither the slow-moving but implacable horrors of an unsustainable world nor the urgency to respond to their threats need repeating here. Yet we view the organization and alignment of domains as fundamental to the coordination of policy development and action. Concepts, particularly as part of unacknowledged conceptual clusters, have a remarkable pull on practice. We have sought to demonstrate that partial and conciliatory efforts to annex environmental and social concerns to triple-domain accounting frameworks are problematic. The emphasis on fiscal policies and economic agendas "reveal" those concerns to be still seen as externalities that at best are costed accordingly. At worst, they are ignored entirely.

New "bottom lines" may have had a persuasive logic for the economy-obsessed 1990s, just as social, cultural, and other capitals that have developed from Bourdieusian sociology have highlighted the noneconomic resources that bear upon social structuration and change. Nor are we arguing for their dismissal entirely. Instead we wish to emphasize that political, cultural, and ecological forms of practice operate within logics and develop normative claims that are irreducible to financial or broader economic terms. Any such reduction implicitly assumes the dominance of economic practice and should be undertaken only when that practice precludes alternatives. For example, compensation for loss due to natural disasters through insurance payments or government contributions are instances where monetary payments are better than no redress.

Positive "accounting for sustainability" cannot begin by economically costing CO2 emissions, democratic representation, or cultural attachment to place. Among its other problems, this perpetuates the widely held perception of sustainability as a punitive, privative, and negative policy agenda. Instead, a common future needs to see economic activity as one among many social goods. Aside from its direct role in promoting specifically political ends, public policy has a crucial role to play in recalibrating social practices around a more balanced and holistic collection of goods. How this might be done differs from place to place and from community to community. Genuinely positive sustainability requires, among other things, openness to negotiation, self-determination, and consensus building about what a given society defines as its norms and goods.

# Domestic Violence

Wendy Mahoney
Mississippi Coalition Against Domestic Violence, Jackson, MS, USA
Jackson State University, Jackson, MS, USA

## Synonyms

Batterer or abuser; Domestic violence or interpersonal violence; Financial and economic abuse

## Definition

Domestic violence is the pattern of coercive behavior within an interpersonal relationship wherein one person in the relationship uses their power to control, manipulate, intimidate, or cause harm to the other person within the relationship. These factors can be exhibited in the following types of abuse such as physical, emotional, sexual, psychological, or financial/economic.

Physical abuse is causing bodily harm in the form of hitting, slapping, pinching, punching, or using an object as a weapon with the intent to injury. Emotional abuse entails the use of words to demean, degrade, or humiliate and, therefore, involves undermining an individual's sense of self-worth and/or self-esteem. This type of abuse tends to hurt a person's feelings. An example of emotional abuse is shouting words such as "You are dumb, stupid, and worthless. You can't do anything right so shut up talking to me." Sexual abuse is forcing or coercing someone to engage in sexual activities against their will. Manipulation and intimidation can also be used when forcing sex against a person's will. Sexual abuse includes, but not limited to, marital rape, attacks on sexual body parts, forcing sex after physical abuse, or threatening one in a sexually demeaning manner. Psychological abuse affects a person's emotional state of being wherein the abuser may play mind games to discredit an individual's overall state of being. This type of abuse may be exhibited by extreme acts of intimidation or forced isolation. Financial/economic abuse is withholding financial resources, denying basic needs, or using finances as a means of abuse. This type of abuse makes an individual financially dependent by maintaining control over financial resources.

Based on the Center for Disease Control, an intimate partner is a person with whom one has a close personal relationship. The relationship can be identified by the following characteristics: emotional connectedness, regular contact, ongoing physical contact, ongoing physical contact and sexual behavior, identity as a couple, and/or familiarity and knowledge about each other's lives. Intimate partners include current or former spouses, boyfriends or girlfriends, dating partners, or sexual partners.

## Introduction

Domestic violence is a global problem which is far reaching throughout society. It is seen by many as an issue facing women. Statistics state that one in four women will face an issue of domestic violence within their lifetime. Facing domestic violence is a serious, harming, and even damaging

problem. The coercive pattern of behavior places an imbalance of power within the relationship. The ultimate desire in any relationship is equality and respect. Within domestic violence respect and equality are greatly skewed. This may cause individuals to suffer in silence due to the complexities of the issues being faced in the relationship.

Domestic violence is not simply two people who physically hurt one another because they cannot control their tempers during an argument. But, the core issue of domestic violence is much more insidious. Battering or abuse is a pattern of behavior that seeks to establish ***POWER*** and ***CONTROL*** over another person through fear, harm, and intimidation. Batterers believe they are entitled to control their victims. They believe that threats and violence are acceptable and will produce the desired results.

## Risk Factors

Domestic violence has no socioeconomic status, ethnicity, racial identity, gender, religious affiliation, age, geographical location, or educational background. These factors have no specific relevance concerning domestic violence. This issue crosses all segments of the population; therefore, its impact can be far reaching and quite devastating to any individual. Due to the nature of the problem, it also intersects with various societal issues. There are intersections with homelessness, LGBTQ, AIDS, incarceration, child abuse, and poverty. The intersectionality of domestic violence that intertwines with other life-altering issues adds more layers to such a harmful situation. Many individuals throughout the world deal with these issues and domestic violence can at times be a precursor to these oppressive problems. Domestic violence occurs in both opposite-sex and same-sex relationships. It can happen to intimate partners who are married, living together, or dating.

## Cycle of Abuse

The cycles of abuse within domestic violence display a pattern of behavior. The cyclical behavior is a tactic of the abuser which can invoke fear in the victim. In a cyclical process there tends to be no end to the situation because it is continuous. The cycle of violence often repeats itself over and over with increasing levels of violence.

Behaviors of victims and offenders show that family violence is usually a continuing, entrapping cycle. First, tension begins to build. Demands are increased, stress escalates, and put-downs are frequent. Tension leads to an explosion, such as hitting, humiliating, and controlling. After the blowup, both the victim and offender lapse into a honeymoon phase during which the problems are denied, love is declared, or promises are made. The victim finds new hope and believes the relationship will change. However, the issues that initially caused the violence were not addressed and still exist.

**The honeymoon**

"Everything is beautiful."

Denial of the problem and some sense of forgiveness.

Forgive and forget; exchanges loving words.

Blames victim for the violence.

**Tension building**

Something is triggering the violence.

Stuffs feelings; justifies spouse being late; "put-downs."

**The explosion**

Unable to diffuse the tension and rage

Slams door; throws magazines; scratches

Wrestles to the ground; holds hair

## Why Do They Stay

Choosing to leave or stay with an abusive partner is an individual and personal decision. The decision can be based on many different issues and factors and therefore should never be taken lightly. A person may stay in an abusive relationship while facing many obstacles and resorting to coping mechanisms when dealing with the difficult situations. One of the most common reasons for staying is love. It is the primary reason for being in a relationship. There may be other reasons to stay such as religious beliefs, societal norms, fear, lack of financial resources, or

children. The thought of a child living without their parent can cause the victim to feel as though they must stay for the sake of their child(ren).

Due to deep-rooted values and culture, many women rather not end their relationship in separation or divorce. There is oftentimes the fear of the consequences of reporting violence and a declaration of an unwillingness to subject themselves to the shame of being identified as battered women. Lack of information about alternatives also forces women to suffer silently within the four walls of their homes. Isolation and lack of resources may be contributing factors because the victim may not have access to resources or supports. Some women may believe that they deserve the beatings because of some wrong action on their part. Other women refrain from speaking about the abuse because they fear that their partner will further harm them in reprisal for revealing family secrets, or they may be ashamed of their situation.

The abuse doesn't transpire on a regular basis making the reasons for staying amplified. The victim gains hope that the abuse will stop. This reason coupled with other reasons makes staying more tolerable at points in time. The glimmer of hope shadows the belief that the relationship may shift to resemble the desired hope.

## Myths Associated with Domestic Violence

There are many myths and misinformation about the causes of domestic violence. Alcohol and drugs do not cause someone to become aggressive. They are, however, used by abusers as an excuse to abuse. It has been stated that domestic violence only happens to poor women and women of color. Domestic violence happens in all kinds of families and relationships. Domestic violence is not affiliated with one specific race, ethnicity, or socioeconomic status.

A major and damaging myth is stated oftentimes referencing that if it were that bad, she would leave. There are many reasons why a woman may not leave. Not leaving does not mean that the victim wants to be abused or is in agreement with the treatment being received. The most dangerous time for a victim is when she tries to leave the relationship.

## Why Abusers Abuse

Abusers may abuse due to learned behavior and an overall societal acceptance of violence. The abuse is more likely to occur if the abuser witnessed violence or was victimized as a child. Battering can be seen or understood as an internalized issue in which an individual has difficulty recognizing or expressing feelings. Battering is not an inability to express feelings or wants, but a method by which an abuser does so (Men Stopping Violence 2013). The method of expressing feelings and communication is used as tactics to abuse. Issues of male privilege and sexist beliefs or practices can also be the source of abuse. Addressing any of these issues of violence perpetuated by abusers must begin with dealing with the source of why an abuser abuses.

## Impact on the Family

Domestic violence can also cause negative effects on children who witness domestic violence. Almost 30 million American children will be exposed to family violence by the time they are 17 years old and one in four American children will experience violence between their parents/caregivers – that's about 20.5 million children (Finkelhor 2008). Children that are exposed to violence are more likely to attempt suicide, abuse drugs and alcohol, run away from home, engage in teenage prostitution, and commit sexual assault crimes. One in four children (26%) was exposed to at least one form of family violence during their lifetimes (Hamby 2011).

There can be lasting effects on the family such as lack of honest communication among family members causing a chaotic household. Families may lack boundaries and respect therefore exhibiting maladaptive social learning regarding violence. Heightened tension, anxiety, and even

emotional enmeshment possibly lead to a defective perception of family relationships and dynamics. All of these could lead to divorce and a breakdown in the family unit.

## Economic Impact of Domestic Violence

The financial impact of domestic violence affects victims and families of domestic violence as well as the entire community. It also affects all systems such as the criminal justice, medical, social service, legal, family, and educational. According to the National Intimate Partner and Sexual Violence Survey (NISVS) 2010 Summary Report, more than one in three women and approximately seven million women are raped and/or physically assaulted by a current or former intimate partner each year. The US Department of Justice has found that women are far more likely to be the victims of violent crimes committed by intimate partners than men, especially when a weapon is involved.

Individuals who are victimized by domestic violence interface with many systems, therefore impacting many systems. A victim can interface with law enforcement, legal, medical, mental health, shelter services, counseling, human services, and other systems as they navigate resources of support.

Based on the 2003 report, "Costs of Intimate Partner Violence Against Women in the United States," the costs of interpersonal violence against women exceed an estimated $5.8 billion. The report also indicates that of these costs, approximately $4.1 billion is the direct cost of medical care and mental health care. The remaining costs are indirect costs which are lost productivity equaling approximately to $1.8 billion.

These costs create an increase in demand for services for victims experiencing the devastating effects of domestic violence. These systems are affected due to the financial obligations and resources utilized in the prevention, support, care, and execution of laws as a result of domestic violence. The overall work force is affected due to the reduced productivity of victims. The reduced productivity could be absenteeism and low work output, affecting both the business and victim.

## National Policies

Congress has made a commitment and significant impact to improve the lives of domestic violence victims. The Family Violence Prevention and Services Act (FVPSA) was enacted in 1984 and foundational to domestic violence victim services. In 1994, the landmark Violence Against Women Act (VAWA) assisted in the paradigm shift of responding to domestic violence, sexual assault, dating violence, and stalking in our country. The federal government has allocated funds to address the increasing public health problem. VAWA saved about $12.6 billion dollars in net averted costs in its first 6 years.

Taking a look at the costs associated with domestic violence is a component for explaining the importance of funding the prevention of this violence. Estimating the economic impact and costs of such violence can assist policy makers and funders in the adequate allocations of resources. Based on the publication, "Making the Case for Domestic Violence Prevention," both policy makers and service providers possess the same goal – to increase the public good. The issue tends to be how this information is communicated. Therefore, it is imperative that the economic costs of domestic violence including estimated annual costs of prevention services, law enforcement, medical care, mental health, and all other costs be analyzed.

> The challenge for violence prevention to address in the years ahead is to systemically establish a solid base of evidence about the costs of interpersonal violence in all societies, and then to feed this evidence into policy making and advocacy where it can complement and strengthen the moral arguments for the prevention of interpersonal violence.

> Department of Injuries and Violence Prevention, World Health Organization, Geneva, 2004

## Public Health Impact and Prevention

Domestic violence is a serious, preventable health problem affecting more than 30 million Americans annually, yet there seems to be limited resources for prevention of this issue. Prevention of domestic violence on a massive scale will require a commitment from all levels of government. This type of commitment will foster the goal of establishing a consistent, coordinated, and integrated approach for each community (Wolfe and Jaffe 1999). The public health model describes prevention in terms of primary, secondary, and tertiary prevention interventions. In this model, primary prevention costs society far less than secondary and tertiary interventions. Secondary and tertiary interventions are needed when primary prevention efforts are not widespread or powerful enough to stop the violence before it occurs (Transforming Communities Technical Assistance, Training and Resource Center 2006). Primary prevention policies and programs help prevent violent behavior through interventions designed to eliminate the underlying causes and risk factors and strengthen protective factors (World Health Organization 2013).

The ecological model for understanding risk factors and root causes for violence assists in identifying as well as addressing prevention strategies. The model views interpersonal violence based on the outcome of interaction among many factors at four distinct levels: individual, relationship, community, and societal. The individual level is influenced by personal history and biological factors which directly impact behavior and increase the likelihood of becoming a victim or a perpetrator of violence. Examples of these factors are being victims of child maltreatment, psychological or personality disorder, alcohol and/or substance disorder, and a history of severe aggressive behavior or experiencing abuse. The personal relationship level such as family, friends, intimate partners, and peers may influence the risk because of having a violent friend, partner, or peer. The community level including schools, neighborhoods, and workplaces can also influence violence. Level of unemployment, population density, and existence of a local drug or gun trade are examples of factors that influence the community level. The societal level factors influence whether violence is encouraged or inhibited within the community-at-large. Economic and social policies maintain socioeconomic inequalities between people, prevalence of weapons, social and cultural norms, and male dominance. Oftentimes cultural norms within society endorse violence as an acceptable method. These influences greatly impact how interpersonal violence is perpetuating in our communities as a whole.

Domestic violence is systemic – meaning it takes place in a system that allows and even contributes to this violence (Transforming Communities Technical Assistance, Training and Resource Center 2006). Since it encompasses all of these systems, it makes sense to address domestic violence from a systemic approach, therefore, including education, health, government, law enforcement, religion, family, media, criminal justice, human services, and social service systems. This approach would be cross-sectional in nature recognizing the interconnectedness of the root causes of domestic violence. The prevention strategies will be generated on a spectrum of community change. This spectrum would be implemented on various levels of operation and implementation.

Coordinated community response models tend to be the most utilized systemic approach to prevention measures in the domestic violence field. A response model touching various parts of the community and systems in a collaborative manner can prove to yield a greater understanding and awareness of the issue being addressed. The greater the value of a program in the overall effort to prevent domestic violence, the greater its cost-benefit. The key to assessing whether these will attain the outcome desires is the availability of resources to conduct the activities and initiatives (Jenkins and Hutchinson 1996). Addressing prevention and its cost-benefits can be a valuable component to combatting such a serious community-wide issue.

## Conclusion

Domestic violence is a widespread societal problem with consequences reaching far beyond

the family. It is conduct that has devastating effects for individual victims, their children, grandchildren, family members, friends, and their communities. In addition to these immediate effects, there is growing evidence that violence within the family becomes a way of life and is the breeding ground for other social problems, such as substance abuse, juvenile delinquency, and violent crimes of all types. Being able to understand the complexities of domestic violence situations is the first step toward assisting the victims, therefore creating prevention strategies, policies, and programming.

Due to the economic impact in addition to the public policy implications of domestic violence, a systemic approach must be analyzed to address the issues. Congress has made great headway in implementing policies with funding to support victims and survivors. These efforts are admirable; however, the importance of a coordinated community response approach may be the most effective method to dealing with an issue with such vast intersectionality in our society.

# Donor Withdrawal and the Implications for Public Governance in Latin America

Susan Appe and Fabian Telch
Binghamton University, Binghamton, NY, USA

## Synonyms

Aid reconfiguration; Aid reduction; Donor shifts; Post-aid conditions

## Introduction: Donor Shifts and Withdrawal in Latin America

Traditional official development assistance (ODA) is channeled by the 29 OECD countries that are part of the Development Aid Committee (DAC). ODA includes economic "flows to countries and territories on the DAC List of ODA Recipients" for the "economic development and welfare of developing countries as its main objective" (http://www.oecd.org/). The DAC aims to coordinate development programs given the economic situations of the donor countries. Most of the funds are designated to projects financed directly by embassies or international cooperation agencies such as the US Agency for International Development (USAID), Swedish International Development Cooperation (SIDA), or Canadian International Development Agency (CIDA).

ODA annual disbursement to developing countries has increased during the 2008–2014

period from 87.114 million US dollars in 2008 to 94.662 million US dollars in 2014 (an increase of 8.66%). During this period, countries such as Morocco, Mozambique, Sudan, Tanzania, Vietnam, Bangladesh, India, Pakistan, Afghanistan, Iraq, and the West Bank and Gaza have received the most ODA disbursements. Even as ODA resources have increased globally, the ODA annual disbursement to Latin American and Caribbean countries has decreased from 7.015 million US dollars in 2008 to 6.503 million US dollars in 2014 (a decrease of 7.87%). In 2014, of the total ODA disbursements to countries and regions (94.662 million US dollars), approximately 7% were directed to Latin America and the Caribbean (6.503 million US dollars). In the region, countries such as Haiti, Guatemala, El Salvador, Mexico, Colombia, Brazil, and Peru have received the most ODA resources from 2008 to 2014 (http://stats.oecd.org/Index.aspx?DataSetCode=TABLE2A). Traditional ODA to Latin America has supported programs related to environmental protection, human rights, indigenous rights, gender, democracy strengthening, health, education, and poverty (Mesa de Articulación 2014).

Many regions in the Global South have entered into a "post-aid" period according to development scholars (Banks et al. 2015) as the aid architecture is changing. Latin America in particular is undergoing shifts related to international assistance, and this has implications for public governance and the provision of public goods and services. There are several examples of shifts and withdrawal by aid agencies in the region. In September 2015 the Danish cooperation (DANIDA) announced its withdrawal from Bolivia due to the reduction of resources and a change of strategy by the Danish government, focusing instead on African and Asian countries. These cooperation resources were part of government-to-government agreements, and Bolivian public entities will be the most affected. In 2014 the Danish government invested 25 million dollars to Bolivia to finance projects against poverty, good governance, and human rights (ANF 2015). The withdrawal of the Danish cooperation assistance in Bolivia follows the 2013 expulsion of the Danish nongovernmental organization, IBIS. This departure was a result, according to the Bolivian government, of IBIS working with social organizations against Bolivian government interests.

In Peru in October 2015, the Belgium government suspended its bilateral cooperation assistance, aiming to explore alternative ways to invest in the country. Belgium was financing programs in Peru aimed to support access to health services and economic sustainable development. Belgium decided to change its strategy by relocating its cooperation resources to countries in war or post-conflict processes. Belgium is also withdrawing its economic cooperation from other countries in the region such as Ecuador and Bolivia (Gestion 2015).

## Contributing Factors to Donor Shifts and Withdrawal

There are several factors that contribute to the shifts in development aid; some of which are suggested by the cases mentioned above. The following presents five economic and political factors which are especially relevant in donor shifts and withdrawal in Latin America.

### Middle-Income Status Designation

Many countries across developing regions have "graduated" to middle-income country status. The World Bank Atlas method identifies middle-income countries (MICs) based on the gross national income (GNI) per capita, and the designation can change eligibility for the receipt of ODA. The benefit of graduating to MIC status can mean more favorable credit terms, yet the graduated countries often experience slowed economic development after graduating; coined as the middle-income trap (Paus 2011). Countries experience rapid development and growth until they reach the middle-income status and then experience slowed growth. After industrialization, often nations do not adopt a strong industrial policy, which leads to inefficiencies in industry and lack of competitiveness in international markets. Industrial economies are not adequately

replaced with technological capabilities including the resources and organizational abilities to develop thriving technology industries (Paus 2011). Using GNI, almost all countries in Latin America are middle income, despite their heterogonous policies, economies, and income stratification. Indeed, MICs show great diversity within and between nations, including variable degrees of democratization, transparency, and effectiveness of justice systems (UNDP-LAC 2011).

The shifting of funds to poorer countries, according to the standards established by multilateral donors (e.g., World Bank, United Nations Development Program, and International Monetary Fund), has presented a new challenge to upper-middle-income economies in particular. The Latin American countries that are considered as upper-middle-income economies are Belize, Brazil, Colombia, Costa Rica, Ecuador, Mexico, Panama, Paraguay, Peru, and Suriname (see Table 1).

## The Financial Crisis of 2008

The financial crisis of 2008 spurred a decrease in international funding and investment. The crisis, followed by the default of big corporations in the USA (e.g., Lehman Brothers, American International Group) and the risk of solvency for many stakeholders in the financial system, influenced financial investments in the United States (US) as well as those in emerging markets and other developed countries. The deflation of the housing market in the US and the financial investments linked to this market led to massive losses for homeowners and stockholders. Due to the high interconnection of the financial markets globally, the failures in the household market in the USA were transmitted rapidly to other sectors and countries that make part of the global economy (International Monetary Fund 2009).

As part of this crisis, European and Commonwealth countries were hit hard due to their dependence to external financing, manufacturing, and commodity exports. Asian, African, and Latin American countries suffered the impacts of the crisis as well due to the decreasing value of commodity prices and weak export demands (International Monetary Fund 2009)). In addition, the effects of the crisis have affected European DAC countries which had important roles as donors of international aid for developing countries (e.g., Spain for Latin America). Consequently, donors' policies have changed and influenced the countries' cooperation agendas. In some cases aid has been temporarily cut. Other countries have reorganized their actions focusing on specific sectors such as social programs and infrastructure spending, and other donor countries have redirected their aid to multilateral international initiatives.

## Questioned Effectiveness of ODA

Traditional ODA's effectiveness has been challenged. It has been criticized for perpetuating

**Donor Withdrawal and the Implications for Public Governance in Latin America, Table 1** Latin American countries' income status (World Bank 2016)

| High-income OECD members | High-income economies ($12,736 or more) | Upper-middle-income economies ($4,126–12,735) | Lower-middle-income economies ($1,046–4,125) |
|---|---|---|---|

| | | Suriname | |

Source: http://data.worldbank.org/about/country-and-lending-groups#Upper_middle_income

inequities, being overly bureaucratized, unnecessarily duplicating services, and having arbitrary timelines, sometimes 4 or 7 years (Edwards and Hulme 1996; Schulpen et al. 2011). In addition, concerns exist about ODA's large transaction costs for recipients countries, its fragmentation within the provision of aid, and the proliferation of aid actors (Schulpen et al. 2011). Development projects have been accused of converging neoliberal interests with social development objectives. Donors have used financial pressures and contracting authority to push local governments and civil society organizations (CSOs) to act as donor agents, at times favoring recipients with better access to technology and/or with Western-educated staff.

There have been efforts to address these concerns. The Paris Declaration of Aid Effectiveness of 2005, endorsed by countries, international, and CSOs around the world, aimed to establish guidelines to make aid more effective and to commit more resources to development. The declaration seeks to implement accountable measures for donors and stakeholders to monitor the impact of aid resources. The principal aims of the Paris Declaration are to strengthen development strategies and operations in partner countries (e.g., planning, budget, and performance assessment frameworks) and to develop effective partnerships between donors and partners in the field and fight against corruption (OECD 2005). For example, in Bolivia donors have tried to align their priorities to objectives in the country's National Development Plan. These actions have been difficult to implement at national, subnational, regional, and local levels due to difficulties related to the coordination of the several development actors involved. Most of the Bolivian entities have not implemented a model to manage results, and this had made the monitoring and evaluation of actions by the government and donors more difficult to assess (Espinoza and Terrazas 2010).

### Militarization of Aid

Although a universal definition of the militarization of aid does not exist, its implementation is prevalent in Latin America. Development strategies have often been driven by political and security interests of donors. For example, since the 2001 9/11 World Trade Towers' attacks, aid by US government has become an instrumental foreign relations' tool key to fighting terrorism, mixing war strategy with development aid. In Central America, the US militarization of aid in countries such as Mexico and Honduras has been related to the fight against drug trafficking activities that has led to the increase of violent crimes and displacement of people in the region (Main 2014).

The Andean region in Latin America has seen a substantial mix between development aid and military aid through different military and diplomatic activities which seek to combat drug cartels and, in some cases, local guerrillas. For example, the aid designated to Colombia as part of the Plan Colombia influences the quantity of aid in the region, as Plan Colombia by itself represents approximately 40% of the total aid. As such, Colombia is the country that receives the most development aid in the region (Mesa de Articulación 2014). Plan Colombia has been a strategic alliance between the Colombian and the US government to fight against drug trafficking by strengthening governance, security, and social development in the country. Most of these resources (9.637 million US dollars in total from 2000 to 2015) was earmarked for the military and police forces of Colombia to improve their training, equipment, and mobility and increase the number of members (80,000 new police officers and 50,000 new soldiers) (Presidencia de la República de Colombia 2016).

Colombia, however, is not the only Andean country which has experienced the mix of aid with military objectives. Donors in Peru have combined promoting alternatives to drug production and the eradication of the coca leaf with projects seeking to alleviate poverty. In Ecuador the militarization of aid included the US military base in Manta used by US military forces from 1999 to 2009 to fight against drug trafficking in Latin America. After Rafael Correa became the president in Ecuador in 2007, he set out to disrupt international intervention in the country, and closing the base became one of the strategies to advance this goal.

### Geopolitical Shifts in the Region

The lack of clear aid effectiveness as well as the militarization of aid might be related to and contributing factors to a turn to the left, or a "pink tide," in the region. National leadership has shifted to the left in countries of all income levels, in high-income economies such as Argentina's Cristina Fernández de Kirchner (2007–2015), upper-middle-income economies such as Ecuador's Rafael Correa (2007–present) and Brazil's Luiz Inácio Lula da Silva (2005–2010) and Dilma Rousseff (2011–2016), and low-middle-income countries like Bolivia's Evo Morales (2006–present). These shifts have had many implications on the region, including influencing international aid.

Referred to as twenty-first century socialism, several left-leaning governments in Latin American and Caribbean countries have created an 11-country allegiance (Antigua and Barbuda, Bolivia, Cuba, Dominica, Ecuador, Grenada, Nicaragua, Saint Vincent and the Grenadines, Saint Lucia, the Federation of Saint Kitts and Nevis, and Venezuela) called the Bolivarian Alliance for the Peoples of Our America (*Alianza Bolivariana para los Pueblos de Nuestra América – ALBA*). ALBA is based on socialist principles and seeks to solidify regional integration for increased social welfare. ALBA has encouraged members to expel international, foreign aid that is directed to CSOs with "political missions." In 2012, ALBA participants announced that each of the nations should expel the US Agency for International Development (USAID). In 2013 President Morales expelled USAID as Morales viewed USAID's support for CSOs, including indigenous groups who opposed Morales' use of indigenous land, as undermining his government (Ellerbeck and Soloway 2015). In 2014, USAID left Ecuador after over 50 years of work and $800 million invested in a variety of development initiatives including economic growth, biodiversity, public health, and civil society (Solano 2014). However, there is some evidence of challenges for left-leaning governments with the death of Hugo Chavez in 2013, who was a prominent voice. This has included protests in countries since 2014 about government policy in countries like Ecuador, Venezuela, and Nicaragua.

## Implications for Public Governance

New challenges for international aid in Latin America are produced by both economic (MIC designation and the financial crisis) and political (questioned effectiveness, militarization, and geopolitical shifts) reasons. As such there are implications for public governance and the provision of public goods and services in the region.

**New aid models and actors**. Given the shifts, the recent years have brought about attempts to establish new ways of cooperation between countries, pulling in more actors into aid relationships. For example, countries with similar development standards or middle-income status countries have experimented with South-South development cooperation (SSDC). SSDC seeks to strengthen ties and establish more equal relations between countries with similar economic and social conditions. It is the exchange of knowledge and resources, often among MICs. Another example is triangular development cooperation (TDC). TDC includes a DAC country and what is considered an emerging economy (e.g., Brazil, South Africa) which is not a member of the DAC (at least not yet), partnering up with a recipient country (e.g., a "developing" economy such as Bolivia).

Models like SSDC and TDC have challenged aid leadership, budgeting, coordination, and accountability frameworks. They include new actors in aid assistance like Brazil and China. In the case of Brazil, the country has developed important alliances and economic blocks such as the BRICS (the acronym for emerging economies: Brazil, Russia, India, China, and South Africa), G-20, Mercosur, and UNASUR to become important actors in South American aid. This role has been garnered by investing in the financial sector and public companies of neighboring countries such as Venezuela, Bolivia, and Ecuador (Hirst 2006). Within this strategy, the Brazilian Development Bank (BNDES) and the oil company (Petróleo Brasileiro SA – Petrobras) have become important actors in the consolidation of Brazil's internationalization strategy (Bartesaghi 2014), even as the Brazilian economy began to weaken in 2015. These new actors and new aid relationships can still be connected to political and

economic interests of the donor country. For example, Chinese businesses (in particular in sectors such as oil, mining, ports, and highways) are involved in aid programs, and some countries in the region (e.g., Ecuador and Peru) have identified conflicts between unions and Chinese enterprises on issues such as labor and environmental rights (Mesa de Articulación 2014).

Still, new aid models might allow for greater autonomy for development actors within international cooperation as they can center on regional integration and abandon reliance on international financial institutions which still remain committed to traditional development frameworks. In Latin America in particular, models like SSDC are thought to be about "dignity, sovereignty, and [regional] integration" (Molina et al. 2011), p. 255).

**Providers of public goods and services challenged, particularly CSOs**. In some contexts in the region, CSOs have been likely providers of public goods and services. CSOs have been known to have the capacity to produce innovative solutions to complex problems. Because of this, CSOs have been major preferred implementors for international donors. In 2011, 14.4% of ODA through DAC members was channeled to and through CSOs, and 20.5% of total bilateral ODA was channeled to or through CSOs (OECD 2013). However, given the reduction and shifts in aid, CSOs have diminished their range of action and reduced their own staffing and presence. Relations with governments are appreciated but do not guarantee the sustainability of CSOs in the provision of public goods and services they provide. Generating new financial resources is a critical issue for many providers of public goods and services in the region.

In addition, transparency is a key factor for these CSOs in order to legitimate their role in public governance. In many countries there are mixed opinions about CSOs, mostly due to a perceived lack of accountability and weak ability to demonstrate results. For example, in Peru there have been strong attacks against CSOs for their inefficiencies and misuse of resources, even if these accusations are a result of the action of a few organizations. In this sense, some CSOs have established accountability processes to present their results to stakeholders and garner new donors, both international and local (Mesa de Articulación 2014). Several networks of CSOs have produced documents of collective accountability reporting to better communicate their value in the provision of goods and services. In Ecuador, since 2011, the now Ecuadorian Confederation of Civil Society Organizations (CEOSC) has released its collective accountability reports of aggregated descriptive data on organized civil society. Three reports of collective accountability have been released in 2011, 2012, and 2015. The collective accountability reporting commits the participating organizations to accountability, defined as "an expression of responsibility" which includes the values of "transparency and ethics." Noteworthy is the most recent report of 2015 which observed that the biggest change in the composition of resources for CSOs in Ecuador was in international cooperation, which fell from 37% in 2013 to 23% in 2014 (Confederación Ecuatoriana de OSC 2015).

One of the most important challenges for CSOs as providers of public goods and services in the future is to garner greater endogenous support. New directions for CSOs have been put forth to explore more endogenous approaches versus exogenous approaches. For example, new organizational considerations among CSOs include collaborations, mergers, and downsizing in addition to increasing networking among organizations. New revenue sources and modes of self-financing (e.g., government funding, commercial activity, private philanthropy, and diasporas and remittances) also have been put further and require greater consideration by CSOs and other development actors (see Appe forthcoming).

## Conclusion

In sum, the factors that influence the changes in aid architecture – i.e., donor shifts, withdrawal, and reductions – are interrelated and economic (financial crisis and MIC designation) and

political (questioned effectiveness, militarization, and geopolitical shifts) in nature. As demonstrated, the shifts in ODA will have implications on public governance and on the provision of public goods and services in the Global South, particularly in Latin America. Implications include new models and actors in international aid, which will provide new opportunities for international cooperation. In addition, CSOs as providers of goods and services will be affected, but funding constraints might offer new opportunities for innovations and the establishment of endogenous leadership in development in the region.

# Donors' Expectations: Lessons for Administrators

Kathryn E. Webb Farley and Robert D. Eskridge
Appalachian State University, Boone, NC, USA

## Synonyms

Donations; Hybrid Organizations; Major gifts; Mega gifts; Philanthropy

## Definition

As hybrid organizations, public universities combine public, for-profit and nonprofit entities under institutional umbrellas.

Mega gifts are those donations that are large enough to create transformational change within the institution.

## Philanthropy in Public Higher Education

Some public organizations seek private donations as a way to support initiatives and operations. Appealing to philanthropists may be particularly attractive when state appropriations are lacking. For example, dwindling public resources devoted to state higher education institutions, coupled with political constraints on rising tuition levels, leaves public universities seeking private sources of funding to carry out a range of activities. Public higher education funding today is lower than pre-recession levels when adjusted for inflation, while enrollment levels have grown by four million students since 1989. The result is pressure to educate more students with less public support.

Therefore, public higher education institutions seek out other revenues, such as grants and contracts, earned income through business-like functions, and philanthropic dollars. In 2014, institutions raised more than $38 billion, an all-time high (Mulhere 2015). As state funding dwindles, these large donations represent an important piece of the funding puzzle public university administrator's find themselves assembling each year.

The reliance on philanthropy, along with political and organizational constraints, raises interesting questions about the ability of administrators in public universities to meet donors' expectations. This is a particularly salient topic given the modern notions of philanthropy as an investment for which donors seek a return and are willing to sue if expectations are not met (Thelin and Trollinger 2014). Therefore, it has implications for both philanthropists, who want to create change with donations, and university administrators, who want to attract gifts.

## Fundraising at Universities

Since the 1970s, donations at universities have taken a more central position in an administrator's hiring, expected skill sets, and duties (Thelin and Trollinger 2014). Scholars have argued that rather than building institutions, today's fund raising campaigns are more about stimulating organizational change and transformation (O'Brien 2005).

Perhaps because of the success universities experienced with using donations to build institutions in the United States, this view of philanthropy lacks in its critical assessment of such transformation. Instead, it accepts that donors light the path for a brighter future. Research on the changing nature of philanthropy suggests that from an administrative standpoint, more critical reflection is necessary, however.

## Donor Expectations for Return on Investment

Philanthropic discourse has shifted from an emphasis on giving to a focus on investment, referred to as new or venture philanthropy (Eikenberry and Kluver 2004). This new conceptualization of philanthropy, with its focus on "...issues rather than institutions" (Eikenberry and Kluver 2004, p. 134), raises concerns about whether these new donors are more concerned with addressing individual problems or enhancing

the institution itself. Scholars argue that reliance on such donations can be particularly problematic when gifts are so large as to be capable of creating significant change in focus in the institution, thus giving the donor control. Such donations may work in changing the institution in ways that either change or are incongruent with institutional priorities (Ostrander 2007; Hirsch 1999).

These large mega gifts are usually received by higher education and directed toward a specific purpose rather than general funds (Stephenson et al. 2009). These are gifts of such magnitude that they can be termed "transformational giving" and are donations that have, "...unique capacity to alter the programs, perceptions, and future of an organization" (Grace and Wendroff 2001, p. 15).

If the relationship does not allow or encourage direct donor involvement so that the philanthropist knows the true needs of the organization, however, then the donations may result in changes incongruent with institutional priorities (Ostrander 2007; Hirsch 1999). Some argue that these large wealth holders are "hyper-agents...capable of establishing the institutional framework within which they and others live" (Schervish 2005, p. 60). In part, the choice to donate is dependent on belief in mission of the organization (Costa 2005). Beyond the mission, in studying the nexus between fundraising and financing, Costa argues that key stakeholders, including donors, should be involved in "identifying, prioritizing, and funding its needs" (p. 13).

## Questioning Philanthropy

The implicit question is what defines effective fundraising, the amount of dollars raised or something more? One way to answer this question may be by broadening our understanding of philanthropy to include the implications for institutions. Scholars recognize that we do not have a good understanding of fundraising and its effects on institutions (Pribbenow 2005). Given the increasing focus on fundraising we find in public institutions, including higher education, this becomes a problem as it relates directly to the "publicness" of institutions.

As organizational forms change and institutions have increasing autonomy, management may be faced with more pressure from nonpublic external actors. As administrators are restricted to particular purposes, decisions are politicized, a process we must better understand to ensure appropriate use of resources (Moulton and Wise 2010). If accountability is one measure of publicness, and as the research notes in the new philanthropy paradigm, donors expect accountability of the institutions, then we must examine the effects of these shifts. There is very little empirical research that gives a better understanding of mega gifts and the entities that make them or how organizational management responds to these gifts in terms of overseeing the institution (Stephenson et al. 2009).

To date, most research on philanthropy focuses on donor motivations and characteristics and implementation of successful fundraising programs. A great deal of focus is on questions of giving, exploring why people give to particular things and how can institutions get more (Thelin and Trollinger 2014). The lack of focus on the aftermath of philanthropic donations, particularly those that are of such a magnitude as to be transformational, is problematic.

## Outcomes of Gifts

Evidence from a $100 million gift to the University of Virginia (UVa) and a $10 million donation to Virginia Tech (VT) suggests that public university administrators and donors should be prepared to address management concerns about work, resources, and the built environment. Although very different in size, in both of these cases, the gifts were the largest in school history at the time the donations were made. Each created a new interdisciplinary unity in which the donor hoped to see a change in the educational and research productivity of the recipient university (Webb Farley 2016).

### Institutional Strife

In both cases, donors gave resources hoping to facilitate interdisciplinary engagement that builds

on the strengths of existing faculty while adding faculty to generate new educational and research opportunities. In short, donors in both cases hoped to transform some part of the university. Both cases demonstrated that existing institutional cultures and pressures can constrain the ability of a gift to quickly create substantial change. In short, money does not solve everything, although it is necessary, along with ideas and leaders, as change undertaken by and dependent on the actions and reactions of people (Curti and Nash 1965).

In the case of UVa, there were outward expressions of dissatisfaction and concern. First, there was a failure of the Faculty Senate to publicly support the new school immediately after the gift announcement, largely due to a focus on leadership, a scholarly endeavor questioned by some. Second, shortly after the gift was made public, a visioning committee directly expressed concerns for creating new campus entities that may compete with existing entities for resources.

At VT, while outward support was expressed through planning documents, there has been limited institutional change. Although an undergraduate degree program was established, no interdisciplinary graduate programs have been created although this was an original goal. Second, collaborative research has not been as fruitful as hoped. Third, concerns about resources, particularly new donations but also physical space, have resulted in restructuring the unit's Advisory Board only 5 years after the gift announcement. Lastly, the naming of an outside faculty member as director suggests there was mistrust and dissension among the faculty of the two programs initially envisioned as collaborating.

A gift large enough to ensure that the new entity becomes a central piece of university planning efforts may also help to overcome existing institutional resistance. The UVa gift was so large, the university created a college-level entity that reports to senior administration. The University has made the donor's primary subject of interest, along with the new entity, part of its strategic planning efforts since the gift was made. VT's $10 million donation developed a shared school between two less-prominent programs within large colleges. Although the Colleges at Virginia Tech both noted the need to focus on the new School as part of strategic planning, it has not been prominent in university-wide planning documents and organizational strife has occurred, in part because of control of resources.

### Control of Resources

The struggle for control of the resources is apparent in both cases. In both cases, the gift was made with the idea that faculty from other departments would participate in making the unit successful. This sharing of resources seems to have resulted in a struggle for control of the resources, not uncommon in organizational change in resistance.

The problem was noted by UVa faculty even prior to the creation of the new unit, as confirmed by the suggestion that a confederation would be the best way to implement a collaborative program from across disciplines. A confederation suggests that entities maintain control and work with each other through loose connections, rather than working together through a centralized entity that controls resources, such as a school. After the school was created, interviewees suggested that there was continuing concern and struggle over the new entity's use of current resources, such as space and faculty, and future resources, such as donations.

At VT, the struggle for control is particularly apparent in two ways: resistance to the founding director and struggles over an Industry Board. That the second director needed to be perceived as an "honest broker" and the need for consultants to help facilitate collaboration suggests that the first director was not a unifying force. The struggle over the Industry Board structure and resources suggests that while the intention was to bring together related entities into one structure, the perception of university faculty was that doing so removed resources that would otherwise have been dedicated to pre-existing programs.

These findings support the Stephenson et al. (2009) findings that change wrought by gifts can result in organizational management crisis. Choosing a leader, changing organizational charts, and providing resources for education and research is not enough. System actors may actively or passively work to control resources, thereby decreasing the impact of the gift.

### Physical Space

In addition to people, physical space appears to matter. The importance of campus space has long been recognized by universities. Thelin and Trollinger (2014) one of the concerns of institutionalizing public universities was building campuses that had a unique identity. Both UVa and VT have distinct campuses, with the former's "Central Grounds" adorned with buildings built in the architectural style of its founder, Mr. Jefferson, and the latter giving a nod to both its military history and its regional heritage with gothic building constructed from locally mined "hokie stone."

The symbolic nature of space was noted in both cases. First, in the UVa case, the new Batten School was given a space on the crowded "central grounds," which required the removal of existing institutional actors. This signifies importance of the school by putting it in the center of campus, notable on a campus that has been expanding its borders outward for lack of space, and also by removing people already in their offices. In the VT case, rather than giving them a new building primarily for the new school, the building was constructed for an existing program, with the school being an addition after the building was secured. The new on-campus building was notable for the Building Construction faculty, who had been housed in subpar, off-campus facilities in the years when they feared for the programs survival, but was seen as a barrier for other faculty who were not part of the original building plans.

## Lessons for Administrators

As both of these cases demonstrate, an infusion of multimillion dollar donations will not necessarily result in smoothly overcoming existing organizational boundaries to transform the institution. The difference in the cases, however, is also instructive. The UVa gift was so large that it created an endowment that was largely able to support most of the operational costs of the program and allow it to incentivize faculty from across campus to participate in its education programs and research. VT's gift, however, required ongoing support from the university and two colleges. Therefore, it could be that if donors want to speed, or perhaps ensure, the success of their gift in creating institutional change, they must give a gift that is large enough to be largely self-supporting and to incentivize participation across organizational boundaries. School administration should be concerned about the ability of the gift to create a desired return on investment. Otherwise, stewarding the donor for a future gifts.

Both schools now consider faculty from other departments as part of their faculty, suggesting that change can occur quickly, at least nominally. Moreover, the dual missions of education and research may be served differently. The VT case suggests that students will benefit most from this work rather than research, while the UVa case demonstrates that advances in research can be made with the addition of new faculty. Therefore, both donors and administrators may want to consider the number of new faculty that can be hired, as well as where the tenure lines our housed. While UVa suggested a confederation might be the best structure prior to the gift, the VT evidence suggests that the placement of tenure lines might matter. If tenure lines are placed outside the new entity, it could foster identity with the existing departments rather than the new entity.

These cases suggest that both donors and recipients should consider the physical location of new programs. The placement on campus can have real and perceived barriers that may enhance or impede progress. Moreover, because space is a tangible resource, this may become a focal point of contention, particularly in universities, in which people subunits are only loosely connected and symbolic action is particularly important (Birnbaum 1988). Therefore, the negotiation process should include all key stakeholders, in other words, both faculty, staff, and administration within the university, as well as keeping the donor informed.

## Conclusion

Donors of mega gifts often seek to transform the institution. In the two cases presented, donors sought to create interdisciplinary units that work

to overcome existing organizational barriers. Not surprisingly, transformation has not been easy. The findings suggest that donors and administrators may want to consider if their gift is large enough to create attainable change within the institution. Furthermore, institutions may want to consider ways to encourage faculty to work across boundaries, perhaps starting by including both administrators and faculty in gift negotiations to build support from the outset. Lastly, if education institutions are going to continue relying on fundraising to meet institutional needs in the absence of increased general or nongeneral fund revenues, scholars should engage in research to determine the best practices for gift negotiations and acceptance.

# Downsizing

Saeed Siyal
School of Economics and Management, Beijing University of Chemical Technology, Beijing, People's Republic of China

## Synonyms

Downscaling; Rationalizing; Scale back

## Definition

Downsizing comprises of a set of actions designed to improve the performance, efficiency, productivity, and competitiveness of the organizations. It also represents the strategies that affect the size of work force and work processes of the organization.

## Introduction: What is Downsizing?

Downsizing has been an important and contentious trend within organizations since the beginning of 1980s. The prominent rationale for this trend is that the huge industrial firms are thick which is unnecessary as the required outputs can

also be achieved with the fewer resources (Baumol et al. 2003). It is conceptualized as an attempt to improve the performance by reducing the organizational slack (Cyert and March 1963; Bourgeois 1981). Downsizing is the strategic exclusion of positions within the organizations. Organizational downsizing is defined as a deliberate reduction of its financial and human resources so as to increase the productivity and efficiency (Freeman and Cameron 1993). It seems to be a favorite practice for most of the troubled corporations. It started in the early 1980s with the closures of factories followed by the merging and acquisition mania, and became one of the most inevitable outcomes of living in a global era which requires frequent adjustment of products, services, and labor cost in order to survive and remain competitive. Downsizing has been creating tough scenarios for the human resources by trimming the workforce so as to enhance the creativity, teamwork, and strength by retaining the employees who are most committed and hard-working (Amabile and Conti 1999). Organizations perceive it as a very useful and effective strategy for reducing the cost by cutting down their workforce and enhance performance. This act retains only the committed employees that accept the organizational goals and give their best to achieve them (Siyal 2018; Siyal and Peng 2018).

Later in the late 1980s, almost all of the Fortune 1000 firms started engaging in downsizing, which witnessed its continuity and ensured effectual use. Several improvements in management indicated the worth of downsizing, of which the global benchmarking has been the major contributing factor. Secondly, the increasing trend of comparing the overhead cost domestically and internationally has created a convincing argument of reducing the employees. Besides, the administrative effects of revolutionary transformations in information and communication technologies have also enforced the continuity of downsizing practice within the organizations. Thus, these technological changes have led to the rising fall in the intermediary roles of the middle management. Thirdly, downsizing also balances the cost of errors made by the top management in interpreting the trends of the market (Chaudhry et al. 2015). The practice of downsizing is still in the growing stage; however, it is ubiquitous practice within the American organizations while others are also striving to engage in it. Additionally, a number of other organizations assume downsizing as a way of life in their future (Nelson 1997; Willis 1987).

## Significance of Downsizing

Downsizing is becoming the common practice in organizations due to the increasing global competition which poses the economies to undergo restructuring and vary at certain times. Several major organizations having undergone downsizing have impressed others, which include AT&T, Data General, and ITT. Downsizing has become prevalent for the organizations such that it is being considered as a last digit effort to save the life of falling organizations, such as with Chrysler in the year 1979 (Roop 1987). Later on, the well-known company, IBM also experienced the pressure to reduce its human resources (Verity 1989), although it has been praised in the past for its no-layoff policy. Hence, it indicates that downsizing is a favorable phenomenon for organizations.

Practically, downsizing is specifically important when bearing in mind the white collar and salaried work force being hard-hit and affected by the downsizing practice. Recently, their number has expanded which in turn increases the unemployment. For example, the number of non-production employees which stood 18.6% in 1950, increased to 31.9% in 1987 (Tomasko 1987). Whereas the organizations that laid off their blue-collar workforce in response to the slowdown of economy in 1980s, majority of them did not hard-hit even a single white-collar employee (Thurow 1984). This estimates that rise in the productivity of blue collar was greater than the laid off by the downfall of white collar. In addressing this imbalance, organizations need more knowledge of the consequences when they downsize in terms of white-collar workforce and redesigning to perform more efficiently and effectively. In terms of theoretical perspective, downsizing is essential due to the reason that only few

empirical studies and less theoretical support exist as a supportive explanation of the consequences of intentional downsizing of organizations. This is somewhat because of the former bias within the organizational theory where the development was recognized as not only desirable but also as an undeniable sign of accomplishment and effectiveness (Whetten 1980).

## Salient Issues of Downsizing

Though downsizing is relatively a new and effective practice in the organizational life which started in the early 1980s, it has gotten a huge attention of the research focusing on various issues concerning the subject studies that have led to several significant findings. Downsizing has been practiced by the organizations to get the maximum output from the minimum effective and efficient resources followed by the layoff of employees and shortening of the organization space. The widespread and organized survey of the downsizing practice in corporate side is largely examined in a 4-year study by Cameron et al. (1991, 1993), Freeman and Cameron (1993), and Cameron (1994), which offers a comprehensive framework of downsizing process as well as focusses on the implementation strategies, organizational effects, and best practices. The main finding indicated a negative relation of downsizing via layoffs with organizational effectiveness, which gives rise to issues in the subject matter. The whole study is based on the organizations that point out the effective and efficient management of the systems of human resources management and highlight it as an important factor for successful downsizing. Hence, in order to resolve this inconsistency, it is needed to examine the process of downsizing from the perspective of individual employees.

Unfortunately, most of the preceding literature has followed this line of study (Freeman 1994; Feldman and Leana 1994). The employees when practicing downsizing in corporate offices, organizations, or research arenas are still treated as liabilities despite of being the assets. The emotional experience of individuals in the downsizing process is seen to get a short shrift up to yet which is not favorable for the organizations and their success. It shows the varying nature of the relationships among individuals and organizations as well as warrants further attention. Moreover, it mentions that the organizations cannot be successful when they have demotivated employees and seeks for their consideration in this regard.

## Attributes of Downsizing

There are four main attributes of downsizing that specifically define and identify its uniqueness from other relevant practices and concepts. The attributes include *intent*, *personnel*, *efficiency*, and *work processes* (refer Fig. 1).

Downsizing is not an activity occurring within the organizations, but it is purposively undertaken by the members of the organization. This implies to the first attribute of downsizing that it is an intentional activity taking place in the organizations. It distinguishes downsizing from the loss of market share, revenues, and unwitting loss of work force which are related to the organizational decline or weakening. Downsizing practice is different from the mere infringement by the milieu on performance and resources since it involves organizational action.

Secondly, downsizing often results in reduction in personnel, though it is not merely restricted to such reduction. A number of personnel lessening strategies are linked to it which include transfer, outplacement, retirement inducements, acquisition packages, dismissals, and attrition. All these activities may take place in any one part of the organizations but not in others such as it may occur in production section but not in section of engineering. Downsizing is not always

**Downsizing, Fig. 1** Attributes of downsizing

about the reductions in human resources, sometimes an organization adds certain new products and services, opens new source of generation of revenues, or acquires additional work without hiring a certain number of employees to commensurate. Later, the organization employs few workers as per output unit compared to prior employment level.

The third attribute focuses on enhancing the efficiency of the organizations. Downsizing takes place either proactively or reactively so as to cover the cost and increase revenues, or boost competitiveness. Thus, it highlights that downsizing may occur as a defense response to decline and deterioration, or it may also occur as a proactive strategy in order to raise the performance of organization. In either of the situations, it characterizes a set of actions meant to improve the efficiency of organization.

Fourthly, the downsizing practice brings variations in work progress, intentionally or unintentionally. When the human resources contract, for instance when fewer workers are doing the same piece of work, and that impacts on what work is done and how it is done. Some of the downsizing actions may comprise of restructuring and excluding work such as suspending functions, eradicating hierarchical levels, integrating units, and redesigning of the tasks which certainly lead to some sort of work redesigning.

## Who Is Most Likely to Downsize?

The organizations most likely to undergo downsizing are the ones passing through the hard time, struggle phase, and having more debt. Approximately, 26% of the cash flow occurs in terms of debt payments which was only 9% in the 1974 recession, and 18% goes into the 1982 fall (Dumaine 1991). For example, Marriot Corporation laid off 2,500 positions at the headquarters by eliminating its hotel construction and development unit. Besides, it had to provide services for more than $1 billion in debt, thus debt is considered as a cruel master which forces the organizations to take extreme steps in order to ensure adequate cash flow to overhaul it. Meanwhile, the organizations that are not involved in debt taking, together with foreign competitors, are most probable to gain substantial market share.

## Impact of Downsizing on Organizational Functioning and Productivity

During the downsizing process, the organizations distort and alienated several middle level managers and lower level staff, sell solid businesses, shortchange the research and development, and muddle the transformation of the manufacture floors. Hence, the whole organizational functioning is greatly affected by downsizing. Among the organizations that downsize well, most of them are likely to have following common characteristics:

- Downsizing is commanded by the top management with the endorsements of lower level workforce on the basis of analysis of job and tasks so as to organize the later functioning and production process.
- Both the short-term employees layoff and long-term (redesigning of the organization and systemic variation in culture) approaches are adopted, together with the wide ranging and targeted downsizing.
- Distinct attention is given to both the employees laid off from the jobs (by outplacement, substantial compensation pay, reorientation, and counselling of the family) and the current ones by boosting up the exchange of information and communication between top managers and lower level employees.
- Organizations specifically identify the existence of redundancy, surplus cost, and inefficiency by internal gathering and monitoring of the data. Later they attack on those areas particularly and treat the suppliers and distributors as partners and targets for the process of downsizing.
- Reorganization usually produces small, semiautonomous firms within big and incorporated organizations. Contrary, geographic and

product organizations usually form large and centralized units (such as information processing) within the decentralized parent organizations.
- Downsizing is regarded as a strategy that is specifically designed to increase the competitiveness of the organizations and the end to the targeted areas.

## Why Do Organizations Downsize? Some Important Perspectives of Downsizing

The question why organizations downside has been approached by several studies from several perspectives which range from the economic essentials and constraints of market, approaches on the basis of organizational theories, and ideology-based motivations to the social obligations. Downsizing has also been believed as a cost paid by the organization against maladministration by top management and their strategic errors in understanding the market (Kets de Vries and Balazs 1997; Nelson and Burke 1998). Nelson and Burke (1998) mentioned that market globalization, advancements in technology, and development of service sectors plus international benchmarking with their competitors with respect to overhead prices are the market forces motivating the organizations to undergo downsizing. Besides, there are certain organizational remunerations from practicing downsizing such as increased productivity, improvement in quality of the products and services, increased competitive gain, potential reinforcement of triumph, lower expenditures, less effective bureaucracy, better and effective decision-making, enriched communication, and greater innovativeness. Additionally, following are the broadly classified perspectives and approaches which may be useful to understand why do organizations downsize.

### The Economic Perspective

This perspective relies on the inherent and rational actions of managers and the occurrence of downsizing only for enhancing the future productivity and economic performance of organization (McKinley et al. 2000). Although downsizing reduces the costs, it may be sometimes balanced by the rise in other expenditures resulting from the adverse effects of downsizing. Thus, it is still inconsistence to conclude the rise in financial performance of the organizations that downsize (Krishnan and Park 1998). In the early 80s, the organizations used to downsize in order to reduce the costs and improve their bottom line, but today, the well-known organizations with handsome profits are tending to downsize just to become "lean and mean" (Mishra et al. 1998). Consequently, although the financial imperatives have been initially the intervening stimuli for downsizing, today there are some other nonfinancial factors that may be a motivation for the companies to downsize.

### The Arational Perspective

The attempt to address why economically sustainable and financially strong organizations undergo downsizing proposed a comprehensive framework which explained the striving of organizations toward innovation (Budros 1999). This framework is characterized by two main assumptions that link (1) the social context that may be both organizational and extra-organizational, and (2) the foundation of organizational actions which may be rational or arational. In addition, this framework highlighted four quadrants which in turn characterize four factors that lead to downsizing. The factors include size of the organization, the level of employee compensation, the degree of industrial deregulation and financial troughs and peaks, the centeredness of employees, financial and nonfinancial background of the CEOs of companies, link with the companies which have undergone downsizing, and the ratio of downsized companies treated as the role models. This framework is distinctive in a way that it disrupts the restraining conventions of rationality as well as integrates a broader continuum of perceptions for observing and practicing downsizing.

### The Ideological Perspective

This perspective of downsizing highlights two ideological elements: the ideology of employee self-reliance and the ideology of reducing

bureaucracy (debureaucratization) which proposes a rational framework that increases the validity and acceptability of downsizing practice within organizations (McKinley et al. 1998). The self-reliance ideology focuses on the facts that the employees themselves are responsible for their career growth and development, not their employer organizations. While the ideology of debureaucratization, as indicated by the term endorses, decreases in hierarchies. The organizations that adopt these ideologies are prone to undergo downsizing.

### The Institutional Perspective

The institutional perspective stresses that hunt for legitimacy and ambiguity are more effective motivators for downsizing as compared to monetary efficiency and returns (McKinley et al. 2000). It argues that downsizing has engaged on the prominence of institutionalized norms and imparts acceptability to the organizations that exercise this practice. This perspective has introduced three motivational social forces: constraining, cloning, and learning that tend the organizations to downsize (McKinley et al. 1995). As the main interest of organizations is to get thinner and smaller, the managers are forced to reduce the workforce which is in the interest of organizations and favorable for downsizing. Cloning refers to replicating the competitors and other organizations regardless of the consequences whether they are favorable or not. This act of imitation imparts legitimacy and acceptability to the managers. Finally, the learning forces arise from the educational and professional institutions which reinforce the efficacy of downsizing.

### The Strategic Perspective

The strategic perspective broadens the concept of downsizing by arguing that it is not only about decrease in human resources, but it also covers the fall in nonhuman resources of organization (Dewitt 1998). Hence, choosing downsizing approach in order to reduce workforce, viz. cost-cutting, rationalizing, and downscoping, is based on the firms, industries, and their strategy influences. In differentiating the broad and focused firm strategies, influences at firm-level (such as recent capacity developments, products arrivals and investments) were found to be the only important predictors of broad firms' choice. While the influences at industry level (such as competitors' contemporary capacity developments, products arrivals and investments) were found to be the major predictors of focused firms' choice for downsizing. The strength of strategic approach is that it highlights a comparatively unmapped and untouched aspect of observing downsizing practice as a strategic choice of the organizations in order to respond to the influences at firm and industry levels which is quite different from the ideological and theatrical perspectives.

All the above discussed perspectives (refer Fig. 2) provide alternatives to view downsizing as well as partially answer to the questions of why organizations undergo downsizing despite of inadequate proofs of their economic effectiveness to downsize, continue resorting such practices.

## Strategies for Successful Downsizing

Numerous studies have stated diverse interpretations explaining why downsizing practice in various organizations has not achieved the desired outcomes. One possible reason is the desperately simplified and unclear approach adopted by the organizations where downsizing is associated with cost reduction through headcount decreases (Kets de Vries and Balazs 1997), which will result in decrease of the human resources. Thus, downsizing needs to be part of uninterrupted renewal process of the corporates where the organizations adopt long-lasting perspectives to enhance productivity, lowering the costs, and raising

**Downsizing, Fig. 2** Perspectives of downsizing

profitability. Consequently, it implies that the reason of failure in getting the estimated benefits of downsizing is the lack of a premeditated approach of downsizing practice (Labib and Applebaum 1993). Following are some of the common strategies implemented by the organizations which undergo effective downsizing in relation to performance.

- Commands need to be implemented from top management with the recommendation of lower level managers and staff on the basis of analysis of job, tasks, and the way work is being organized.
- Both the short-term (reduction of human resources) and long-term (redesigning of the organization and systematic change in its culture) approaches need to be used along with the wide ranging and targeted downsizing.
- Proper attention should be paid to the needs of both the survivors and the laid off.
- The internal information system should be used to identify the specific points of redundancy and incompetence so as to target those areas.

## Implications for Managers

The current literature witnesses the downsizing of hundreds of organizations since its introduction within the organizational life. It also states several implications for the managers of downsized organizations or the ones having interest in it. Some are summarized as follows:

1. Organizations keep downsizing as long as their overhead cost is noncompetitive with the competitors at domestic and international levels.
2. Firms passing through hard times and high debt are more prone to undergo downsizing and reduce their workforce.
3. The companies that are not ready to downsize, usually begin without any policies for retaining and laying off. Consequently, they become unable to anticipate the subsequently developed problems related to work force.
4. The key indicators such as overhead ratios, revenues, profit on investments to stakeholders, and the prices of stock usually take 6 months to a year or more to develop.
5. The syndrome of survivors is a common outcome; the managers need to be prepared for it. Additionally, try to engage workforces in any planning activities in terms of downsizing efforts.
6. Identify the weakening of job security myth, and rise in the mobility of employees caused by downsizing. Downsizing has basically reformed the psychological contract terms which bind employees to their organization.
7. The operationalization remains unchanged which usually makes the productivity as well as quality to suffer. The same work load is put on the shoulders of the fewer retained employees which slows down the production and affects the quality.
8. In order to undergo effective downsizing, be ready to cope with apparent inconsistencies such as among the practice of top-down authority as well as bottom-top consent, among the interim strategies (reduction in headcount) and long-term strategies (such as redesigning of organizations and changes in their culture).
9. Bringing persistent expansions in production, quality, and efficacy incorporates decreases in headcounts with planned variations in the operationalization.
10. To look at downsizing as a process of persistent improvements and development, as it is not a one-time process of quick-fix solution to boost up competitiveness.

## Conclusion

Downsizing is a recent trend in the organizational life which boosts up performance and efficiency of the organizations by means of reducing the human and nonhuman resources. Despite of several issues caused by downsizing, there are various attributes, perspectives, and implications for managers discussed in this chapter which will be effectual for the organizations downsized earlier or interested to undergo downsizing.

# Due Process Rights

Amelie C. Simons
Northern Arizona University, Flagstaff, AZ, USA

## Synonyms

Constitutional rights; Fundamental rights; Judicial procedure; Life, liberty, property; Natural rights; Penumbra rights; Unenumerated rights

## Definition

Due process rights: A government guarantee that the fundamental rights of individuals are protected from unlawful infringement or deprivation through procedural safeguards.

Procedural due process rights: The constitutional promise of certain judicial procedures and safeguards to justify government deprivation of an individual's fundamental right to life, liberty, and property.
Substantive due process rights: The deprivation of an individual's fundamental guarantee to life, liberty, or property must be sufficiently justified according to the rights implied in the Fifth and Fourteenth Amendments.
Unenumerated rights: Additional rights that are inferred from explicit rights listed in the Constitution.

## Introduction

In the United States, the right to due process of law is considered to be one of the keystone rights guaranteed by the Constitution and enjoyed by "all persons." Due process rights broadly refer to the constitutional guarantee that individuals in the United States are protected, through legal safeguards, from arbitrary government infringement upon the rights which philosopher John Locke considered to be "natural rights": life, liberty, and property (Tuckness 2016). The right to due process is the only right that appears in the Constitution two times: in the Fifth Amendment and the Due Process Clause of the Fourteenth Amendment. Specifically, the Fifth Amendment protects the individual from *federal* government impingement on fundamental rights without first entering into the required legal procedures, or due process. The Due Process Clause of the Fourteenth Amendment extends due process safeguards to include individual protection from unlawful encroachment by *state* governments. The Due Process Clause also expands the breadth of the fundamental rights of individuals guaranteed by the constitution through the theory of substantive due process, discussed below.

The phrase "due process" indicates a concern with a protective procedure (Strauss 2016) or legal process (Gedicks 2009, p. 584). Formal due process rights, as well as many modern human rights, were first formally recognized in the Magna Carta, a British common law document from the early thirteenth century. The document has been credited as inspiration for many of the rights enshrined within the US Constitution and Declaration of Independence, as well as the 1948 Universal Declaration of Human Rights. The Magna Carta, or "Great Charter," is considered the originator of the normative idea of due process, which serves as a limit on government power for the protection of the individual (Gedicks 2009, pp. 596–598).

During and prior to the early thirteenth century, the monarchy held absolute power over the people (Turner 2014). In a reaction to what noblemen considered unfair taxation by King John, English barons resisted against the tax and, as part of the resistance, created the Magna Carta as a legal charter that declared their rights that were to be protected from infringement on the monarchy (ibid). King John placed his seal on the document in 1215, and in doing so formalized the list of 63 rights and liberties guaranteed to his noble subjects (ibid). One of the standout rights included in the Magna Carta, at least when looking at the relationship between the infamous British document to US laws, is the right to due process, described as the right to the legal procedures accorded in the "law of the land" in the Magna Carta. The phrase "law of the land" is significant in the US context because it provided the foundation for colonial law in British America. The "law of the land" persisted through the Revolutionary War and was adopted in the Constitution of the newly independent United States (Williams 2010, p. 435).

## John Locke: The Political Philosophy of Due Process

While the Magna Carta provided the foundation for the concept of citizen protection from unlawful government action, the idea of natural human rights to life, liberty, and property, as they are understood in the context of US law, comes from seventeenth-century political philosopher John Locke. Thomas Jefferson credited Locke as the inspiration for the rights described in the Declaration of Independence and the Constitution.

Although Locke was not the first philosopher to explore the concept of natural rights, as earlier philosophers like Hobbes and Grotius had written extensively on the subject, Locke's treatment of the right to property has set him apart from his predecessors (Tuckness 2016).

Locke's political works concerned both the concepts of natural law and natural rights; however, in a discussion of due process rights, it is the philosopher's work on natural *rights* that is most relevant. While the concept of natural law focuses on moral duty, natural rights refer to freedoms and privileges to which all people are entitled (ibid). Scholars disagree as to which is primary to Locke's philosophy – natural law or natural rights – yet there is a general consensus that the idea of consent was central to Locke's political philosophy (ibid), which laid the foundation for US due process rights. According to Locke, since humans exist in a state of nature without constraint from government or authority, it is only through consent that politics are created and societies formed (ibid). As such, it follows that since Locke's work is foundational to the Constitution, there would be constitutional safeguards and procedural measures to protect against unlawful government infringement on life, liberty, and property, as well as against the extension of government authority beyond lawful boundaries.

## Procedural Due Process Versus Substantive Due Process

The words of the Fifth Amendment and the Due Process Clause of the Fourteenth Amendments are succinct and abstract in their descriptions of due process rights. For example, the Fifth Amendment states, "No person shall be… deprived of life, liberty, or property without due process of law" (US Const. amend. V). Similarly, the Due Process Clause of the Fourteenth Amendment reads, "… nor shall any state deprive any person of life, liberty, or property, without due process of law" (US Const. amend XIV, sect. 1). Within the two mentions of due process in the Constitution, the term "due process" itself is not defined nor is a certain amount or type of due process specified. As such, it has been up to the Supreme Court to interpret the meaning of these early words and apply them to modern disputes between individuals and the government (O'Conkle 2006, p. 69). Through Supreme Court interpretation, two categories of due process rights have emerged to provide clarity to the topic: procedural due process and substantive due process.

Due process as mentioned in the Constitution lacks specificity and references only the judicial procedures required in the process. In the course of Supreme Court deliberations about due process over time, two types of due process have emerged: procedural due process, or the judicial proceedings that are necessary for the constitutional deprivation of an individual's life, liberty, or property, and substantive due process. Procedural due process, the less contentious of the two topics, asks the "how" question of due process: How does the government perform proper due process (Chemerinsky 1999, p. 1501). Some aspects of procedural due process, such as the right to trial by jury, are explicitly stated in the Bill of Rights, while others have developed as part of the legal process over time.

Substantive due process, on the other hand, is significantly more controversial in that the Supreme Court has never clearly defined the term in any of its decisions or opinions and also because justices in the past and present continue to disagree about whether substantive due process even exists (ibid). Put simply, substantive due process asks the more complex "why" question of due process: Why was the individual deprived of his or her fundamental right, and are the reasons sufficient to warrant the deprivation of a life, liberty, or property? While procedural due process concerns a simple question of procedure, substantive due process asks the more subjective, and understandably more difficult, question of whether or not the government was justified in prohibiting an individual from the full enjoyment of his or her natural rights. In other words, the term substantive requires the government to demonstrate convincing and substantial justification for denying an individual his or her fundamental rights (Chemerinsky, p. 1502). Substantive due process has been the underlying question to many of the most controversial Supreme Court

decisions, such as the right to sexual preference, to privacy, and to abortion.

## The Evolution of Due Process Rights in the United States

Since the ratification of the Constitution 1788, due process rights have evolved and been defined through decisions of the Supreme Court. Substantive due process rights, especially, have been shaped through oftentimes historic and controversial Supreme Court cases. It is the ongoing debate concerning the scope of substantive due process rights, inferred from the words of the Fifth and Fourteenth Amendments, which have truly underscored the continued philosophical, political, and legal debates on this topic. In 1791, when the Fifth Amendment was ratified, the scope of this amendment was generally understood to extend only to procedural due process (Williams 2010, p. 408). In other words, at the time of ratification, the Fifth Amendment simply guaranteed to the citizenry that certain judicial procedures would preempt the deprivation of life, liberty, or property.

Between the time after the ratification of the Fifth Amendment but before the ratification of the Fourteenth Amendment in 1868, the concept of substantive due process had already begun to emerge and was expanded through both state- and federal-level court cases covering due process disputes (ibid). One key case in the development of substantive due process from in the Fifth Amendment was *Zylstra v. Corporation of the City of Charleston* in (1794), in which Justice Thomas Waties's interpretation of the "law of the land" phrase (Williams 2010 p. 447) was broad enough to indicate the existence of substantive rights. Many historical and legal scholars adhere to the traditional view that it is clear in the initial interpretations of the Fifth Amendment during the late eighteenth and early nineteenth centuries that the due process rights prescribed in the Constitution were broad enough to allow the legislature almost unlimited discretion in the continued expansion of these rights (Williams 2010, p. 454).

During the period prior to the ratification of the Fourteenth Amendment, it is important to note slavery was legal in the United States, and the topic of due process was key in both sides of the abolition debate (Williams 2010, p. 408). Likely the most infamous case of due process rights in the context of slavery is *Dred Scott v. Sandford*(1857), in which the Supreme Court determined that the prohibition of slavery in the northern United States was a violation of the Due Process Clause of the Fifth Amendment. Specifically, Justice Taney's majority opinion states that the prohibition of slavery constituted an unlawful deprivation of property without due process of law, as Northern slave owners have not violated any existing laws and thus had been deprived of property without the appropriate judicial procedures. Although the *Dred Scott* decision stands as a remnant of a dark period in US history, it is still used to evidence both sides of the modern substantive due process debate. While critics of substantive due process see the case as representative of the controversial nature of substantive due process that has persisted for over a century, supporters of substantive due process cite the case as a further solidification of the historic existence of substantive due process (Williams 2010, pp. 468–469).

The Fourteenth Amendment was ratified in 1868 as part of the Reconstruction Amendments following the Civil War. By this time, the majority of state courts had issued decisions on due process cases that indicated an acceptance of the expansion of due process beyond simple procedural safeguards to encompass the idea of substantive rights (Williams 2010, pp. 469–470). Following the drafting of the Fourteenth Amendment in 1866 and the subsequent ratification in 1868, the first case in which the Supreme Court was asked to interpret the new amendment's Due Process Clause were the *Slaughter-House Cases* (1873). The decision in the *Slaughter-House Cases* denied the existence of implied substantive due process within the words of the Fourteenth Amendment. However, dissenting opinions in *Slaughter-House* and subsequent cases dealing with the due process rights of the

Fourteenth Amendment suggested that the majority of justices sitting on the Supreme Court did, in fact, support the notion of substantive due process rights in one form or another (Williams 2010, p. 488).

Following the *Slaughter-House Cases* (1873), due process rights in the context of the Fourteenth Amendment continued to be debated in the Supreme Court, and myriad specific rights were extrapolated over time from the Due Process Clause of this Reconstructionist amendment. In *Lochner v. New York* (1905), for example, the Court determined that the Due Process Clause covered the "right to contract." Later, in *Mapp v. Ohio* (1961), the Supreme Court incorporated the right to privacy from the Fourth Amendment to the states through the Due Process Clause. One of the most controversial substantive due process cases – *Griswold V. Connecticut* (1965) – again dealt with the right to privacy, arguably the key substantive due process right, although this time in the context of contraception, and set a key precedent for future due process rights cases in the development of the "penumbra" language.

In his majority decision in *Griswold*, Justice Douglas used the term "penumbra" to describe a protection of fundamental unenumerated rights derived from the Bill of Rights and applied to the states in the Fourteenth Amendment. In the context of the above cases, constitutional due process rights work two ways. First, as part of the *Griswold v. Connecticut* decision, the Court determined that Due Process Clause of the Fourteenth Amendment works to protect all fundamental rights, both those explicitly listed in the Bill of Rights and the unenumerated rights that fall within the penumbra of the Bill of Rights. In *Lawrence v. Texas* (2003), another infamous case covering the right to privacy in the context of sexual privacy, the Court overturned its previous ruling in *Bowers v. Hardwick* (1986) and determined that consensual sexual conduct, specifically homosexual conduct, was protected by substantive due process rights contained within the Fourteenth Amendment. In broadening the list of fundamental rights beyond those delineated in the Bill of Rights to extend to rights of contract, marriage, sexual preference, and others, the Supreme Court thus far has solidified the existence of substantive due process rights. In doing so, the Court extended the scope of due process rights beyond those delineated in the Bill of Rights, thus creating a flexible list of fundamental rights that is capable of adapting to the ever-changing needs of the American citizenry.

## Conclusion

Due process rights, both procedural and substantive, have a rich philosophical history in that began long before the United States was an independent nation. The centuries-old idea of due process requires a painstaking and never-ending process of refining and adaption as society and technology provide a constant stream of new questions for the Supreme Court. English common law from the thirteenth century established a basis for a historic and ongoing debate among philosophers, politicians, lawmakers, and the judicial branch as to the nature and extent of due process rights. Paralleling the academic debate about due process rights is an evolution of these rights in the United States that has broadened the scope of protection from government infringement over time. Whereas early constitutional due process rights were mostly procedural in nature and protected individuals from only the federal government, such rights have evolved, in the context of substantive due process, to extend to a myriad of unenumerated fundamental rights that are protected from unlawful state and federal government infringement. As the Supreme Court has set a precedent of the continued expansion of substantive due process and unenumerated rights, one can reasonably expect that the penumbra of substantive due process rights will continue to expand, while procedural due process rights will be further refined with the ceaseless advancement and globalization of American society and technology.

## Synonyms

Dynamic capabilities; Fiji; Operational capabilities; Public administration

## Definition

The dynamic capability view involves sensing opportunities and threats, seizing opportunities, and creating and maintaining competitiveness with reconfiguration. DCV helps explain how firms cope with changing environments.

## Introduction

For the past two decades, a key issue affecting both policy makers and analysts is the poor capability of public organizations (Pollitt and Boukaert 2011), thus leading to reforms (Andrews et al. 2016). However, empirical evidence proves that organizations either struggle with implementation or fail to realize any professed benefits (Piening 2011).

In public administration, the issue of organizational performance has become very important (Rainey 2003). While the issue of why some reforming enterprises perform well while others do not, attracts a lot of interest, literature still fails to provide convincing explanations behind this. Hence the importance of understanding this difference in performance and how poor performance can be resolved. It is implementation that is largely treated as the "black box" in existing research (Piening 2011). In addition, public management scholars have also paid little attention to the role and importance of resources (Fernandez and Rainey 2006).

The question guiding this entry is how do dynamic capabilities (DC) of (1) sensing opportunities and threats, (2) seizing of opportunities, and (3) creating and maintaining competitiveness with reconfiguration (operational capabilities (OCs)) improve performance of public sector when reformed and what are the outcomes? Specifically, this entry explores how public organizations develop, manage, and deploy DCs to renew their resource base when responding to the reform-related operational challenges. This entry suggests OC as the DC reconfiguration stage, the other two stages being the sensing and seizing stages described in a later section.

This entry adopted a qualitative comparative case study approach of seven public organizations, including better and poor performers of different industries. The DCV has attracted much attention in management literature (Barreto 2010) and "has become one of the leading frameworks . . . of long-term firm survival and growth" (Wilden et al. 2016, p. 997). Its key strength lies in explaining how firms cope with changing environments (Barreto 2010). This approach, however, "still lacks consensual concepts that allow comparisons of empirical studies and advance the theoretical understanding of dynamic capabilities" (Vogel and Güttel 2013, p. 427). This entry recommends a modified DCV version to investigate reform-related changes in public sector.

Despite conceptual limitations, DCV has the potential in organizing structures and enhances understanding of how organizations change their existing resource portfolios – DCV therefore does deserve further research effort (Peteraf et al. 2013). This entry is one of the very few studies in the public sector using the DCV approach and the first based on a smaller developing pacific island economy. The DCV is consistent with the key aim of this entry as it explores and describes organizational capabilities in changing circumstances. Literature confirms the extensive application of it, in strategic management but scant use in public administration where it also holds much potential. This entry also further addresses the call for research and findings that discuss high as well as low capability (O'Toole and Meier 2015) since this entry includes both better and poor performers. In addition, this entry also responds to calls made for capabilities that lead to better performances in a specific context (Williamson 2016).

The remaining section of this entry is structured as follows. The next section presents literature on DCV research. The following section discusses the methodology. The third section discusses the empirical findings. The entry then closes of with concluding remarks.

## Dynamic Capability View

DCV emerged in the 1990s and advanced considerably since then (Ambrosini and Bowman 2009). It has extended the resource-based view (RBV) argument of creating valuable, rare, preemptive, and imperfectly substitutable resources, refreshing the existing resources in "changing environments" (Ambrosini and Bowman 2009) since "the RBV does not explain how firms sustain competitive advantage in changing and uncertain environments" (Gnizy et al. 2014, p. 6).

Developing dynamic capabilities is no easy feat (Teece 2007), more so for the changing public organizations. Like Fischer et al. (2010) and Gebauer et al. (2012), the authors of this entry are of the view that success in any changing public organizations depends on DCs which "underpin operational capabilities" (Fischer et al. 2010, p. 593). In fact, relationship between capability

and relevant organizational attributes is particularly important to professional bureaucracies of public sector (Harvey et al. 2010).

When deploying DCs, organizations do come up with OC reconfigurations (Wilden et al. 2016). For instance, in their study, Gebauer et al. (2012, p. 329) discussed reconfigurations in terms of corporate culture, human resources (HR), organizational structures, and innovative process. This implies that "dynamic capability development is not simply about renewing one specific type of capability, but rather, it is a meta-capability to learn how to repeatedly renew the firm's overall capability" (Zeng et al. 2016, p. 1).

For this entry thus, the hypotheses are:

1. The sensing DCs enhance the performance of public organizations.
2. The seizing DCs enhance the performance of public organizations.
3. The reconfiguration DCs enhance the performance of public organizations.

The authors of this entry suggest OC as the DC reconfiguration stage. DCs enable organizations to modify their OCs. The following six OCs are identified as an integrated resource reconfiguration package: (1) HR, (2) organizational culture, (3) machines/facilities, (4) structures/routines/processes, (5) R&D – new products/portfolio – and (6) alliances/partnering/network. This is supportive of the argument of Wilden et al. (2016: 1030), which indicates that "the DCV revolves around how dynamic exchange systems integrate different types of resources in order to affect the operational capabilities and ultimately evolutionary fitness." In this entry, the "reconfiguration DC" reflects at the OCs which is in line with Gebauer et al.'s (2012, p. 329) point that reconfiguration continues with subsequent improvements in OCs.

1. ***HR***

   Apart from leadership, HRM is another important topic missing from the DCV research agenda (Vogel and Güttel 2013, p. 441). New capabilities are not only about infrastructure but also include managerial talent and skilled employees who are flexible enough to "adapt to new roles and work environments" (Zeng et al. 2016, p. 23).

2. ***Organizational Culture***

   A supportive organizational culture is required for the configuration of DCs and OCs (Wilden et al. 2016, p. 1036). Thus, "... building a collective learning culture to drive people's desire for change" is critical, but such changes require "a different mind-set'...and emotional connection among the firm's employees" (Zeng et al. 2016, p. 17). While organizational culture does affect corporate and individual behavior (Selznick 1996), little previous research has investigated the DC–organizational culture relationship.

3. ***Machines/Facilities***

   Property, plant, and equipment positively affect performance in terms of better work conditions and environment (Fry et al. 2004). Such hard investments are often required with new directions (Zeng et al. 2016) to keep pace with market developments. This may also mean upgrades to current technology, repairs and maintenance with what works, and divestment of what becomes more costly to maintain and no longer contributes to overall profitability (Zeng et al. 2016, p. 20).

4. ***Structures/Routines/Processes***

   Reevaluation of current strategy and envisaging possible changes become necessary for new strategic directions, but changes require "a different type of interaction between people and machines" for considerable impact on structure, routines, and processes (Zeng et al. 2016, p. 18). Routine then causes desirable changes in current operations (Hsu and Wang 2010, p. 8), and this "in the context of operational and DCs warrants some discussion" (Wilden et al. 2016, p. 1035). According to Ulrich and Lake (1991), the internal structures, processes, and conditions of organizations give rise to opportunities for unique competencies. In a public sector setting, however, structural complexity can either be positive or negative. In any case, "there is precious little evidence on the relationship between internal structural complexity and capability in either public

(or private) organizations" (Andrews et al. 2016, p. 253). Most importantly, structures affect an organization's ability to sense and seize opportunities as well as for OC reconfigurations (Wilden et al. 2016, p. 1036).

5. ***R&D – New Products/Portfolio***

   New capabilities are inclusive of R&D efforts (Zeng et al. 2016) which explain why organizations may differ in DCs when it comes to R&D capability (Helfat 1997). When DC accumulates ongoing R&D activities, there is control of key knowledge using which organizations are able to shape up proprietary research platforms for future success (Hsu and Wang 2010, p. 11).

6. ***Alliances/Partnering/Network***

   There is little discussion thus far on DC development on a system-wide basis (Zeng et al. 2016, p. 32), and while "research has reported at length on how inter-organizational networks can be effectively governed in public service delivery, . . . most research on public networks relies only on secondary data or one-shot surveys" (Berthod et al. 2017, pp. 1,5). The fact is that a well-connected network brings about greater benefits (Zeng et al. 2016) improving the chances of an alliance's success (Rothaermel and Deeds 2006).

The use of an integrated package of OCs as mentioned afore is not only wholesome and comprehensive with an in-depth study of seven cases but also contributes to literature on micro-foundation of capabilities and their evolution in a rapidly changing environment (Ambrosini and Bowman 2009; Teece 2007). To the best of the author's knowledge, these six OCs have not been studied together in DCV research. "Very little is actually known about what organizational attributes, or combinations of attributes, enable or restrict the emergence of high or low capability," and "to date, public management research has not focused on the ways in which capability is shaped by internal organizational contingencies" (Andrews et al. 2016, p. 241). There may be other factors that can be termed as OCs, but the authors of this entry chose to settle for the six above. These six may be easier to replicate in other public sector settings to validate claims of this entry. As per the key questions and in keeping consistency with the literature reviewed, the following conceptual model was developed, illustrating the relationship between the OCs through DCs and the performance of the reforming public sector (Fig. 1).

## Methodology

This entry utilizes an in-depth study, using interpretative multiple-case study approach. For the institutional case studies, qualitative research methods were used. This entry employed convenience and snowballing nonrandom sampling techniques, whereby individuals who were easiest to reach out to were interviewed first (convenience) and these interviewees recommended others who could be interviewed (snowballing).

For the exploratory research, a few interviews were conducted at Fiji's Ministry of Public Enterprises for background information on Government Commercial Companies (GCCs). GCCs are wholly government-owned corporatized enterprises that are required to operate purely on commercial objectives. Out of the 11 GCCs, 1 declined to participate and 3 failed to respond despite follow-ups. "Due to the sensitive nature and depth of the information sought, accessibility also influenced the selection of specific firms" (Zeng et al. 2016, p. 9). The authors of this entry thus ended up with seven case studies. Research was conducted between 2009 and mid-January 2017.

Piening's (2011) research, one of the very few studies using the DCV in a public sector setting, used a multiple-case study design to investigate five German public hospitals. Other DCV researchers like also used this approach to explore how firms deal with disruptions. Fischer et al. (2010) used an interpretative multiple-case study approach across a range of capital goods industries. Gebauer et al. (2012) also made use of an interpretative multiple-case study approach for DCs and operational capabilities in SMEs. Berthod et al. (2017) employed an explorative and interpretative case approach also to investigate into interorganizational networking. This entry thus also employs a multiple case-based

**Dynamic Capabilities in Public Enterprises, Fig. 1** The DCV in the context of the public sector

approach of seven public enterprises belonging to different sectors/industries in a different context – a smaller developing island nation unlike "much of the existing empirical research [that] has focused on investigating DCs at the business unit or corporate level of single-business firms" (Wilden et al. 2016, p. 1027).

"DCs operate over time and across levels, implying the need for multilevel longitudinal approaches to DCs" (Wilden et al. 2016, p. 1040). As such, this entry is based on longitudinal inductive data inquiry of seven companies reflecting better at the cumulativeness of DCs since reform efforts require time to fruition and public sector culture takes time to change (Narayan 2016).

The selection of the seven GCCs (four better performing and three poor performing) was ascertained during the first interview with a ministerial staff. These GCCs belong to different industries/sectors. The selected GCCs are (1) Airports Fiji Limited (AFL) (sector: transport and storage), (2) Post Fiji Limited (PFL) (information and communication), (3) Fiji Ports Corporation Limited (FPCL) (transport and storage), (4) Unit Trust of Fiji (Management) Limited (UTOF) (financial and insurance activities), (5) Food Processors (Fiji) Limited (FPFL) (agriculture), (6) Fiji Hardwood Corporation Limited (FHCL) (forestry and logging), and (7) Rewa Rice Limited (RRL) (agriculture). The authors of this entry selected these companies because they have a substantial history of providing public services and had been declared GCCs. These GCCs significantly differ in their performance

levels, allowing for effective comparisons. These GCCs can be placed into categories of better and poor performers given their ability to generate profits. GCCs that continue to report profits are AFL, FPCL, UTOF (except in 2009), and PFL (except in 2006 and 2010). While FPFL is able to generate profits (except in 2008), its profits are low. The GCCs that continue to report losses are RRL (except in 2008) and FHCL (except in 2010). AFL, FPCL, and UTOF remain better performers. PFL was a better financial performer since its inception, except in 2006. However, between 2010 and 2012, PFL's performance has been disappointing. The poor performing GCCs of FPFL, FHCL, and RRL particularly operate in losses or generate insignificant profits and are not in a position to pay any dividends to the government.

In collecting data, information was gathered from many sources enabling triangulation among different data sources (Eisenhardt 1989). Data was gathered through in-depth face-to-face interviews and relevant document search. The enterprise annual reports, cabinet decisions, legislation and parliamentary reports, and reputable magazines were examined to formulate certain enterprise-specific questions for interviews and to cross-check on interviewee responses.

Semi-structured face-to-face interviews were conducted with mostly senior-level staff as well as a few lower-level staff, similar to Zeng et al.'s (2016, p. 10) study. Senior ministerial staff served as key informants initially for each case study and together with senior managers of each study, facilitated site visits and interviews with key employees.

"Complete anonymity was promised in order to encourage the participants to give candid responses" (Zeng et al. 2016, p. 11). This promise of confidentiality and anonymity does not permit us to describe all data comprehensively or name/describe interviewees. This is also in line with research ethics.

The interview sessions were held for 45 min to 1 h 15 min in length, keeping in mind the respondents' time and concentration. Questions asked were about how GCCs carried out their functions prior reforms, how reforms were instituted, and what specific changes (with examples) were brought about during reforms. The interviewees were requested to detail their experiences related to reforms/changes. The questions in the interview questionnaire acted as guidelines to discourage divergence into irrelevant issues by interviewees. The authors of this entry deduced illustrations of DCs and OCs from data provided.

The collected data was analyzed on the basis of findings from the case studies in forms of responses from the interviewees and relevant documents which helped the authors of this entry document and explain findings. Substantive statements in each interview note and extra details (furnished during the interviews) were highlighted while repetitions, digressions, and irrelevant materials were put aside. Similar statements made by interviewees were noted as similarities and dissimilarities were marked. After going through all interview notes, the authors of this entry went back to these notes the second time to highlight substantive statements that might have been missed out in the first reading. Following this, the authors of this entry went through the collected primary documents to highlight noteworthy information. The authors of this entry then went back to the entire interview notes and documents to note the highlighted statements and categorized these as main events.

For validity and reliability reasons, statements were cross-referenced between interviewees' responses and documents such as company and ministry documents, published interviews in reputable magazines, and newspaper articles. The dissimilar statements were marked as queries, and after an interval of a few days, queries were clarified through quick repeat interviews, emails, or telephone inquiries. The interview data was supplemented by secondary data on background information from the ministry and various reports such as annual reports, corporate plans, and strategic plans in addition to prior scholarly research (theses, journal articles) on the case, as well as articles from reputable business magazines such as the review magazines, etc. Because the focus is on past as well as present achievements, chronological listings were created which were revised after sorting out queries.

Analysis began with a within-case analysis of each GCC to become familiar with each case as a stand-alone entity and to in turn accelerate the

cross-case comparison. The within-case analysis allowed the DCs to emerge before cross-case analysis (Eisenhardt 1989). The authors of this entry utilized a dynamic–comparative case study method for data collection and analysis, where dynamic means investigation of the past as well as contemporary capability-building processes based on actual events (Gebauer et al. 2012), while comparative suggests that a case is analyzed on its own first in terms of its strategic path leading to later cross-case analysis (Eisenhardt 1989). For the cross-case analysis, similarities and differences were noted in terms of the role of OCs and DCs.

## Findings and Discussion

The rich data from seven cases provide detailed information on how GCCs developed further overtime in terms of changes made to their resource base. The findings are presented in two phases: pre-reform and during reform. Because changes continue to be implemented, the authors of this entry cannot meaningfully discuss post reforms. The authors of this entry focus more on the second phase, adding OCs given that major changes were implemented in this phase. Detailed findings are presented in the supplementary materials.

### Airports Fiji Limited (AFL)

AFL was declared a GCC on 3 June 1998 and established as a result of reorganization of the Civil Aviation Authority of Fiji (CAAF). According to a senior long-serving staff:

> Even when CAAF was operating profitably, there were anomalies that are normally inherent in a public enterprise such as the laidback, lax work habits where drinking of 'grog' (national traditional drink made of powdered kava roots mixed in water) was a regular event. There were no proper controls and no accountability. CAAF was not really run like a business but was still generating profits because of its monopoly status.

### Fiji Ports Corporation Limited (FPCL)

FPCL was formally known as Ports Authority of Fiji (PAF). It was quite profitable since its inception until 1992 after which it began to struggle to meet its debt financing requirements following government's refusal to increase tariff (The Review 1993). A senior management staff mentioned:

> FPCL was established upon dual reforms. During the first phase of reforms, PAF was split into two enterprises – Maritime and Ports Authority of Fiji (MPAF) and Ports Terminal Limited (PTL).

However, even after first phase of reform, there were irregularities, leading to the second phase which saw the establishment of FPCL.

### Post Fiji Limited (PFL)

In its early days, Fiji's postal operation was a division of a government department – the Department of Posts and Telecommunications. Later in January 1990, it was corporatized as Fiji Posts and Telecommunications Limited (FPTL). Post Fiji was profitable, earning $680,000 profits in 1993, $691,000 in 1994, and $1.37 million in 1995 (Fiji Business 1996, p. 23).

### Unit Trust of Fiji (Management) Limited (UTOF)

Since its earlier days, UTOF was not doing too well until 2000, which led the government to decide on the closure or privatization of it, as per a top management staff. This staff expressed that:

> At that time UTOF was a small company. The size of its portfolio, amount of dividends and the number of unit holders were considered too low for operations, deemed unviable for the government. Full credit goes to the former GM for the turnaround of UTOF from a $15 million portfolio to about $90 million by 2008 which made the government change its decision. The former GM held parliamentary discussions and made ministerial presentations, explaining that there will be a turnaround and requested that the company not be divested.

### Food Processors (Fiji) Limited (FPFL)

Since 1984, FPFL operated under a joint venture partnership between Burns Philp (South Sea) Company Limited and National Marketing Authority (NMA) (Keith-Reid 1984). NMA was later renamed National Trading Corporation (NATCO). By 1986, FPFL was the biggest canned foods operation in Fiji but since the takeover of the defunct assets of Castle Trading Limited, was plagued with high costs. In 1992, FPFL was made

a subsidiary of NATCO (Appana 2003). In July 2003, it was declared a GCC when NATCO was liquidated. FPFL was reformed because its parent company could no longer sustain itself as its debts increased (Interview with a top management staff).

### Fiji Hardwood Corporation Limited (FHCL)

The Ministry of Forests was responsible for the development and maintenance of the mahogany plantations between the 1960s and 1997 (MPETC 2012). In the 1980s and 1990s, government realized that it was not good in commercial business. It then decided to reform its public enterprises (Interview with ministry staff). Accordingly, in 1996, a study was carried out to ascertain the viability of establishing a hardwood plantation corporation based on the successful transition of the softwood plantations. The study recommended corporatization (Food and Agriculture Organisation (FAO) 2002).

### Rewa Rice Limited (RRL)

RRL was established when the Colonial Sugar Refining Company Limited ceased its operations in the main island of Fiji. In its early days between the 1970s and early 1980s, the rice industry had people, power, and money to invest into infrastructure (Interview with a top management staff). The 1993 deregulation of the industry brought with it problems of competition.

## Reform Initiatives: DCs

1. ***Sensing***

   The worldwide political changes and stakeholder pressures compelled governments including Fiji to relook at their roles and to come up with alternative means for efficiency and effectiveness. As per the Department of Public Enterprises (1998), there was pressure from the late 1980s to reduce the role of the government. Appana (2003) mentions that, after the initial economic improvement post-independence in 1970, Fiji entered a recessionary phase in the 1980s facing weak economic growth, rising unemployment, and low investment levels. At this point, Fiji realized that it could no longer ignore the global trend and began to plan economic reforms and restructuring of the public sector.

2. ***Seizing***

   By 1989, the military in the absence of parliamentary opposition endorsed structural adjustments. The then government's structural adjustment policies centered on private sector led developments between 1996 and May 1999, giving the public sector restructuring much importance. The real breakthrough was the enactment of the Public Enterprises (PE) Act in 1996. Public Enterprises Unit (PEU) was later renamed the Ministry of Public Enterprise, Tourism and Communications (MPETC). As a result of the PE Act (1996), three types of public enterprises were created: Reorganization Enterprises, GCCs, and Commercial Statutory Authorities (CSAs). This entry focuses on GCCs which are more in number and more accessible.

   Hypotheses 1 and 2 are thus confirmed given that the (1) sensing and (2) seizing DCs gave rise to changes in public organizations for better performance.

3. ***Reconfiguration: (OCs)***

   "Data confidentiality does not allow us to describe all options comprehensively; the authors of this entry rather concentrate on the major content" (Gebauer et al. 2012, p. 614) in the following table. For hypothesis 3, some OCs are confirmed for some case studies only as discussed below (Table 1).

The proposed conceptual framework was empirically tested and is supportive of the empirical findings. A comparison of the results helped understand the following. For the public enterprises, the "sensing" and "seizing" DCs are explained collectively since government is the major decider. For instance, in terms of the DCs of sensing and seizing, FPFL and FHCL were in a way forced to or persuaded by the government to carry out reform initiatives given that they did not have any other choice. UTOF itself realized that such changes were needed. PFL and RRL abided by the change initiated by the government but

**Dynamic Capabilities in Public Enterprises, Table 1** DC stage 3: resource reconfiguration – the OCs

| OCs | HR | Organizational culture | Machines/facilities | Structures/routines/ processes | R&D – new products/ portfolio | Alliances/partnering/ network |
|---|---|---|---|---|---|---|
| **AFL** | Individual contracts, regular trainings, company-sponsored study | In early stages, faced staff outrage/resistance, employees had to accept change | Ongoing maintenance, repairs, upgrades, and installation of new systems, equipment purchase | Progressively lowered fuel prices | AFL Aviation Academy (AFLAA) made part of AFL; MOU with the Solomon Islands; new markets; increase in airline partners/new routes | Contracts with ex-staff and external parties like Singapore Airport consortium – Airbiz Limited |
| **PFL** | Better work conditions, regular trainings, company-sponsored study | Culture remains the biggest challenge, some employees improved, while some resist changes | Established new post offices, letter boxes, and postal agencies; improved mail services | Key performance indicators (KPIs); targets; voluntary redundancy scheme; upgrades, streamlining, modernization, automation, technological installations, and upgrades | Introduced products and expanded product range–diversification | Worked/works with DataMail NZ, DHL, Bank South Pacific, Digicel mobile company, Westpac Bank; participates in Asian-Pacific Postal Union (APPU) workshops; associates with student market; sponsors contests/ sporting activities |
| **FPCL** | Staff reapplications, individual contracts, flexibility, ongoing trainings | Culture change is a big problem; slight but slow improvements; some resistance | Purchase of plants and equipment; dredging, reclamation, renovation, upgrades, maintenance, demolition, refurbishment, seismic protection, extension works; new port of entry | Performance management system (PMS); IT projects; property management system; upgrades and computerization of financial and accounting networks; realignment of organizational structure and marine and stevedoring operations; assumed responsibility of all marine operations; shifted headquarters | Reclamation of land for later subdivision | Secretariat of Pacific Countries Ports Association (PCPA) – attends meetings and conferences; member of various committees; internal workshops with stakeholders; worked with ADB for wharf extension; has identified outsourcing of some cargo-handling activities |

| | | | | | | |
|---|---|---|---|---|---|---|
| **UTOF** | Few new positions, no redundancy, ongoing training | Small workforce – no major issues; some resistance/reservations on changes but resolved with clarification | Computerization | Improved awareness; proper management, analysis, and monitoring investments; focus on sales and marketing; reviewed standards and policies in accounting and HR aspects; new marketing plan; adopted Fiji Quality Award (FQA), FAS 39, and International Financial Reporting Standards (IFRS) | Invested across various sectors, engaged in projects; developed and implemented new investment products | Partnered with PFL and Vodafone, failed alliance with Baycorp |
| **FPFL** | Initial failed HR experiment, new appointments later, skill-based formal training, deployment strategy | Employee resistance, employment taken for granted | Old factory, inadequate storage, regular upgrades and technological replacements to machines and equipment, machine breakdowns still affect operations | Set measurable targets; rotation of process workers, implemented job descriptions (JDs), key result areas (KRAs), KPIs; staff training; Hazard Analysis of Critical Control Points (HACCP) plans; accreditation | Continues to develop products; several new products in testing stages – product range increased from 17 to 36 | Relies on local farmers but faces problems of quality, reliability, sustainability of produce and farmers reneging on contracts, expression of interest sought |
| **FHCL** | Same employees, later workforce fluctuations, manager-decided trainings, contracted senior staff | Culture transformation is a tough challenge; politics and landowners make it difficult to be commercial; new setup brought about job insecurity | Commenced with the sawmilling activity but without a proper system | Approved new mahogany policy; enacted Fiji Mahogany Act; established Fiji Mahogany Trust (FMT); new setup to benefit landowners | Extended its role: until 2002, forest grower/ manager; between 2002 and 2004, log supplier; from 2003 and in 2004, processor of sawn timber and semi-processed; and from January 2005, sawmill operator. Products are logs and rough and semi-processed sawn timber | In 1999, sought strategic partnership which made landowners uncomfortable; new proposal of 10% gifted to landowners; search for strategic partners difficult; new setup of new licensing regime allows for licensing partners; strategic partner desired for value-adding and downstream processing |

| OCs | HR | Organizational culture | Machines/facilities | Structures/routines/ processes | R&D – new products/ portfolio | Alliances/partnering/ network |
|---|---|---|---|---|---|---|
| **RRL** | Small workforce, no major changes – some laid off then re-employed on needs basis, occasional training | Few staff – no major issues | One mill, construction of new building; in early days, installation of mill machinery and equipment; now regular upgrades; renovated office; got rid of machines not generating income, and considering purchase of tillers, electronic dryer, new trucks | Improved payment procedure; improved accounting processes; reduced utility bills; ensures payment is received from farmers; assistance from the Ministry of Agriculture | Initially offered a range of grocery items to rural areas; core function to purchase and mill paddies but also sells by-product as manure; tried white rice idea but without success; expanded market Fiji-wide; embarked on awareness programs; relooking at packaging and export options, rebranding, rice flour option | Contract with Rice Company of Fiji for use RRL brand – contract expired in 2009 |

were also proactive in their approach on internal changes.

The results of this entry indicate that reforms/changes in public enterprises have not brought about improvements in all of them. To some extent, they have been successful in some resource reconfigurations, while in some cases, they are restrained by financial means. Because they are government owned, they do depend on it for major funding particularly those GCCs that are unable to report profits or report small gains. GCCs such as FPFL and FHCL remain plagued or have even worsened in performance. Their inability to generate profits and being constrained in the areas of investments in capital projects, relevant new technology or upgrades, equipment, and machinery are impeding factors which in turn affect profitability. This is also parallel to the argument of Vogel and Güttel (2013, p. 433) who mentioned that most of the researched materials report "the emerging tension between the building of new and the use of existing capabilities or, in broader terms, between stability and change." Since "technologies have matured in recent years" (Gebauer et al. 2012, p. 328), all GCCs have tried to improve their technological base; however for poor performers like FPFL, their efforts are reduced to continuous repairs and maintenance and small time upgrades unlike some of the radical changes instituted by the better performers. Given resource availability, the authors of this entry suggest that poor performers attempt incremental changes, while better performers embark on radical changes.

Nonetheless, the conducive factor of ongoing training and further education of employees is common across all cases. For example, changes to HR toward commercial orientation with performance-based techniques were a major change in all GCCs. This initiative concurs with the HR modification effort in Gebauer et al.'s (2012) study. However, in two GCCs – AFL and PFL – employees are only sponsored for further education if they take the initiative themselves by pursuing a few courses first. In RRL, training is occasional and at FHCL, decided by managers. In addition, like Gebauer et al.'s (2012) research, the cases in this entry made changes to accounting processes/systems to enhance speed in transactions as well as for generation of meaningful reports.

Notably FPFL, FHCL, and RRL are also dependent on their key resource providers or landowners such as fresh produce suppliers (FPFL), paddy suppliers (RRL), and mahogany landowners (FHCL). For RRL, recent changes such as better paddy price and pickup of paddy from their farms are motivating for farmers. The better performers such as AFL, PFL, FPCL, and UTOF have no such dependence and are, thus, not constrained in this area. In contrast AFL, PFL, FPCL, and UTOF are financially independent; are thus able to diversify and/or expand operations; upgrade or invest into relevant technology, equipment, and machinery; continuously engage in projects; are successful in attracting strategic partnerships; and hence are better performers.

In terms of alliance, partnering, and network, this entry shows that all GCCs joined hands with other companies which have an impact on company operations (PFL, FPCL, AFL, UTOF) or product saleability. This directly impacts performance (PFL, FPFL, RRL), a point similar to Zeng et al. (2016, p. 31) study that argue that "...firms need to compete collectively with their network partners against the networks of other companies." Empirical evidence suggests that certain GCCs like FPCL created learning relationship with other network partners for improvements by regularly attending workshops/conferences of associations it is a member of. This point is akin to Gebauer et al.'s (2012) findings.

What is also true is that in certain cases – as was the case in UTOF's Momi Bay project and AFL's contracting out to ex-staff – if organizations are not careful enough, then partnering can turn into a liability, adversely affecting performance. While partnering can be useful in enhancing operations through better technology and infrastructure, care should be taken on who the partners are. The Fiji Government has planned to further enhance the poor performers operations through strategic partnership. However, while FHCL has stirred up interest given its lucrative resource of mahogany, FPFL and RRL have not attracted much interest thus far. Such strategic

options are difficult for poor performers, which have a history of poor performance and age-old infrastructure. In the case of FHCL, the struggle between the landowners and the government did not allow such a partnership to eventuate for some time. However, it appears that the new approach of licensing may work.

While a common argument explaining the better financial performance of AFL and FPCL can be their monopoly status, what is also true is that their monopoly status could not prevent the drop in profits experienced in certain years, given the global crisis, coups in Fiji, coup-related negative publicity of Fiji overseas, and devaluation of Fiji dollar which increased the repayments of loans are borrowed from overseas. They are regulated monopolies that cannot increase tariffs or charges without government approval. This point on regulated monopolies needs to be further substantiated by future research.

All cases prove that culture appears to be a difficult OC to change. During transformations, commercial orientation was and is continuously promoted. This entry shows that when this new change met with the existing public sector culture in which most workers were instilled in, resistance was common. AFL, PFL, FPCL, FPFL, and FHCL indicated that changing work culture is far from easy and resistance to change is still common.

Culture is no doubt a major challenge. A fundamental realignment of it will take years to translate throughout the organization. Even after years of the change in status to a GCC, public sector work culture remains. The public enterprises spend time, effort, and funds on trainings, seminars, workshops, and further education to inculcate commercial orientation in all employees. Despite much effort, there are employees who have not shown improvements. Some managers expect a quick change, believing that the change in mind-set should or will take just a few years.

An additional factor worth mentioning and one that affects OCs of public enterprises are the incompatible and competing demands, which make unilateral conformity difficult, if not impossible – clash in political/commercial/social objectives expected to be fulfilled by GCCs. For instance, the 13 smaller airstrips on the outer islands are operated under the noncommercial obligation of AFL. AFL loses $3 million because of these loss-making operations annually given lower passenger and aircraft volumes.

Overall, this entry agrees with Hsu and Wang (2010, p. 18) who suggest that DC "be employed as a significant means of resource renewal and restoring capability diversity, as well as avoiding the inertia and simplicity that result from the scarcity of long-term efficient resource deployment within an organizational structure." While the authors of this entry agree with these authors, they further add that in the case of the public sector, the poor performers are vulnerable particularly those that have been reformed and are expected to fund resource reconfigurations on their own.

## Concluding Remarks

By empirically validating a theoretically derived model, this entry advances research in the area of DCV in the under-researched sector of the public sector. The suggested framework helps to better understand the DCV in the context of the public sector. This entry also sheds light on DCs in a smaller developing Pacific Island public sector which has not been given due consideration in many studies. The public sector practitioners, managers, as well as funding (donor) agencies may find this entry particularly meaningful when considering restructure/reform policies and budgetary allocations. A number of managerial implications can be drawn from the findings from the final table on OCs and discussion toward formulation of effective strategies.

However, since this entry is empirically based on just seven case studies and one country, external validity (generalizability) could not be assessed accurately. This entry should not be taken to exemplify the entire scenario of reforming public sectors. Nonetheless, publication of such research can result in replication elsewhere in different contexts, allowing for further research.

# Dynamic Relationship Between Sovereign Credit Market and Stock Market

Souhir Amri Amamou
Higher Institute of management of Tunis, Tunis, Tunisia

## Synonyms

Co-movement; Joint sensitivity

## Definition

The dynamic relationship between markets is defined as the joint sensitivity between markets that can explain co-movements, interdependencies, or the realization of a contagion phenomenon.

## Introduction

The investigation of the relations between financial markets is a subject of topicality much approached by researchers. In this regard, we refer to the studies of: Shahzad et al. (2016), (2017), and Fontana and Scheicher (2016).

In this context, previous researches have largely probed the crisis effect on the dynamic relations sensitivity between financial markets. We focus, on the level of this study, on the dynamics of the relationship between the sovereign credit market and the stock market.

In this regard, several studies have used the CDS market as a credit market representative. We quote, as references, the studies of Barath and Shumway (2008), Raunig and Scheicher (2009), Hammoudeh et al. (2013), and Paddrik et al. (2016) which found that the CDS could perfectly present the credit risk on the financial market.

Although several studies focused on the relationship between the CDS market and the stock market (especially bond market), as reported by Shahzad et al. (2016), few studies analyzed the effectiveness of the relationship study between the CDS market and the bond market in explaining the entire stock market developments.

We note that the significance of the relationship between the two markets premiums is a subject that has been discussed by previous studies and whose results show some convergence. Though, that the parity of the two premiums is still a matter to conflicting results.

In this way, some researchers notice that there is no difference between CDS spreads and those of sovereign bonds. In this regard, Duffie (1999) and Hull et al. (2004) considered this relationship a parity between bond spreads and CDS spreads in the absence of arbitrage opportunity.

Despite, other studies such as Longsatff et al. (2005) considered that there are significant differences between these two premiums. In this perspective, several studies essentially Fontana and Scheicher (2016), Carboni (2011), Palladini and Portes (2011), and Arce et al. (2013) analyzed the (CDS-Bond) basis. Moreover, Blanco et al. (2005), Bai and Collin-Dufresne (2013), Nashikkar et al. (2011), and Fontana (2010) used basis change in order to test the credit risk evolution in the financial market.

Fontana and Scheicher (2016) associated the base change outset to the financial crisis (2007–2008). Besides, they reported that this variation rises with the sovereign crisis explaining it by the shift in sensitivity between CDS premiums and bond premiums (in favor of CDS premiums) to the country specificities in terms of credit risk.

Despite the fact that many studies (Zhu (2006), Baba and Inada (2009), and Coudert and Gex (2010)) confirm the advance of the CDS market on the bond market during the crisis period and the non-parity between the spreads. Rare studies seek the impact of the (CDS-Bond) basis deviation of parity on the relationship between the credit market and the other markets such as the stock market.

It is in this spirit that we sought, at the level of this research, to detect the impact of the period of change in the (CDS-Bond) basis on the dynamic relationship between sovereign credit risk and the volatility of the euro area stock market.

## Data Descriptive Statistics

The neglect of developed countries by anterior studies favors the choice of our sample. According to Broto and Pérez Quiros (2015), Delatte et al. (2011) developed countries was neglected by previous researches for the benefit of emerging countries (Pan and Singleton (2008), Longstaff et al. (2011), Remonola et al. (2008)).

Then, this entry uses data for 10 developed Eurozone countries (Germany, Luxembourg, Austria, Finland, Netherlands, France, Belgium, Italy, Ireland, and Portugal) from 2010 to 2017. Given that the objective is to analyze how stock market react to (CDS-Bond) Basis change. Our variables are: (CDS-Bond) Basis and Vstoxx.

The composition of the (CDS-Bond) Basis is proposed in agreement with Fontana and Scheicher (2016) who defined it as the difference between CDS premiums and fixed coupon public bond spreads.

We note the development of a stream of studies focused on the analysis of the dynamic movements of credit spreads via CDS. We refer here to the work of Longsatff et al. (2005), Berndt et al. (2008), Raunig and Scheicher (2009), Zhang et al. (2009), and Hammoudeh et al.(2013). However, the market for sovereign CDS remains neglected in this regard since the analysis of the dynamics of their spreads remains relatively small in terms of the number of studies.

According to Olléon Assouan (2004) and Oehmke and Zawadowski (2015), the basis evolution analysis may well present a credit risk indicator. Generally, it is null considering the theoretical equality of the two premiums except that recent studies have found that it may well deviate from the zero value specifically when following the crisis periods. In line with Fontana and Scheicher (2016), we calculate the basis by using the difference between the CDS spreads and bond spreads. For CDS spreads, they are represented by the Sovereign CDS OTR S & P / ISDA Eurozone Developed Nation Index. Bond spreads are calculated by the difference between Bond yield and the risk-free benchmark (the rate of a 10-year German loan).

For *Vstoxx,* empirically, several previous studies have used stock indexes as an explanatory variable for credit spreads. We cite the example of the S & P 500 index to analyze the American market (Norden and Wagner 2008). In fact, our choice of this variable as euro zone representative fits with the previous studies of Fontana and Scheicher (2016).

Accordingly, data used in the study were collected from the following websites: www.investing.com and www.sandpindices.com. We select the 2010–2017 period because we are interested in assessing (CDS-Bond) Basis change in sovereign crisis period beginning in 2010 and postcrisis.

In order to distinguish the crisis period, we use the structural breaks test to detect regime changes over the studied period. Thus, we apply the Bai-Perron test allowing us to keep two break dates, namely the date of October 16, 2012, and that of August 1, 2016.

As follows, we devise our study period into three subperiods. Firstly, the first period is of significant gap between CDS and bond premiums (from March 22, 2010, to October 15, 2012). It is considered as a crisis period according to literature, which considers that the end of 2010 represented the peak of the sovereign crisis. This period is also characterized by the announcement of the highest public debt levels in the euro area (Boone et al. (2010)) and the positivity (CDS-Bond) Basis (Lahiani et al. (2016)). In the framework of our

study, we note the existence of a credit market imbalance presented by a deep gap between CDS premiums and bond premiums (Fig. 1).

Then, the second period is marked by a downward trend in the gap between the two premiums. It covers the period from October 16, 2012, to July 29, 2016. We choose to consider it a period of return to stability as the basis tends to return to parity. Nevertheless, this period turns out to be a phase of imbalance in the credit market such as its predecessor.

Finally, the third period covers the period from August 1, 2016, to September 29, 2017. It is considered stable as the basis has returned to parity as presented.

Based on the previously described data, we seek to detect the dynamic relationship between the (CDS-Bond) Basis and the variable Vstoxx by applying a ADCC-GJR-Garch (1.1) model. This step is followed by the detection of the dynamic correlation between the two variables. Finally, we seek to analyze the impact of the periodicity introduction on dynamic correlation of unconditional variance volatility (base, Vstoxx) a GJR-Garch (1.1) model.

## Results

Results show that both markets react significantly to internal shocks. At the same time, we note the persistence of shocks in these markets. Thus, both markets find it extremely difficult to get rid of shock effects during the studied period.

Similarly, we find that the symmetrical effects are statistically significant. As for asymmetric effects, they have a statistically significant impact. In addition, we note that the representative stock market variable (Vstoxx) has a significant sensitivity to negative information. This step allows to detect the dynamic correlation between the two variables.

We test at this level the effect of each period introduction on this relationship volatility between the two markets. We find that the volatility of dynamic correlations is significantly affected by internal shocks whatever the tested model is (Table 1).

Concerning the dynamic relationship between the two variables, it is significantly sensitive to internal shocks. In addition, the symmetrical and asymmetrical effects are significant although the symmetrical effect is dominant.

Similarly, we detect that the introduction of the first study period effect into our analysis has a positive as well as a significant impact on the volatility of the dynamic correlations between the basis and the Vstoxx variable.

At this level, we conclude that the introduction of the significant gap period between CDS and bond premiums affects significantly and also positively the volatility of the dynamic relationship between sovereign credit market and stock market. Thus, the crisis effect has a positive and

***: significance for 1%; **: significance for 5%; *: significance for 1% (Source: Author's calculation)

notable impact on the volatility of the joint relationship between the credit market and the stock market.

Furthermore, this result agrees with the results of the previous studies (Ayadi et al. (2006), Broto et Pérez-Quiros(2015)) considering that the crisis effect affects changes in the correlations between markets or financial assets.

Additionally, we find that the dynamic relationship is significantly sensitive to internal shocks. Likewise, we find that the second period introduction effect has a significant and negative impact on the volatility of the joint relationship between the two markets.

Added to that, we conclude that the return to stability substantially affects the volatility of the joint relationship between the credit market and the stock market although this effect is negative. Moreover, we find that the effect of introducing the third period is positive but not significant.

Finally, although the stability phase have a positive impact on joint relationship volatility between the credit market and the stock market, this impact is not significant unlike the two previous phases.

## Conclusions

The majority of previous studies related to the characteristics impact of the study period in the explanation of the dynamic relationship between markets are focusing on analyzing the crisis periods. Nonetheless, the period preceding a crisis can have an explanatory power of developments in dynamic movement between assets or financial markets. Hence, this entry investigates the explanatory power of crisis and postcrisis periods within the analysis of the relationship between credit market and stock market.

While a number of previous studies have considered that the crisis period is the most appropriate phase to examine the dynamic relation between financial markets, this research proposes a novel study focus by empirically testing the postcrisis periods effect.

Consistent results of periodicity impact are detailed on the explication of the dynamic relations between the sovereign credit market and the stock market.

Similarly, this research shows that the imbalance of the sovereign credit market presented by the gap between CDS and bond premiums considerably affects the volatility of the dynamic relationship between the sovereign credit market and the stock market.

Nevertheless, we emphasize that taking into account a structural break date is associated with a change in the study period impact sign on the dynamic relationship between the two markets. Thus, the latter reacts differently to both phases of crisis and return to stability although both of

them have many imbalance phases of public debt market.

However, the return to equilibrium presented by the return to parity condition does not significantly affect the volatility of the dynamic relationship between the two markets.

In short and contrarily to many other researches, we conclude that even if the postcrisis phase does not have the same explanatory power of volatility evolution between the two markets, it nevertheless presents a non-negligible impact, especially if associated with a financial framework. Thus, the analysis of this phase should not be underestimated as to its significant explanatory power.

In other words, these results allow us to confirm the importance of using crisis phase analysis in explaining the changes in dynamic relationships between these two financial markets. Likewise, we note the explanatory power of the other phases neglected by previous studies.

## Synonyms

Change; Improvement; Management innovation; Organizational change; Organizational innovation

## Definition

Managerial innovation may be defined as the adoption of management, organizational and operational methods, and modes that are new to an organization and that aim to improve organizational performance.

This text is a synthesis of an article published in Public Organization Review by the authors.

## Introduction

In the context of today's increasingly complex and constrained financial and budgetary environment, innovation is the primary means for improving the effectiveness and efficiency of public policies and, more generally, of the quality of public services (Favoreu et al. 2015). Following Rogers (2003), Lancer Julnes (2008), and Damanpour and Schneider (2008), innovation can be defined as the generation and adoption by an organization of new ideas and behaviors. Among the different types of innovation, public organizations in their vast majority resort to organizational and managerial innovations bearing on management techniques and modes of internal functioning and organization. If academic research today considers managerial innovation as a specific form of innovation with its own identity, the number of studies devoted to it are few compared to the volume of research on other types of innovation. Managerial innovation is addressed through its different forms and characteristics as well as its determinants.

## Definition and Characteristics of Managerial Innovation

Managerial innovation may be defined as the adoption of management, organizational and operational methods, and modes that are new to an organization and that aim to improve organizational performance. According to the interpretive approach, standards of newness are not absolute (they are not measured against identical referential frameworks) but instead are relative to a particular organization and its usual practices. Managerial innovation covers a wide range of objects that can nevertheless be grouped into two generic categories: innovations to do with organization and structure, and innovations to do with managerial techniques and processes. Managerial innovations can also be differentiated according to their intensity, defined as the impact of the innovation on the organization, on its dominant organizational paradigms, and its competencies. According to their intensity, they lead in varying degrees to a transformation of the organization, of

its resource management, and internal activities. By this criterion, one can distinguish comprehensive managerial innovations, which have a strong organizational impact, from incremental ones, which have relatively limited organizational impact. These two descriptive dimensions allow to distinguish the four forms of managerial innovation (See Table 1).

Managerial innovation as a practice and as an object of research faces a paradoxical situation in the public sector. Indeed, even though it represents an increasing share of public innovation, and despite its positive influence on organizational performance, it has long been considered secondary and remains relatively neglected by academic research. The great majority of research studies have concerned technological innovation related to processes or products, and most models, theories, and hypotheses have been developed on the basis of empirical studies focused on this one type of innovation. In both the public and private sectors, managerial innovations have usually been studied through the lens of technological innovation. However, to assume that theories and models derived from the study of technological innovation can be transposed to managerial innovation is problematic, all the more so in that numerous research studies have pointed out major differences between these two forms of innovation. Indeed, the tacit knowledge characteristic of managerial innovations, their lower transferability due to their identification with individuals, their systemic character (the ramifications of their influence on other organizational elements), and their impact on the organization's social system are all factors that make their diffusion and implementation much more complex than is the case for technological innovations. This is a key distinguishing characteristic of managerial innovations. Indeed, in contrast to technological innovations, where transformations mainly concern the technical system of the organization, managerial innovations go hand-in-hand with changes in internal operating methods and social interactions. By modifying hierarchical relations and decision-making procedures, they inevitably affect actors' zones of power and influence as well as internal balances and social arrangements. Moreover, by throwing into question not only the practices but also the values and representations associated with organizational routines, managerial innovations are liable to upset an organization's system of social norms and rules. This risk of conflict with the internal social system is all the greater in the public sector in that most managerial innovations are derived from the private sector or the principles of New Public Management; as such, they upset the public sector's traditional bureaucratic and hierarchical mode of management and the organizational behaviors and routines (stability, rules-based conformity, etc.) associated with it. Managerial innovations with a mainly private focus induce a transformation of the administrative organization's behaviors and values and of its modes of internal interaction (Bouckaert and Halligan 2008).

## Determinants of Managerial Innovation

Studying the determinants of managerial innovation implies analyzing the factors that influence it during the different phases of its development. Indeed, innovation is generally

**Dynamics of Managerial Innovation, Table 1** Typology of managerial innovations according to their nature and impact

| | | **Nature of the managerial innovation** | |
|---|---|---|---|
| | | Oriented toward structure/mode of organization | Oriented toward process and managerial tools |
| **Extent of change** | Includes all parts of the organization | **Comprehensive structural innovation** | **Comprehensive process innovation** |
| | Limited to specific parts of the organization | **Local structural innovation** | **Local process innovation** |

conceptualized as a multiphase process composed of four main stages: awareness, adoption, implementation, and institutionalization/routinization (Damanpour and Schneider 2006). Innovation can also be understood as a multidimensional phenomenon whose dynamics are influenced by a diversity of factors both internal and external to the organization. Research on antecedents to innovation generally considers three groups of factors: environmental and contextual; organizational; and intrinsic innovation characteristics. In the public sector, most studies have focused on the organizational or environmental determinants. Some studies, for example, have highlighted the positive influence on local governments' innovation decisions of environmental factors such as economic growth, population growth, the tax base, and the size of the community in which the organization is located. These studies draw on contingency theory, which considers innovation to be an adaptation of an organization's structures to changes in the environment. Innovation is thus seen as a response to change in terms of opportunities and constraints on development. Within the category of environmental factors, numerous studies, drawing on new institutional theory have focused on characterizing the influence of institutional pressures and the political context on innovation choices. Mimetic behavior and the quest for legitimacy are said to largely explain the dynamics of innovation in the public sector. A second group of studies focuses on the influence of a variety of organizational characteristics, including size, the nature of the structure (organic or mechanistic), communication, resources, intraorganizational relations, and integration. In this category of determinants, the role and characteristics of managers and political and administrative leaders has been studied in considerable depth, bringing to light the particular influence of each type of actor on the dynamics of innovation in public organizations. A third group of studies, growing in number as researchers become more active in this area, has focused on analyzing the influence of the perceived characteristics of innovation on its process of adoption and diffusion in the public sector. For example, some researches have highlighted the influence on the dynamics of innovation of factors such as the cost of innovation, its complexity, and its impact or relative advantage. The most recent research on the dynamics and processes of innovation address the theme of collaborative innovation and the role of actors and inter- and intraorganizational networks, as well as that of the link between public innovation and governance. Dubouloz and Mattelin Pierrard (2017) confirm the importance of internal factors in the dynamic of innovation and more specifically, the influence of the characteristics and attributes of managerial innovations. Even though these studies, then, individually or collectively, have addressed the main determinants of public innovation, they all suffer from a common weakness, namely, that each type of innovation is studied in isolation and any potential relation between one type and another is ignored (Damanpour and Aravind 2012). Thus, despite their theoretical and empirical contributions to the study of the determinants of public managerial innovation, they pay no attention to the mechanisms whereby innovations may influence each other (Damanpour 2014). Recent research, however, has brought to light the existence of potential relationships and interdependencies between different innovations in the same organization (whether these innovations are the same or different in type) (Battisti and Stoneman 2010). Nevertheless, empirical data and studies on the complementarity of innovations remain rare (Damanpour 2014). This integrative approach or evolutionary perspective (Torugsa and Arundel 2015) is advocated by, among others, Roberts and Amit (2003) and Damanpour (2014). It argues that innovations are neither mutually exclusive nor neutral relative to each other but, on the contrary, are linked by relations of mutual influence and therefore interdependent. The adoption of one type of innovation can facilitate or influence the adoption of other types of innovations (Torugsa and Arundel 2015). Even though these studies do not specifically address public managerial innovations, they nevertheless enable us to postulate two types of links between innovations.

## Dynamics of Managerial Innovation

A principle of reciprocal evolution or joint optimization between the social system (influenced by managerial innovation) and the technical system (determined by product innovation) can be put forward; with the evolution of one triggering a transformation of the other. Indeed, to be both efficient and effective, the development of new products and processes requires organizational change. The literature, on this point, is unanimous: managerial innovations are triggered by the technological innovations that precede them. Indeed, the former can be said to be at the service of the latter, facilitating their enactment and helping to realize their full potential (Damanpour 2014). This dependent relationship (considered by Damanpour to be reciprocal between technological innovations and managerial ones), which suggests a time dimension between the different types of innovation, has given rise to two main categories of temporal model: on one hand, the sequential model (Damanpour et al. 2009) and, on the other hand, the co-evolution model (Roberts and Amit 2003) also known as the synchronous innovation model. If the first model supposes a sequential character and causal relations between the different innovations, it does not put forward any hierarchy or order of subordination between them. Thus, according to Damanpour (2014), technological innovations could as readily be determinants as consequences of organizational innovations. The analysis of innovations at 85 public libraries (from which the sequential model is derived) has shown that changes in the social structure of the organization, changes that resulted from managerial innovations, can subsequently lead to technical and technological innovations. The second category of model (the co-evolution or synchronous innovation model) is, for its part, an expression of the quasi-simultaneous adoption of different types of innovation that are complementary. This complementarity concerns the implementation of innovations as much as it does their performance outcomes. This second type of model is derived from the analysis of technological innovations of the product type in the manufacturing sector. However, some studies show a combined use of technological and administrative innovations. The hypothesis of an indirect link between innovations is based on the notion of innovation capability and, more generally, on the concepts of organizational and dynamic capabilities. From this perspective, innovation promotes, over time, the development of greater innovation capability, defined as the aptitude to develop new ideas, products, and processes (Luo et al. 2005). It contributes to the establishment of new representations and behaviors (creativity, for example, or risk-taking) as well as interactions and learning that promote still greater innovation. Studies show that certain categories of public innovation, based on managerial autonomy, accountability, and results-based evaluation, foster the development of an innovation culture, a culture that in its turn goes on to promote better performance and new innovations. By producing new organizational knowledge and by modifying internal behaviors and representations, innovation positively influences the organization's innovation capability.

## Conclusion

Further research should focus on the characterization and analysis of the innovation learning process, identifying its individual and collective components. Organizational determinants such as the structuring of organizational memory (accumulation of innovative experiences), the weight of internal communication, human factors such as leadership style, and environmental factors such as institutional and mimetic isomorphism in reference to New Institutionalism can enrich the nature of the determinants. Managerial innovation represents both a promising research domain and a vector for improving and modernizing public action.

# Dynamics of the Social Construction of Reality in Light of Organizational Ethnography in an Iranian Public Organization

Seyed Hosein Kazemi
Department of Public Administration, Tarbiat Modares University, Tehran, Iran

D

## Synonyms

Constructionist approach; Social constructionism

## Definition

Cetina (1994) defined social constructionism as "a doctrine most suited to penetrate into the internal environment of domains that appear unitary and homogeneous – into the constitution of the factual, the real, the authoritative meaning. Constructionism holds reality not to be given but constructed; it sees the aggregate as composite, the uniform as heterogeneous, the smooth and even-surfaced as covering an internal structure."

## Introduction

As a part of a bigger ethnographic fieldwork, this entry shares my observations about a practice of downsizing in an Iranian public organization. Drawing on Schneider and Ingram's (1993) framework, I show how the different groups of the target population attempted to construct and promote contesting social realities to save themselves from the risk of being fired. To do so, firstly I will briefly describe my ethnographic work and the context in which I observed the practice. Then, through analysis of two key events – "managerial changes'' and "debating over deservedness" – I will show how the dynamics of constructing realities were activated by and manifested through discursive practices of the employees. Finally, by discussing the case of Mahdi, I will show how this

whole process of meaning-making led to the dismissal of good employees regardless of their performance.

## Social Constructionism

Social Constructionism (SC) is a well-established paradigm to study the dynamics of local and socially constructed realities of organizations. Like other major organizational paradigms, the implications of SC for organizational studies could be analyzed along with ontological, epistemological, and methodological aspects. From the ontological point of view, SC has moved away from the objectivist stance to a subjectivist one whereby the independent-assumed existence of objects substitutes with the socially constructed realities. As reflected in organizational studies, this linguistic turn has led to the substitution of the universal and "out-there" concept of "organization" to the multiplicity of "in-here" "organizations" and finally to the "organizing" as the processual phenomenon of interest to the field. From the epistemological point of view, SC has argued against intellectualism and representationalism in favor of interpretivism where the subject has not any advantaged remote access to the truth and any access to the reality is mediated by the language we use. Finally, methodologically speaking, contrary to the explanatory and value-free modes of positivistic research, SC has called for understanding and value-laden research where the positivistic separation between researcher and researched substitutes with an interactive and participative joint inquiry of "co-researchers." This methodological turn has paved the way to use of different qualitative methods such as ethnography, grounded theory, hermeneutics, and phenomenology, along with new ways of data gathering and analyzing such as participant observation, shadowing, and thematic analysis, in order to study the practices of organizing.

This way of doing constructionist research is consistent with the methodological field of "praxiography" (Bueger and Gadinger 2018), which is to record, describe, and to reconstruct (−graphy) the practice (praxis) as a phenomenon situated in time and space. Therefore, SC proponents in organizational studies do not aim to find the logic of organizing. Instead, they want to understand the "practices" involved in organizing as the practice is assumed to be the basic unit of analysis of social phenomena (Czarniawska 2014; Tsoukas 2000). In line with this, this entry utilizes a (reflexive) ethnography to understand the dynamics of social construction of organizational realities as manifested by a critical event (i.e., a downsizing). Consistent with the praxiography framework, this entry also does not use ethnography in the traditional sense. Instead, it adopts a broad notion of ethnography as a research process based on fieldwork using qualitative techniques but including engagement in the lives of those being studied over an extended period of time (Davies 2008) where the interest is not in culture but in practice as situated in time and space. Finally, it should be noted that choosing a critical event, i.e., a downsizing, as a specific situation to look at the practice of social construction, is due to the fact that such events can accelerate the practice.

## My Ethnographic Fieldwork

As a lasting pursuit to have a personal explanation for deviance behavior (Malle 2004), I arranged for an ethnographic fieldwork on how the deviance theory (Berger and Luckmann 1991) would be socially constructed in an Iranian public organization (Office, hereafter). It took me a couple of months of formal and informal negotiations until I got permission to do my covert observations. This was done through a personal and confidential agreement between me and JA who was the head of Office, which was an almost independent division of a large public organization (ORG, hereafter) at that time. Composed of four functional divisions, the ORG was responsible for coordinating and monitoring the national policies on the automotive industry.

Office was operating in a newer, well-equipped separate building about 1 km away from ORG's

old building where the other three divisions were located. It also had a partnership agreement with a private-sector entity (EX, hereafter) for financial support and recruitment. These advantages have made Office more powerful than the other divisions so that JA autonomous decisions usually bothered the other division managers. However, JA's control over financial resources and, more importantly, his close relationship with ORG's head (RO, hereafter) has kept him safe from their destructive actions.

Everything looked good when I entered Office in February 2017: performance figures were excellent, many developmental plans were on board, power fights between middle managers have just ended in favor of JA and his allies, and he was hiring more employees through EX, including myself and about ten others, all of whom he had suggested. JA sent me to his closest and powerful middle manager (SA, hereafter); under his supervision I worked as a seemingly normal employee until I left the field. Among Office's employees, who were mostly undergraduates, SA was an exception holding a MBA degree and was responsible for R&D.

## The Unexpected Resignation

About a year after I started my observations, we were all shocked by the unexpected resignation of RO who left the ORG with the intention of joining another public organization. Following his leaving, the lobbying activities and power struggles were ignited between the divisions' managers. Needless to say, lacking RO support, JA was a good target for retaliation. Predictably, other division managers manipulated the new head of ORG (SH, hereafter) against JA. Disappointed to retain his autonomous position, JA finally resigned (about 2 months after RO resignation). Before his resignation, however, and as an important factor that led to his resignation, he was forced by SH to downsize Office. This decision was an obvious measure to reduce autonomy and power of Office, which included a 50% layoff and complete relocation of activities to ORG's building. Who deserved to be fired?

## Typical Social Construction to the Target Employees

Imagine a "falling balloon" whose passengers have to throw out one person to rescue the rest and get high again. Who is the best choice? Maybe the heaviest. Following such a utilitarian reasoning, one might expect JA to dismiss individuals with the lowest performance records. Nonetheless, the reason for downsizing was not performance improvement or financial problems but a political maneuvering. Therefore, the analogy of "debating balloon" would be more insightful, implying passengers or employees should debate over the socially constructed reasons and realities why they should not be fired. In order to analyze these contesting social realities, I use Schneider and Ingram's (1993) framework on social construction of the target population (Table 1).

Office had mixed staff: the managerial minority who were hired by ORG and the non-managerial majority who were employed by EX (about 35 out of 50 employees). Almost all of the former group were middle managers who were hired on a life basis implying that they were more stable than Office's head. As a result, the introduction of a new head, which I observed three of them, was an opportunity for the middle managers to change the internal balance of power, depending on which of them could form a coalition with the new manager. Drawing on leader-member exchange theory (Dockery and Steiner 1990), these struggles would finally shape new "in-group" and "out-group" borders. For a new head of Office the "in-group" was usually composed of the allied middle managers, the internal advisers, and his trusted newcomers who can be classified as the typical advantaged groups of Office.

Once a group of middle managers gained the advantaged position, they strive to change the social construction of their rivals ("out-group"

**Dynamics of the Social Construction of Reality in Light of Organizational Ethnography in an Iranian Public Organization, Table 1** Social construction of Office's target population

Adapted from Schneider and Ingram 1993

peers) to deviants who deserve any negative consequences and should be considered responsible for any weakness or failure. However, in spite of being manipulated by the advantaged middle managers, the new head cannot easily dismiss these allegedly deviant constituents. The reason is that they also have their own power resources and connections and he needs their cooperation to run the Office. But whenever he wants to get closer to them, he will be hindered by his advantaged allies. On the other hand, the contenders ("our-group" middle managers) may also want to work with the new head, but they feel like fools as their cooperation would benefit the advantaged managers who take the credit. These reciprocal attempts to misrepresent the other group were reproduced in all organizational practices including the downsizing.

Apart from these two powerful groups of middle managers, other employees who did their job regardless of who the manager is and without taking part in the power struggles can be classified as dependents. This group was composed of low-level employees or managers as well as women and custodians. Ironically, they were accountable for much of the work which was done in Office.

Certainly, the deviants deserved to be fired regardless of the situation. Given this fact, therefore, the minimum requirement to stay in Office was not to be considered a deviant; all you needed were to keep appearances, have a normal (not even good) performance, and not cross the formal and informal redlines.

## Social Construction to Make a Safe Position

Although advantaged and contenders were immune from layoffs, the story was totally different for dependents, which resulted in different reactions on the part of them. The first group to react was some of the advantaged non-managers and dependents who were brought by JA or other ORG's powerful persons to Office. They were well aware that by RO's resignation and imminent resignation of JA they would surely get laid off. As a result, voluntary resignation by those who were able to find another job somewhere else was the first reaction. Metaphorically speaking, they withdrew from the contest. I also resigned voluntarily as I felt, as a researcher, that I had taken the place of a more deserved person. Nonetheless, my resignation was not accepted as SA wanted to keep all of our five subordinates and he succeeded.

Among remaining employees, the advantaged middle managers and contenders were immune but had an important role in determining who should be picked out. Considering this fact, JA held several meetings with his middle managers, either contenders or advantaged, firstly, to gain their support for his final list and secondly, because he knew full well that he could not fire those individuals (almost dependents) these managers wanted to keep. Therefore, he had to keep the balance between advantaged and contenders.

Given the middle managers' key role in determining the final candidates, subordinates

(dependents) concentrated their rhetoric measures to convince them that they should not be fired as there are other groups who deserve more. First, they used their rhetoric to notice that there are too many old people working in Office without any economic reason to work: "They should leave public organizations in favor of young unemployed people. They do not know anything about new organizational know-how or computer skills." In contrast, the elders were trying to leverage their "valuable" experiences and connections but their social construction was not high enough to keep them safe.

Second, rhetoric efforts were targeted at singles and women: "I'm married. I have children to support ... it is not fair. I'm the breadwinner. There are some single men and women here who are younger than us. They could find a job in other places ... even if they couldn't, they could afford their single life costs." Married women were also targeted: "they are not the breadwinner for their family. Their husbands are responsible for that ... firing them has lower ethical and economical costs than us." Successful again, they saved themselves by pushing the single and women peers forward.

The eventually fired employees were mainly from weaker middle managers' units. Advantaged middle managers and contenders had the lowest number of layoffs including our unit with zero candidates on the list. Almost all of the laid-off individuals were the dependents: married women, elders, single women, and single men. The mission was completed thereby the total size of Office reduced from 50 to about 25 persons.

## Conclusion: Mahdi As a Case

Mahdi, a young single man who was in the third decade of life, was unanimously one of the most punctual, hard-worker, and good custodians. Office had six service employees; three drivers, and three for services like security and janitorial who all worked under the supervision of a not so powerful EX-hired manager (AM, hereafter).

AM was and is a close friend of mine. He always admired Mahdi's hard work, politeness, shyness, and his strong religious beliefs. In addition, Mahdi was a versatile employee who was always ready to do AM's orders without any complaining. On the flip side, AM was upset with at least three of his subordinates who believed they were "irresponsible and waiting for an opportunity to escape work." Even he was known of their minor wrongdoings, thus, sometimes called them "thieves" in our personal talks. In contrast, he always used the words of "integrity and honesty" for Mahdi.

Drawing on Clinard and Meier (2011), Mahdi was "different" (even "deviant") from a statistical viewpoint. He was different because he never smoked, he never lied, he never shirk his duties, he never said no to his boss, he never lifted something, he never had "gaze" on women, he never tried to make connections, he never advertised for his works. He was like an innocent child who did not know anything about going bad either in personal or organizational life.

AM, as a middle manager, had not enough power to keep Mahdi and finally he showed the door to him reluctantly; and the never-complaining Mahdi said "as you want" like ever. He was a young single man and his social construction was not so high to be safe from the layoff flood; there were other smoking, shirking, and not good but married and grown (and "normal" by statistical definition) men who deserved to stay!

I can never forget Mahdi. He was different but not deviant. He had positive and different traits that we admire when we find them in a friend, a child, a parent, or a citizen; but Office needed more "clever" men who know how to lie sometimes, how to advertise their deeds, how to keep their mouths shut, how to make connections, how to gain more power, and how to socially construct an image of deservedness and competency.

### Synonyms

Business-like practices; Commercial revenue; Commercialization

### Definition

Cause-related marketing: a relationship between a nonprofit and a business that aims to achieve predefined corporate and marketing objectives with financial or other types of benefits going to the nonprofit or a cause.

Licensing agreement: is a contract between a corporation and a nonprofit organization that allows a sponsoring corporation to use a nonprofit's name and logo in order to promote the corporation's products or services.

Sponsorship: a corporate sponsor pays a fee in exchange for the right to display its brand and logo in the nonprofit organization's programs, products, or other means of communications.

### Introduction

The nonprofit sector has become increasingly commercialized and there are multiple factors that explain such change. First and foremost, the demand for nonprofit services has been on rise in many areas, including but not limited to arts and culture, education, human services, and health care, which resulted in the growth of the nonprofit sector. For example, the growing population of older adults has increased the demand for nursing homes, home healthcare, and other types of elderly care services. Similarly, the growth of the female labor force in the second half of the twentieth century led to a greater demand for childcare services. Yet, the growth of the nonprofit sector resulted in greater competition among individual organizations for limited resources; thus, nonprofits started facing pressure to expand their earned income sources.

In the US, the stagnant growth in charitable giving and the decline in government support in the early 1980s also caused nonprofits to experience significant fiscal pressure and seek ways to increase their earned revenues. The expansion of consumer-side subsidies such as vouchers and tax credits, rather than traditional producer-side subsidies for nonprofits, encouraged for-profit companies to enter the field with their more plentiful capital, further complicating the competition for consumers relying on services using subsidies.

Earned revenue takes a substantial portion of nonprofit revenue. Indeed, earned revenue account for more than half of revenue in the nonprofit sector in many countries. Moreover, nonprofit organizations are increasingly forming partnerships with corporations through collaborative projects, cause-related marketing, and many other related activities. Below, we describe various ways nonprofits generate earned revenues as part of their effort to be self-sustainable.

## Partnerships

Through nonprofit-corporate partnerships, corporations give resources to nonprofit organizations with the expectation that corporations would receive direct and measurable benefits in return. As the definition entails, a partnership is a quid pro quo agreement that involves the exchange of resources for services. Thus, corporate giving and volunteering, although sometimes loosely referred to as partnerships, do not qualify as partnerships.

Nonprofit-corporate partnerships have become popular over the last few decades and are viewed by more and more scholars and practitioners as a necessary means to address increasingly complex social, economic, and environmental problems. According to the Corporate-NGO Partnerships Barometer survey (2017), the vast majority of UK-based companies and NGOs anticipate that nonprofit-corporate partnerships will become even more important in the future. The same survey also reveals that the need of nonprofits for funding and the desire of corporations for reputation and credibility are the primary motivations for cross-sector partnerships.

To collaborate successfully, partners must be connected through a shared purpose, which requires a high level of interaction between and within partner organizations and strong interpersonal bonds.

Partners should also share a mutual understanding and clarity about the purpose of the collaboration, which can be facilitated by writing collaboration purpose statements. Partners should also be in congruence with the mission, strategy, and values that allow them to establish a shared vision for the collaborative work. Communication between partners is the key for the success of a collaboration. Therefore, partners need to maintain high levels of respect and trust, keep channels of communication open, and provide constructive feedback to each other. Relatedly, partners should have a coordinated external communication strategy that advances the goals of the collaboration and help publicize it. Each partner should continuously learn about how to work effectively with another organization. Thus, learning should be established as an ongoing condition of the collaboration and regularly evaluated through a formal process. Lastly, partners should demonstrate a high level of personal, financial, institutional commitment to the collaboration while maintaining realistic expectations for each other.

### Sponsorships

In a nonprofit-corporate sponsorship, a corporate sponsor pays a fee in exchange for the right to display its brand and logo in the nonprofit organization's programs, products, or other means of communications. Corporate-nonprofit sponsorships can take many forms including facility-based sponsorship or program-based sponsorship. For instance, selling naming rights is a popular way of using facility-based sponsorships. Having business logos appear on theater programs, is one of the typical program-based sponsorships. A recent report (IEG Sponsorship Report 2018) reveals that companies all over the world allocated almost 63 billion to sponsorship in 2017. In the same year, North American companies alone spent $23.1 billion on sponsorships. Of those, sports sponsorships accounted for slightly more than 70%, followed by entertainment (10%), causes (9%), and arts (4%). Although some scholars view sponsorships as a type of strategic philanthropy, others argue that sponsorships are intrinsically motivated by various commercial incentives such as promoting brand names and increasing sales.

### Licensing Agreements

A licensing agreement between a corporation and a nonprofit organization is a contract that allows a

sponsoring corporation to use a nonprofit's name and logo in order to promote the corporation's products or services. In a typical licensing agreement, a corporation intends to gain favorable publicity by associating its products or services with a nonprofit as well as the cause that the nonprofit espouses. For corporations, the ultimate goal is to boost sales by paying for positive images associated with nonprofits. Nonprofits, on the other hand, intend to leverage their brand equities to generate a stream of revenues.

Licensing agreements can sometimes be controversial and may even pose a threat to nonprofit organizations if not done carefully. A classic example is the American Medical Association's (AMA) agreement with Sunbeam Corporation through which Sunbeam Corporation displayed AMA's logo on its medical products. The agreement gave the false impression that AMA endorsed the effectiveness of Sunbeam products. To avoid potential controversies, nonprofits should be cautious about the details of the agreement and be specific about what can be disclosed or cannot be advertised. Nonprofits must also be careful in choosing their licensing partners, especially in terms of overlapping values between corporate products and nonprofit services. From the consumer law perspective, a group of state Attorneys General offer the following advice. First, the compensation terms and agreements for the nonprofit-corporate partnership must make it clear if the nonprofit's name and logo would be used for commercial advertisements. Second, commercial advertisements that use a nonprofit's name and logo must not imply that the product or service is endorsed or tested by the nonprofit unless the organization can provide sufficient evidence to support the claim.

### Cause-Related Marketing

Cause-related marketing (CM), also known as transaction-based promotions, refers to a relationship between a nonprofit and a business that aims to achieve predefined corporate and marketing objectives with financial or other types of benefits going to the nonprofit or a cause. A classic example of CM is the American Express campaign, which was initiated to support the restoration of the Statue of Liberty. American Express pledged to contribute one cent to the Statue of Liberty-Ellis Island Foundation for every card transaction and one dollar for the issuance of every new card during the last quarter of 1983. The campaign resulted in a $1.7 million contribution to the renovation project and a 28% increase in American Express card usage. Today, there are multiple variants of CM. For instance, except for the "donation with purchase" model described above, businesses such as TOMS, Soapbox Soaps, and Smile Squared employ the "buy-one give-one" model, which donates a product of their own for each one sold. Disney's "Give a Day, Get a Disney Day" campaign represents another variation of CM, which aims to promote volunteerism.

A study conducted by Cone Communications in 2010 showed that 88% of the American consumers said that it is acceptable for companies to include a social cause in their marketing. The same study also found that 85% of the respondents reported that the image of a product or a company was improved when they supported a social cause that consumers cared about. When offered comparable products, 80% of the respondents said that they were willing to switch to a company with a social cause; 61% of them were likely to try a new product; and 19% consumers were willing to buy from a more expensive brand with a cause. Another study found that 72% of the respondents across 16 countries were willing to promote a product connected to a social cause.

Compared to traditional corporate philanthropic donations, CM has the advantage of allowing consumers to be directly engaged with a corporation. The same study (Cone Communications 2010) revealed that when individuals were given a choice between two companies with similar products and social causes, 53% of the surveyed respondents preferred the one that linked a purchase to a donation, thereby providing them with a chance to make an impact. Buying is a type of active engagement, and when connected to a social cause, it extends value creation to consumers and establishes a more meaningful consumer-company relationship (Austin and Seitanidi 2012).

## Business Ventures

For a nonprofit, whether to pursue a business venture that generates commercial income is a strategic decision that should be evaluated meticulously, particularly with regard to mission relatedness, operating environment, risks, and feasibility. Nonprofit's mission serves to justify its raison d'etre, determine its priorities, set its ultimate goals, and guide its activities. As such, any nonprofit that would like to initiate a fee-based program must consider how and in what ways the program relates to its mission.

Scholars (Wei-Skillern et al. 2007) suggest that nonprofit managers can use mission alignment and economic contribution to untangle this complex issue of determining whether to keep, nurture, or kill a business venture. Wei-Skillern and her colleagues (2007) divide nonprofit earned income activities into four categories based on how well a program is aligned with the mission and the extent it yields economic returns. The ideal program type is called "integral" which reflects high mission alignment and yields high economic gains. A "supplementary" program is one that has high mission relevance but do not bring significant economic contributions. When a program is not highly aligned with the mission but generates substantial revenue, it is called a "sustaining" program. Managers must look for ways to either improve the financial returns of "supplementary" programs or deliver mission benefits in a more cost-efficient fashion (Wei-Skillern et al. 2007). For "sustaining" programs, however, nonprofit managers should think about if they may distract from the organization's mission in the long run in that they have to weigh the nonalignment cost against the amount of money generated. Finally, nonprofit managers should consider eliminating "disposable" programs that are neither mission relevant nor economically successful. Although creating and nurturing only "integral" programs are desired, given the nature of diverse missions, it is oftentimes unrealistic. A more viable approach would be to have "sustaining" programs cross-subsidize "supplementary" programs to achieve core mission mandates.

Leaders of nonprofit organizations must also consider legal mandates and general norms when starting business ventures. In the USA, there are largely two legal constraints related to running commercial programs. First, organizations should uphold the section 501(c)(3) Internal Revenue Service (IRS) regulations. That is, an "organization must be organized and operated exclusively for exempt purposes set forth in section 501(c)(3), and none of its earnings may inure to any private shareholder or individual" (IRS n.d.). The word "exclusively" in the statute, however, is interpreted to mean "primarily" rather than "entirely" according to IRS regulations. To put it another way, nonprofits should make sure that their organizations do not focus primarily on commercial activities that are unrelated to their charitable purposes.

Second, nonprofit organizations have to pay Unrelated Business Income Tax (UBIT) on their income if (a) it is from a "trade or business" activity; (b) the activity is "regularly carried on"; and (c) the activity is not "substantially related" to a nonprofit's mission related tax-exempt purpose. UBIT aims to eliminate unfair competition between for-profit ventures and nonprofit ventures. According to the Internal Revenue Code §513, there are certain commercial activities that are exempt from UBIT.

Commercial businesses carried out by mostly volunteers and use donated merchandises are exempt from paying UBIT. Programs and services that are offered for the convenience of their constituents and members are also exempted from paying UBIT. Examples include hospital restaurants or paid parking garages for a youth sports center. Qualified public entertainment activities, trade shows, and convenient activities are other exempted areas. Corporate sponsorship fees, membership dues, federal instrumentalities created in accordance with an act of Congress and certain bingo game revenues are exempt from being subject to UBIT. Leaders of nonprofit organizations located outside of the U.S. should understand relevant local laws and regulations prior to initiating commercial programs.

Leaders of nonprofit organizations need to be also wary of social and individual expectations. The normative environments can differ across

organizations depending on their mission, location, and constituencies. That is, two nonprofit organizations initiating the same commercial business may face different reactions from their own communities. While the same commercial activity is embraced as appropriate in one community, it may be subject to criticism for commercialization in another community.

### Organizational Capacity for Business Ventures

Building a shared sense of mission among leaders, staff, and relevant stakeholders is critical to the success of a venture because a new venture often requires long-term and continuous input of money and time. Sufficient research and planning could take up to a year or even longer for the venture to reach financial sustainability. Yet, even after successfully launching a venture, nonprofit organizations must provide continuous attention and proactive management, responding to changes in the needs and the market conditions.

It is also critical for key staff to possess the adequate knowledge, expertise, and vision of the planned venture. These staff can help the organization make sound decisions on whether to pursue the opportunity based on their understanding of the market condition. Finally, organization's financial condition also plays a pivotal role in deciding whether the organization should launch a business venture. As aforementioned, a business venture is likely to be a long-term commitment that requires continuous financial inputs. Especially at the early stage of the venture, there are a number of fixed costs that organizations must pay such as rent or purchasing equipment. Therefore, it is generally not a good idea to launch a business venture without having spent enough time to plan ahead and certainly not as a way to fix deficits. If a nonprofit organization is already struggling with deficits, it is unlikely that the organization can spend on upfront fixed costs as well as spare the personnel needed for the venture to get started.

### Market Research for Business Ventures

Once a nonprofit organization decides to launch a business venture, it must determine whether there is enough demand for the product or service. Primary research, including surveying potential customers and focus groups, and secondary research, such as reviewing government and industry reports, can inform organizations about potential consumer behavior and demographics as well as the prices of existing goods or services. Based on the market research information and the strengths of a nonprofit, the organization can formulate a targeting strategy.

With the market research, organizations must try to understand various broad market forces and their influence on the proposed venture. Porter (2008) identifies five forces that shape industry competition, which entrepreneurs should be mindful of before entering a business in his article "The Five Competitive Forces That Shape Strategy." Here we define the five forces that are most relevant to nonprofit ventures: barriers to entry, dominant suppliers, powerful buyers, the threat of substitutes, and competitive intensity.

First, as a sector with limited access to capital, any business opportunity that requires large capital investments can deter many likely entrants. Nonprofit entrepreneurs should also consider if incumbents have cost or quality advantages over new entrants. These advantages may derive from the exclusive access that incumbents have to raw materials, established reputations, and unique geographical locations. Second, dominant suppliers that have control over prices can squeeze profits out of industry participants. Therefore, it is critical to ask if these influential suppliers restrain the organization's ability to produce products or deliver services. Third, a few powerful buyers in the market may possess the bargaining power that can force down prices or even drive up costs by requesting higher quality products or services. Fourth, in a market with many substitutes, customers can pay only minimal costs when switching between providers. A typical example is the generic drug market. Such markets often suffer from low-profit potential, and businesses that fail to differentiate themselves from similar products and services will be particularly vulnerable and have limited growth potential. Finally, competition can be more intensified if there are a lot of rivals with similar market shares, market growth is stagnant, and low-

performing organizations remain in the market due to high exit barriers.

## Conclusion

In the face of stagnant growth of government support and charitable giving, many nonprofits started exploring potential commercial opportunities to sustain themselves. This entry introduced two typical types of commercial activities – partnerships and business ventures. Nonprofit-corporate partnerships, in essence, is built based on an exchange. Nonprofits leverage their most precious capital, reputational assets, in exchange for additional revenue. As such, nonprofits interested in forming partnerships with businesses should carefully examine the end purpose of a potential partnership and be mindful of the value congruency between the two parties. A healthy and successful partnership should not only bring the revenue but also offer an additional means to advance the mission through the publicity.

Business venture represents another approach to derive commercial revenue. Compared to partnerships, business ventures require more planning, expertise, and capital. Therefore, it must be handled with extra prudence. First of all, any nonprofit considering to launch a new business venture must make sure it will not risk its legal status, and it conforms to the norms in their community. In addition, the planning team must evaluate the extent to which the organization is committed to the proposed venture in terms of management capacity, availability of funds, and more. Equally important is the market research. The planning team must understand the demand and the competition of the market before launching a new commercial venture. Even after all the planning, success is not guaranteed. Nonprofits should have contingency plans and whether and how they can tolerate unintended negative consequences.

# Economic Context of Public Procurement

Christopher L. Atkinson
University of West Florida, Pensacola, FL, USA

## Synonyms

Best possible quality and price; Collusion and price-fixing; Externalities; Keynesianism; Market failure; Privatization

## Definition

The economic context of public procurement involves the interaction of government ideals, laws, and regulations with the private sector and

its market processes, and the consequent opportunities and challenges of this operating environment for achievement of public goals. Questions about equity, costs, and the impact of economic pressures feature in such discussions (Callender and Matthews 2009).

## Introduction

Because outlay of public resources for goods and services by government forms a considerable share of spending in a nation, inefficiency in purchasing operations is concerning for the public sector generally, and specifically for those that work in procurement functions. Inefficiency in the purchase of goods and services for public needs not only undermines short-run savings on purchases but also undercuts the potential for government resources to be used wisely to achieve greater returns for the public (Gori et al. 2017).

Public procurement intersects with economics in a number of important respects. In basic terms, public spending must be controlled and efficiencies increased. At the same time, public purchasing occurs in an environment where favoritism is possible, or where emergencies can force processes to deviate significantly from those prescribed for maximizing benefit and keeping costs low. Both situations might result in suboptimal outcomes and waste of public resources. The "how" of procurement – with decisions like solicitation, contract type, and mode of procurement – can also impact outcomes realized significantly (SIGMA 2016). As public procurement professionals seek optimal outcomes and reduced costs, risks and externalities must be managed. This entry looks at the economic considerations in public procurement, market failure, and price fixing and collusion.

## Economic Considerations in Public Procurement

"In a perfectly competitive market the free choices of buyers and sellers produce an efficient outcome" (Van den Bergh 1994, p. 339). In the public setting, purchasing professionals seek to "buy efficiently and wisely, obtaining by ethical means the best value for every pound spent," and thus maintaining a "correct quality/value balance" (Baily et al. 2018, pp. 4–5). Through contracting out, government brings the potential for acquisition of innovative solutions, high-quality products, and considerable expertise available in the marketplace; private-sector provision of goods and services for public needs can also pose risks. Cumulatively, government spending is big business; in difficult times, government expenditure can make a difference in driving up consumer demand, and encouraging markets toward the road to recovery (*Keynesianism*, see for example Kennedy 2000). Targeted spending for certain groups, like small businesses, has been suggested as a tool for economic growth (Reijonen et al. 2016). There is however a need to balance competing expectations of small business support, transparency, and efficiency, as procurement moves away from purely commercial and regulatory interests (Erridge and McIlroy 2002).

The environment of public procurement is such that government influences, and is influenced by, private-sector markets. As North suggested, "institutions are the rules of the game in a society or, more formally, are the humanly devised constraints that shape human interaction" (1990, p. 3). Institutions "reduce uncertainty by establishing a stable (but not necessarily efficient) structure to human interaction" (North 1990, p. 6). This is the case with public procurement. Deviations from ideal procurement scenarios, already removed from pure-market approaches, produce outcomes that are less efficient and more costly. In public procurement, restrictions and procedures are enacted to assure fairness and prevent abuses, but because the market must respond to specifications and requirements that are different than private-sector purchases, costs can increase. Transaction costs in public systems can be relatively high, due to self-serving actors and considerations beyond the narrow framework of policy (North 1990). An adverse effect of this structure in public procurement is that there may be relatively fewer businesses interested in and

able to response to public solicitations (Stiglitz and Rosengard 2015).

Providing for competition, whether full and open competition or an *adequate* level of competition among vendors, is considered a cornerstone of public procurement, improving efficiency and performance (Nash et al. 2007). Competition aligns with economic theory about reducing externalities and increasing availability of information. "Promoting competition is necessary for protecting the financial interests of the State, ensuring a minimum quality of key public infrastructure and services as well as providing equal economic opportunities to all bidders" (Bhagat 2017, p. 177). At the same time, delays in project schedules can reduce potential positive impact from government spending (Gori et al. 2017), while increasing outlay of resources involved in the procurement function itself.

In public procurement, market analysis is conducted that examines "prices and trends in the competitive marketplace to compare product availability and offered prices with market alternatives and establish the reasonableness of offered prices" (Nash et al. 2007, p. 366). It is reasonable that government would want to rule out any abnormal or unacceptable bids, and choose from among those remaining an offer that provides best value for the client agency or function. Costs should be ordinary, allowable, and consistent with the larger marketplace (Nash et al. 2007).

Pressed by austerity and a need for accountability, governments are increasingly called to "pursue best value" through procurement and "to do so in a transparent and non-discriminatory manner" (Morgan et al. 2017, p. 3140). While it is assumed that public spending supports societal benefits like economic development and socioeconomic improvement, it is not easy to connect the function of public procurement to desired changes in society, to assure causality (Morgan et al. 2017).

## Market Failure and Public Goods

Markets can be effective at dealing with some regulatory issues by themselves, through competition, but there are times when government is compelled to become involved. It has been suggested that markets may perpetuate injustice, necessitating government intervention beyond market forces (Charlesworth and Voruz 1998). In instances of market failure, when the free market has shown itself incapable of achieving efficiency, government may intervene to regulate. Dudley and Brito (2012) suggested four instances where market failure might occur: externalities (where actions by one party cause or increase costs for other parties); public goods (commons); monopolies (one provider of a product/service, with no competition); and asymmetric information (where buyers and sellers have different types or amounts of information, and purchasing activity might be different if the information was the same for all parties).

The potential for achieving positive ends in public procurement is threatened by asymmetric information, as a form of market failure, due to the inefficiency introduced into the market, as well as moral hazard, as suggested by modern economic theory applied to public procurement (Mukhopadhyay 2011). There is at least the potential in public procurement that some information may be shared with certain vendors but not others, giving those vendors with information an advantage. Vendors with better information might increase their revenue (Mandell and Nyström 2013). Certain vendors that have experience with government and its processes may be more successful at winning contracts; outside vendors may be able to provide improved product or a better price, but they might have less of a chance of winning because they lack information needed to succeed. Even complex contract documentation can pose a significant barrier to some vendors, particularly small vendors that have not regularly encountered public procurement processes (Waller et al. 2016). Regulation and restriction may be employed to help resolve or eliminate externalities, but it is difficult in practice to fully address myriad contextual issues.

Centralization of procurement processes may be thought to improve efficiency, especially in situations where rent-seeking is a problem in

lower government levels, even though it means that decisions are possibly made further away from the public ultimately served. However, centralization does not necessarily resolve the potential for unequal gains among stakeholders; further, the decision to centralize or not may not involve much economic analysis (Van den Bergh 1994). Proceeding from a public choice perspective, people are self-serving and intent on maximizing their utility (Mueller 1989), and this can be addressed by constraint in procurement practice; however, this does not mean that people cannot see beyond immediate personal gratification, or work for broader principles, as people have varied wants and needs (Koppl 2018).

## Price Fixing and Collusion

Price fixing refers to "the artificial setting or maintenance of prices at a certain level, contrary to the workings of the free market; an agreement between producers and sellers of a product to set prices at a high level" (Garner 2009, p. 1362). Collusion involves "an agreement to defraud another or to do or obtain something forbidden by law" (Garner 2009, p. 321).

Imperfect competition results in agencies that may buy less or fail to satisfy public wants and needs, because resources have been spent inefficiently on previous contracts (Bhagat 2017). The potential for price fixing and collusion, which results in imperfect competition, exists in public procurement; unchecked, this tendency can result in increased prices, minimally, and cumulatively the loss of substantial public sector resources.

The "gaming" of a public sector solicitation for goods and services by industry may be seen less as a violation of law, and more a matter of gaining competitive advantage by managing an untenable and unnecessarily difficult public procurement system. In a purely competitive public procurement system, what should be *rival* vendors instead reach "consensus on pricing, output, or other terms of trade"; these vendors also detect "deviations from the agreement. . .and [punish] firms that cheat" this agreement (Kovacic 2006, p. 827). Attention thus shifts from serving the public purpose and customer for best cost, to managing a self-serving, public-injuring scheme, that might possibly be only discerned by patterns in bidding over a period of time (Kovacic 2006). Slowness in response by government against such abuses may embolden vendors to further engage in untoward behavior. Even the rules put in place to avoid such abuse, as a result of their inability to bend to specific situations, may reinforce and encourage cartels (Bhagat 2017).

## Conclusion

The economic context of public procurement is challenging, as there are many considerations beyond those seen in private-sector procurement, which speak to ideals of communities and their governments. As Callender and Matthews suggested, public procurement has a role in "balancing the issues of equity and economic responsibility" and bringing the ideals of government into the marketplace, in ways that may reduce operational cost (2009, p. 746). The success or failure of governments' interest in producing value for the public rests to great extent on the effectiveness of public procurement processes and professional staff. Awareness of the economic context of public procurement can assist in addressing potential hazards, as well avoiding choices that result in negative consequences to the government enterprise and ultimately the public.

## Synonyms

Latin American Integration

## Definition

History and future propensity of Latin American and Caribbean countries to align economically and politically.

## Introduction

The dream of a united Latin America has fired imaginations in Latin American countries and the Caribbean for centuries. From the beginning of the postcolonial era, military and political leaders dreamed of uniting the newly independent states or at least aligning them politically into loose confederations. Political realities interfered, and the fledgling states were not yet ready for integration. Perhaps now, however, conditions might allow for a more regional integration along the lines of the European Union, where countries with unique national identities, as well as strong traditions of independence and sovereignty, have allied, eliminating borders, communizing currency, and generally synchronizing foreign policy.

### Revolution and the Postcolonial Environment

The aftermath of the split between Latin American colonies from Spain and Portugal was very different than the experience of the colonies which

formed the United States. The American Revolution was a mutual, coordinated decision based on shared principles enshrined in the Declaration of Independence, which laid the seeds of a united nation. Latin American nations, on the other hand, came to their independence along different paths.

**Paths to Independence**. Over roughly 300 years of rule, Spain governed its American colonies through the establishment of a system of viceroyalties, which by the time of the wars of independence included the Viceroyalty of New Spain, Viceroyalty of New Granada, Viceroyalty of Peru, and Viceroyalty of the Rio de la Plata, centered on Mexico City, Bogota, Lima, and Buenos Aires. Each viceroyalty was divided into regions, governed by *audiencias* which combined executive and judicial powers, as well as some limited legislative and ecclesiastical authority. Over the decades of colonization, a somewhat independent tradition had evolved, with local elite gaining power, yet authority continued to be appointed and exercised by Spain. In the late 1700s, the Bourbon Reforms sowed dissatisfaction among the Spanish colonies as the Spanish crown attempted to reassert dominance. Still, widespread independence movements did not coalesce until the crisis of legitimacy caused by abdication of Charles IV, followed shortly by the abdication and imprisonment by Napoleon of Ferdinand VII in 1808. As the Peninsular War raged and the monarchy was powerless, the colonies were left to administer themselves. In Rio de la Plata, royal bonds were perhaps the weakest; a previous viceroy had been deposed by the people, and Santiago de Liniers was installed and later confirmed by Charles IV. Deposed in turn during Ferdinand VII's captivity, the question of independence was settled by 1812.

Turmoil continued in Spain as the regime of Joseph Bonaparte was not unanimously recognized and the Bourbon loyalists established the *Cortes de Cadiz*, a version of a parliament that included representatives from the colonies, regarded in that body as Spanish provinces. The Cortes passed a constitution granting certain autonomy, but as Ferdinand VII was restored in 1814, the move toward devolution and the Cortes' constitution was repealed to reassert royal supremacy. Revolution temporarily reinstated the constitution in 1820, but absolute rule was restored by invasion in 1823. In the Americas, the disappointment over the failed attempt at autonomy grew to spur the desire for full independence. Various royalists and revolutionary factions warred across the continents, often province by province, until the Viceroyalty of Peru ended in 1824. Spain itself was in no position to conduct the war, as it was busy still fending off its invasions by France.

The Viceroyalty of Brazil, a Portuguese colony, followed a different route. John VI of Portugal fled Napoleonic forces and relocated to Rio de Janeiro in 1808 and elevated Portugal to the status of Kingdom in 1815, shortly before his return to Portugal in 1816. In 1821 the Portuguese Cortes demanded Brazil return to the status of colony; Pedro I, John's heir, refused and declared independence in 1822. While Mexico flirted briefly with the idea of maintaining a monarchy, the Empire of Brazil actually endured for another 67 years. With no crisis of legitimacy, Brazil's independence was peaceful in comparison to other Latin American states.

**The Path to Disunity**. The first and only serious attempt at some form of federation among the new states was the Congress of Panama in the summer of 1826. Simon Bolivar, revolutionary hero and at the time president of both Peru and Gran Colombia, issued an initial call at the end of 1824 to Mexico, Rio de la Plata, Gran Colombia, Chile, Peru, and the United Provinces of Central America. Invitations were ultimately extended to every country except reclusive Paraguay, as well as the United States and Great Britain. Chile and Rio de la Plata declined to attend, and Bolivia sent representatives who never reached the conference. Brazil, though heavily courted, initially agreed to attend but never actually sent representatives. One of the two representatives of the United States died in route, and the other missed the initial conference. Attendance ultimately included only Gran Colombia, Peru, the United Provinces of Central America, and Mexico, with Great Britain attending in observer status.

While the initial congress did result in a treaty, the main thrust of the agreement was a mutually

guaranteed sovereignty and independence of the signatories. Even though the treaty did contain some mutual defense obligations and provisions, these were generally weak and were never implemented. Finding Panama inhospitable during the summer, follow-on congresses were moved to Mexico. Ultimately, the treaty was ratified only by Gran Colombia, and the states went their own directions as fully independent nations.

Clearly, the Latin American experience was different from that of the British colonies. This can be ascribed to several factors. First, Britain's American colonies had a tradition of democracy. The Great Britain of George III was a constitutional monarchy. Unlike today, the monarch still retained enormous political power, but nevertheless the parliament enacted laws with the House of Commons as a full partner. This tradition of representative government was reflected in its colonies, where all had established various forms of legislatures at the time of the American Revolution. This tradition of democracy enabled consensus decision-making, and enacting a representative body at the federal level was a somewhat natural progression. Spain, on the other hand, was close to an absolute monarchy; in fact, in the case of Mexico, it was the possibility of liberalization that sparked a royalist revolt and ultimately led to independence. By the late 1820s, political systems ranged from somewhat liberal and democratic to dictatorial or, in the case of Brazil, still monarchical. Autocratic regimes are unlikely to willingly divest personal power to a federation.

Closely related was the nature of the emancipation processes themselves. In the case of the United States, the colonies jointly convened a Continental Congress and ratified the Declaration of Independence. This same body governed during the Revolutionary War. This body, empowered and trusted to govern, produced the Articles of Confederation and ultimately the Constitution. The Congress of Panama, by contrast, was an afterthought. The movement to independence in the Spanish colonies instead germinated viceroyalty by viceroyalty and in some cases province by province. Though revolutions in some area were organized and funded by other newly independent regions, often with Simon Bolivar leading the forces, there was no theater-wide organization coordinating mass revolution. At the time of the Congress of Panama, there was not only no tradition of democratic governance but only a very limited tradition of cooperation and integration during the various wars for independence.

### Post-World War II Era

After the failure of the Congress of Panama, various efforts continued over the next decade to forge a political alliance. Mexico, spurred by military tensions with the United States, pursued occasional efforts to rally Latin American countries. Peru, also prompted by military concerns, hosted conferences in 1847 and 1864 with no lasting results. Fragmentation actually increased during this time period with the breakup of Gran Colombia in 1831 and the late 1830s dissolution of the Federal Republic of Central America into its constituent states. The process was completed with independence of Panama from Colombia in 1903. Throughout the end of the nineteenth century and the beginning of the twentieth century, there remained a strong pro-union undercurrent in Latin American politics and political thought, but little action resulted.

World War II rearranged the power structures of the world and brought about the new United Nations (UN) organization to promote peace and cooperation throughout the world. In 1948, the UN established the Economic Commission for Latin America (ECLA), also known as the *Comisión Económica para América Latina* (CEPAL). In 1984, ECLA became ECLAC with formal addition of the Caribbean to its title, reflecting its actual broader responsibilities, though the CEPAL acronym remained the same. The mandate of this new organization was to promote and facilitate development throughout Latin America by providing planning, strategy, and a venue for economic cooperation. In its early years, the commission focused on import substitution industrialization (ISI) as a strategy to increase local manufacturing in areas where goods were imported at a premium. Eventually, the commission's philosophy evolved to

recognize the limits of ISI and the opportunity presented by lowering trade barriers and forming an economic block, and ideal promoted through a series of conferences in the late 1950s.

To this end, the Latin American Free Trade Association (LAFTA)/*Asociación Latinoamericana de Libre Comercio* (ALALC) was formed in 1960 by the Treaty of Montevideo. Initial signatories included Argentina, Brazil, Chile, Mexico, Paraguay, Peru, and Uruguay. In addition, Colombia, Ecuador, Venezuela, and Bolivia joined within the decade. LAFTA's primary focus was free trade, accomplished through mutual tariff reductions. However, mechanisms of individual negotiations by commodity proved time-consuming. Plus, member states had varying agendas; weak enforcement and escape clauses allowed member states to protect industries considered essential. Adding to the barriers to implementation was the large number of state-owned industries, which provided especially large disincentives for free trade, and the simple fact that Latin American economies occupied a wide range of development levels. LAFTA member states never met tariff reduction targets, and by 1980 it had collapsed completely, though it was somewhat replaced by the Latin American Integration Association (LAIA)/*Asociación Latinoamericana de Integración* (ALADI) as a forum to coordinate free trade and move to a common market.

During the LAFTA period, subregional organizations arose and provided alternate and somewhat competing paths to economic integration. The Central American Common Market (CACM), including Guatemala, Honduras, El Salvador, and Nicaragua, formed in 1960 and expanded to Costa Rica in 1962. After initial success at tariff reduction in the 1960s, it was eventually torn apart by regional political strife between member states, though it was resurrected in the later 1980s. Another subregional organization, the Andean Community, began as the Andean Pact in 1969. The agreement initially included Bolivia, Chile, Colombia, Ecuador, and Peru, plus Venezuela in 1973. Chile exited in 1976. The community has seen moderate success over the years with both economic and limited political alignment and is today aligned with the *Mercado Común del Sur* (MERCOSUR).

From a political integration perspective, the Organization of American States (OAS), founded in 1948, provides a framework for cooperation among Latin American countries. However, despite some successes, such as creation of the Inter-American Development Bank (IDB), the OAS is not a primary vehicle for driving Latin American integration. Its membership includes non-Latin countries, particularly the United States and Canada. It has best served as a political referee between states and provides a forum for cooperation and dispute resolution, rather than providing strong political guidance and governance.

Lack of regional political cooperation and guidance may be a root cause for lack of economic cooperation during this era. The failure of LAFTA and the subregional economic organizations to make substantial progress on economic integration during this period can generally be attributed to lack of political mandate for successful cooperation. Political instability was routine, for example, the US-backed coup in Chile ultimately led to Pinochet's withdrawal of that country from the Andean Pact. Changing regimes shifted political and economic focus and did not provide an environment focused on economic promotion. While economic integration may ultimately lead to political integration, enduring political commitment appears to be a necessary precursor.

### Modern Era (1980–Present)

The contemporary history of the integration efforts in Latin America is illustrated with the evolution of their institutional integration tools. Starting with the Cartagena Agreement from 1969 that gave rise to the Andean Community of Nations – *Comunidad Andina de Naciones* (CAN) – the changes in the composition and the transformations of the institutions inform about the incentives and obstacles to a stable union. The CAN started as a trade bloc comprising Bolivia, Colombia, Ecuador, Chile, and Peru. One of the main purposes of the bloc was to build a common buffer to the effects of volatility of the commodity markets, particularly in mining industries. Forming such a bloc was a logical step since the founding countries had economies traditionally focused in those areas.

The CAN had its first change with incorporation of Venezuela in 1973. Chile withdrew from the agreement in 1976, citing incompatibilities with the free-market economic policies it wanted to pursue, with the more plan-based policies promoted within the CAN. Peru temporarily suspended its obligations in 1992 due to its liberalization process, leaving only Bolivia, Colombia, Ecuador, and Venezuela to establish a free trade area in 1993. In 1995, the members adopted a custom union and common trade tariffs to be imposed in dealings with nonmember countries. The year 2006 saw the full reincorporation of Peru, but also the withdrawal of Venezuela in protest over the signing of free trade agreements by Colombia and Peru with the United States. Venezuela, in turn, joined another subregional trade block, MERCOSUR, whose membership included Argentina, Brazil, Paraguay, and Uruguay. Thus, currently, CAN membership is as follows: Bolivia, Colombia, Ecuador, and Peru are full members, while Chile, Argentina, Brazil, Paraguay, and Uruguay are associate members. Panama, Mexico, the Sahrawi Democratic Republic, and Spain are observers. The current membership illustrates that CAN is no longer exclusively a trade block of countries with similar economies, but has evolved into a system to support regional policies toward other blocks.

The New Strategic Design of the CAN, adopted in Quito in 1995 and incorporated into the Trujillo Protocol of 1996, defined it as an organizations constituted by different organs and institutions coordinated by the Andean Integration System (AIS). The organizational structure of the AIS has been inspired by the Treaty of Rome that created the European Economic Community, and in addition to the Andean Council of Presidents and the Council of Foreign Ministers, it includes the following institutions:

(i) General Secretariat – The executive body, with a full-time secretary general.
(ii) Andean Parliament – The policy advisory body consisting of five members of parliament from each member country.
(iii) Andean Court of Justice – Judicial body which resolves disputes among member countries.
(iv) Latin American Development Bank (CAF) – With membership beyond CAN, currently includes 19 member countries, two of which (Spain and Portugal) are extra-regional.
(v) Latin American Reserve Fund (FLAR) – A common reserve fund aiming at stability of member; besides the four CAN members, it includes Costa Rica, Uruguay, and Venezuela as its members.
(vi) Simón Bolívar Andean University.

The organs and institutions are divided into three categories: intergovernmental organizations, community organizations, and instances of civil society participation.

In 1999 the CAN and MERCOSUR began negotiating a merger with the purpose of creating a South American Free Trade Area. This was accomplished in December 2004 with the Cuzco Declaration, a cooperation agreement with the intent of integrating all South American States that created the South American Community of Nations. This body was renamed the *Unión de Naciones Suramericanas* (UNASUR) in 2007, also known as the Union of South American Nations (USAN). Nevertheless, the UNASUR agreement does not contemplate the gradual replacement of the existing institutions and structures of CAN and MERCOSUR, therefore potentially indicating the lack of appropriate legal institutions and structures to support the integration efforts.

## Prospects for the Future

The historical obstacles toward the construction of a viable integration within Latin America resided in the weak tradition of political participation of its populace during its colonial times and early development. This, combined with the heterogeneity of its nations and regions, did not allow for a workable integration proposal that assured the satisfaction of all participants. Currently, although there has been significant progress toward participatory democracy and the construction of political institutions, the differences among nations and regions persist.

The rapid evolution and mutation of institutions such as the CAN and the AIS is an indication that long-term goals may not necessarily be the driving force behind the construction of the integrational institution platform; it seems more adapted toward momentary convenience and the allegiances of the moment. This cannot be translated into a workable integration effort that is sustainable through time and contributes toward the goals that are always part of the official discourses: the improvement of living conditions of the citizens of Latin American countries.

## Conclusions

There are still certain factors that can be built upon to ensure a sustainable integratory effort and a real contribution toward enhancing the living conditions in the region. Any integration structure has to have clear goals and a common purpose; this means that regional blocks have to be unified by a cohesion element that resists changes in regimes and even political as well as economic diversions. Small regional blocks with common interests, such as geographical or productive base affinity, can be a start. The next step is to draft a path that is impervious to the politics of the moment, and although this might difficult, it can be provided for with a strong legal institutional framework.

Institutions such as the Inter-American Development Bank (IDB), the Latin American Development Bank (CAF), and the Central American Bank for Economic Integration (CABEI) have been able to navigate the turbulences of conflict within and among their members. All three have been steady sources of funds, especially in times when international lenders have been less than enthusiastic about prospects of projects in the area. This has been largely the result of the strong legal framework of these institutions and the technical base of its operations. These institutions have been able to welcome and retain member states throughout their diverse exercises in social and economic policy.

A more educated and participant population will force their leaders to seek those arrangements that make sense for the country and eschew the agreements and institutions that drain their coffers without any viable prospects. More important, the chances of success of any integration effort hinge upon the solidity of the institutional legal framework and the technical independence with which it can operate. In the case of Latin America, small steps may yield great results in the long run.

## Synonyms

Economic burden of crime

## Definition

Economic consequences for people and society of the actions that try to avoid crime victimization events, of the occurrence of crime, and of the efforts aimed at identifying the perpetrators and assign them penalties through the legal system.

## Section

Latin America and the Caribbean

## Introduction

The negative consequences of crime and violence have a very wide scope, since they affect the

people's prospects of life, the social relations within communities, the countries' institutionality, the political and economic system, the development goals of nations, and their international relations, because recurrently the action of criminal bands goes over States' boundaries, criminal practices are exported, and they are rapidly assumed by local criminals.

Studies of the costs of crime and violence are very useful because together with the indicators of the incidence of victimization, an integrated vision and higher degrees of certitude provide relevant information obtained by rigorous social research methods on the size reached by the problem, the research, expenses, and losses that it generates to citizens, homes, companies, the State, and the economic system. At the same time, the studies of the economic costs of crime and violence provide relevant information to size the resources that the State must invest to face this phenomenon, to clarify the measure of the benefits and the efficiency of the public interventions – one of which would be the cost avoided by the reduction of the criminality and violence indices.

The cost studies are not aimed at establishing accuracy in their estimations, but rather to identify "orders of magnitude" within which the cost of crime and violence falls in a given country or community. The reason for this is that on the one hand crime is an evolving and dynamic phenomenon in its practices, making it difficult to identify the monetary measurement of its consequences. On the other hand, it is necessary to take note that the information needed to estimate the cost of crime is complex and difficult to achieve, and this often leads to making great depuration efforts and applying indirect estimation methods.

Notwithstanding the above, the identification of the "orders of magnitude" within which the cost of crime and violence falls is a highly important information for the political and social actors and the public authorities, because it allows assigning to this problem the corresponding priority in the governmental agendas, in the public policy debate of each country, and in the international forums.

Although little is known, the studies on the cost of crime have had a long development, propelled mainly by practical issues on the fiscal implications of criminal action and by the construction and maintenance of jails. Also, these kinds of studies have been showing great diversification and sophistication over time, and together with this they have been incorporating increasingly novel dimensions into the estimations.

## Conceptual Issues

Crime and violence are social evils with which the States try to deal through public policies aimed at reducing or containing them. The main characteristic of criminality is that it is a social phenomenon, multicausal and multidimensional, that is expressed by means of a behavior that goes against a given social or legal order.

### Crime, Violence, and Costs

According to Grispigni (1928), crime is that disruptive human behavior that seriously endangers coexistence and cooperation among the individuals that constitute a society, and that is described as such in the norms that make up a country's legal system. Consequently, the legal typification of a conduct as crime expresses social disapproval of that conduct, bringing about the imposition of penalties against the responsible person. The idea of a social agreement, expressed in the law, which establishes punishments for conducts considered disruptive, led to understand crime is any activity that is punishable by means of a criminal trial. In agreement with these definitions, committing criminal acts carries liability, and the society has the right to identify those who commit these acts and make exigible the responsibilities derived from them.

Furthermore, the discussion on what is crime has led authors and the legislations of countries to differ between the concepts of crime and misdemeanor. The former identifies those conducts that imply more serious disruptions, while the concept of misdemeanor is normally reserved for those conducts that violate the law in a minor or less serious way. Although both conducts are punishable, the severity of the penalty is associated with the seriousness of the action.

In view of the above, some conducts that can be considered crimes in one country may not be in another, because the legal order is an issue defined in the political realm of societies and varies depending on the country to which one is referring. Therefore, a common typology classifies into crimes against persons and crimes against property, in which economic crimes also fit.

Crimes against persons include murder, injuries, and rape. Murder is defined as death caused deliberately to a person. Injuries refer to a physical attack against a person that results in bodily harm of the attacked person. Rape is understood as a sexual encounter without valid consent. Kidnapping is defined as the "deprivation of the freedom of a person, fully identified, against his will, demanding an economic or other advantage in exchange for his freedom" (OEA 2013). Extorsion is defined in the following terms by the Código Penal Guatemalteco: "Whoever, to get an unlawful gain, to defraud, or demand whatever amount of money with violence or under direct or covert threat, or by a third party and by any means of communication, forces another one to deliver money or goods; and also when with violence forces him to sign, enter into, grant, destroy or deliver some document, enter into an obligation, or condone it or renounce some right" (Guatemala, Congreso 2009).

In turn, theft and robbery regularly configure so-called crimes against property, although a wider view would include so-called economic crimes. Theft is described as removal of property without the owner's consent. Robbery is defined as removal of property, without the consent of the owner, in an act which involves the use or the threat of the unlawful use of force. Economic crimes refer to swindles and frauds, usury, fraudulent use of bank accounts, obtaining credits fraudulently, tax crimes and breaches, crimes against industrial and intellectual property, and similar offenses.

Situations of violence, in turn, appear recurrently associated with criminal events. The main characteristic of violence is that it is a multicausal phenomenon affected by psychological, biological, economic, social, and cultural factors, among others. The phenomena that accompany violent behavior constantly cross the boundaries between individual, family, community, and society. In turn, violence has consequences that encompass the individual, family, communal, and social realms.

According to the OMS (2003: 5), violence consists in "the intentional use of physical force or power, threatened or actual, against oneself, another person, or against a group or community, that either results in or has a high likelihood of resulting in injury, death, psychological harm, maldevelopment, or deprivation."

According to this definition, violence assumes the following modes:

- *Self-directed violence*: It refers to violence in which the perpetrator and the victim are the same individual and is subdivided into self-abuse and suicide.
- *Interpersonal violence*: It expresses conducts perpetrated by an individual toward another person, and it results in psychological, emotional, sexual, or property injuries and/or damage. Interpersonal violence includes child maltreatment, domestic violence, elder abuse, sexual violence, violence in the workplace, youth violence, and criminal violence.
- *Collective violence*: It refers to behaviors developed by a group in relation to a person or another group, and it results in psychological, emotional, sexual, or property injuries and/or damage.

In this context, the expression costs of crime and violence refer to one of the consequences of crimes against property (the expression crime against property is expressed here in a broad sense, including economic crimes) and persons, associated with the loss of well-being suffered by the victims and society and that are susceptible of being appraised economically.

Therefore, the estimations of the cost of crime and violence express the monetary valuation of the investments made by persons and organizations to avoid being victims of crimes and violence, to the direct losses and expenses and the income not perceived by the victims as a consequence of a criminal act, and to the expenses made

by the State to approach and control the phenomenon of crime and the violent action of groups that promote it.

### Direct and Indirect Costs

The distinction between direct and indirect costs refers rather to the items that are included in the estimations and not to the way in which they are produced. Direct costs identify those losses or expenses that arise as an immediate consequence of the criminal action, of the public efforts to control it, establish and pursue the responsibilities of the criminals, and/or assign punishments or penalties. The indirect costs express near future consequences and allow seeing the welfare loss that appears in time as a result of the occurrence of criminal acts.

The costs that the studies include recurrently as direct are medical expenses; the cost of the police, courts, and jail system; the price of the robbed goods; and the amounts paid in kidnapping and by extorsions, while the indirect costs include income not received, uncollected taxes, the cost of opportunity, investments to avoid being victims of a crime, and the like.

### Tangible and Intangible Costs

The estimations of recurrent cost distinguish between tangible and intangible costs. The notion of tangible refers to those costs which, when reduced or eliminated, make the resources become available for other uses. These are costs in which persons, organizations, and communities incur to avoid being victims of criminal actions, which appear as the result of the perpetration of crimes – such as robberies and thefts – and those that arise as a result of the efforts to identify those responsible for the crime and assign them a penalty. The intangible costs, on the other hand, are associated with pain, anguish, suffering, and loss of the quality of life and effects on the labor market, personal trauma, and changes in habitual behavior, threat of becoming victimized or subjected to violence, loss of interpersonal trust, and deterioration of social capital or of tranquility and freedom.

Although conceptually it is possible to identify clearly the intangible costs caused by criminal action, they are more difficult to be estimated and reduced to a monetary measure, and they often generate a discussion on the ethical scope of those measurements. That is why rather reiteratively the studies of the cost of crime and violence omit them from the estimations.

## On the Estimation of Costs

### On the Methods

The efforts to estimate the costs of crime and violence are complex. Conceptually, they assume a comparison – sometimes implicit and others explicit – between a situation with crime and/or violence and others without these social evils. The methods most widely used by the studies are those of contingent valuation, hedonic prices, and the accounting of losses, expenses, and expenditures motivated by the criminal action.

The contingent valuation method tries to identify the willingness of a person or community to pay to improve, avoid the worsening of their welfare conditions, or compensate for damage or the not produced improvement. For that purpose the interested parties are asked directly about their willingness to pay in the face of, for example, preventing crime and violence to grow in the sector where they live. Using this method in the case of Argentina, Ronconi (2009) identified that the average willingness of those surveyed to pay to avoid being victimized was US$1028 and US$256 to avoid contact with a criminal.

Although this method is used in studies on the behavior of consumers, its disadvantages require care with the information that is collected and with the estimations that it delivers. One of them is that since they are based on the responses of those surveyed, they can behave strategically if they realize that it will be either them or the State that will pay for the welfare improvements or to avoid damages. Furthermore, several biases that the method has have been identified by the specialized literature, such as the instrumental biases, like that in which the question identifies a certain amount of money, when the surveyed person gives a different answer from that which would have been given to avoid causing discomfort to

the surveyor, when the payment method affects the response, that situation in which the response is conditioned by the information of the surveyee on the probability of executing the project, or the place occupied by the project in the list of alternatives submitted to the surveyee.

The hedonic price method has also been used to estimate the characteristics that determine the market price of a property, particularly in the estimation of prices in the housing market. The method states that the value of a property would correspond to the sum of the values assigned to its characteristics, so the price of a house, for example, would be determined by the characteristics of the house, the neighborhood, the pollution in the zone where it is located, and the social characteristics such as segregation and criminality levels of the neighborhood. Thus, applying this method it would be possible to estimate the differences in the price of housing and consequently to measure the cost of the crime.

The usefulness of the studies based on this method is therefore aimed at identifying the losses that would be caused as a result of reaching high levels of criminality in a given zone – compared to another one without criminality or with low levels of it – or the earnings in the social welfare derived from the reduction of criminal victimization. The great usefulness of this method lies in estimating intangible costs, where the security attribute of homes can be isolated. The difficulty, of this method, however, lies in finding similar comparable quarters or zones, where the difference between them is given by the levels of criminality that they present. So in view of this difficulty, the usefulness of this method is restricted.

The method of accounting losses and expenses has been used extensively, due to its greater simplicity, the lower cost of producing it, and because it makes use of information already produced by the agencies themselves – public and private – related to the efforts for crime control. This method identifies costs as the investments made by people and organizations with the purpose of avoiding becoming victims of crime and violence, the sum of the value of the goods robbed and stolen, the income not received by the victims as a result of a criminal act, the costs of medical help of the victims, and the expenses made by the State in order to dissuade the occurrence of criminal acts, identify those who have perpetrated a crime, prosecute their responsibilities, and apply the penalty determined by the courts of justice. The analysis of crime economics also incorporates the losses derived from the practice of extorsion and the cost of social opportunity of someone being devoted to a crime career instead of opting for allowed activities.

In any case, the latter cost is particularly difficult to estimate. The exercise of estimating the cost of social opportunity that arises when a person carries out criminal activities is particularly complex. Besides the harm caused to the victims and the expense made by the State in the investigation of the crimes in which it may be involved, in the work of the judicial power, and in the jail system, there is a social loss that is equivalent to the licit work which that person would have done if not involved in criminality. This needs full information on the size of the criminal force and on its distribution by age and gender, something that is very hard to obtain.

On the other hand, it is recurrently cited that crime can cause negative effects in the economic growth trends of the countries, by affecting the business climate and increasing the cost of the safety of the operations. Although the conceptual arguments are coherent, there is no clear evidence so far about this assertion.

In spite of this, the "Enterprise Survey" allows approaching the effect generated by a set of crimes in the business climate. The survey include items such as losses of the companies – measured as percentage of their sales – due to theft and vandalism against the company, payment of bribes, and the costs of security.

## Discussions on What Is the Cost of Crime

Varied conceptual discussions have emerged on the estimation of the cost items that have been identified in the previous sections of this entry. A highly important one is the assignment of a monetary value to life, where the objections that arise in the moral plane propose that reducing life to an amount of money is contrary to the universally accepted idea of the superior dignity of

human life. The objection also points out that these kinds of estimations do not take into account the pain, sorrow, or trauma implied by the loss of the father, mother, child, brother, or sister for the rest of the family members, a rape, or the sequels left by victimization.

Although these objections are correct, from the moral viewpoint, it is necessary to remember that the studies of the costs of crime and violence have the purpose of estimating the amount of money that society loses, wastes, invests, or fails to receive as a consequence of the existence of criminal and/or violent events. It is this context and the mentioned purpose, then, which make us want to identify the monetary losses and costs generated by homicides, injuries, sex crimes, and criminal victimization actions on people.

Two methods have been commonly used for these estimations: the demographic method and that of human capital. The former has been used in the estimations of the cost of drug abuse, and it is based on a comparison of the size and structure of a population in which there is consumption of psychoactive substances with the size and structure of a population in which hypothetically there is no consumption. Although this method has its origin in estimations of the cost produced by illicit drug consumption, it can be extended to the calculation of the human cost caused by crime and violence.

The human capital method, on the other hand, identifies the value present in the income not received as a result of victimization. These kinds of estimations make use of the results of the studies of burden of disease established by the healthy life years lost (or disability-adjusted life years, DALYs) by premature death and by disability for every registered pathology and normally use the average salary, average income, or the per capita gross domestic product (GDP) to avoid biases toward some socioeconomic group or gender.

Another discussion that runs around the cost of crime studies is whether what is robbed and stolen should be considered as a social loss. The discussion may even be extended to the amounts taken by the criminals from the execution of acts of kidnapping, extorsion, or so-called economic crimes. The argument that states that it would not be a social loss is based on the fact that there would only be a transfer of ownership between the legitimate owner and that who takes possession of the goods by means of a criminal act, because the goods still remain in the society; they do not disappear. The opposite argument presents variations. On the one hand, there would be a social loss that could get to be equivalent to twice the value of the goods, because both the legitimate owner and the criminal invest up to an equivalent of the price of the goods, either to defend them, the legitimate owner, or to keep them (illegitimally), the criminal. On the other hand, it should be noted that the stolen goods are traded at a much lower value than in illegal markets, that there is a social opportunity cost in the time that the criminal devotes to stealing the goods – instead of occupying it a legitimate activity–, that there is a loss of welfare of the legitimate owner, and that the victims tend to replace the stolen goods, which implies that they have to use part of their income to it instead of using it for buying other goods or services that increase their well-being. This argument, in turn, makes the value established for the stolen goods in the estimations be that assigned by their legitimate owner or the values paid by the insurance companies in these kinds of claims (another valuation method, such as discounting the depreciation of the purchase price, is difficult to implement because the homes very rarely have that information available).

Another kind of discussion that appears in relation to estimations refers to which items should be considered in the cost of crime and violence studies. Sometimes there are estimations based on appreciations of the time that would be devoted by each home daily to close doors and windows to avoid being victimized, on the expense that would be implied in having a dog or some other animal that would frighten away potential criminals and the investment needed to build fences and metal protections on doors and windows in houses, stores, and companies. Although the purpose of protection may be present in all these initiatives, the basic issue is that they also involve other motivations, such as the

desire for privacy, intimacy, and insulation against extreme outside cold or heat by closing doors and windows, the need for company and an expression of affection by having animals, and esthetic and ornamental criteria by placing fences. Furthermore, the lack of accepted or demonstrable standards in each of these items makes the estimations be based on subjective appreciations and therefore having a weak empirical foundation.

Viewed in perspective, the discussion on the items to be included in the estimations, how they are conceptualized, and the assumptions made in the studies are at the base of the variability presented by alternative studies of the costs of crime on the same country or community. Therefore, the efforts for making studies aimed at comparability in time or between countries or communities must first solve these issues.

## The Literature on Costs of Crime and Violence

The first recorded estimations go back to the beginning of the twentieth century, with the work of Smith (1900) on the costs of crime in the United States and, then, three decades later, with the study on the same country of the National Commission on Law Observance and Enforcement (1931). In recent decades there has been a rebirth of interest in studying the phenomenon, and the analyses have been increasingly integrating the economic consequences of the criminal action as well as the violence (for a review of the history of the estimations of the cost of crime, see Czabanski (2008)).

The efforts in the 2000s to estimate the cost of crime based on revealed preferences have largely concentrated on the effect on the price of housing. More recently, the study of Bishop and Timmis (2011), also based on the method of hedonic prices, finds that the willingness to pay to avoid being victimized violently (measured in cases by 100,000 residents) increased 10 cents for every additional incident.

Latin American studies that have applied hedonic models have had different results. Vetter et al. (2013) found that the increase in the percentage of persons who felt safe in the home in a standard deviation (18.7%) (the work of Vetter et al. (2013) also found that the percentage of homes in which all the household members felt safe from being victimized was, on the average, 41.3% for the metropolitan areas of Brazil) would increase by 8.4% the value of the rent of property in the metropolitan areas of Brazil. Ajzenman et al. (2014) found that there was no impact of the wave of violent murders related to drug traffic on the price of the properties in 1465 municipalities of Mexico from January 2008 to December 2010.

The method of contingent valuation has been used to estimate the willingness to pay for a drug treatment program in the community with the purpose of reducing crime; for a gun reduction program; for a program for reducing robbery, mugging, rape, and murder; and for initiatives for the reduction of common mugging, slight injuries, and serious injuries and to estimate public support for proposals of rehabilitation or jailing youngsters having conflicts with justice. In a study on Argentina, Ronconi (2009) concluded that the willingness to pay to avoid being victimized is considerably higher (more than twice) among those who had been victims of a crime, compared to those who had not.

The method of accounting losses and earnings has been used more extensively for the cost of crime and violence estimations. The types of costs included normally in these kinds of studies refer to the investments to avoid victimization, to the valuation of the losses produced by the criminal and violence action, such as the value of what was stolen, the stolen goods, the economic crimes, the costs of health recovery, the income not received because of death and/or injuries, and the expense incurred by the State, private agencies, and citizens with the purpose of identifying and making effective the responsibility of those who have committed the violent and/or criminal acts.

In the context of this approach, Brand and Price (2000) classify the cost according to the opportunity in which it is produced, which would be in anticipation, as a result of, and in response to the crime. The total estimated cost of

crime in England and Wales, according to this study, would be 7% of the GDP in 1999 and 2000. The study of Bowles and Pradiptyo (2005) shows that between 27% and 32% of this cost is attributable to youngsters aged between 18 and 24 years. A 2003/2004 update of the estimations of Brand and Price, for the same countries and with methodological updates, states that the cost of crimes against persons and homes dropped 9% between 1999/2000 and 2003/2004, that serious injuries reduced their cost, that the other injuries increased it, and that the cost of health and the forgone income because of sex crimes also increased (Home Office 2005).

Using the same approach, Rollings (2008) estimated the cost of crime in Australia at 4.1% of the GDP for 2005, which would imply an increase compared to estimations with data from 2001. In turn, Roper and Thompson (2006) estimated the cost of crime in New Zealand at 6.5% of the GDP, 77% of which would correspond to private costs and 23% to costs of the public sector. The categories analyzed in the New Zealand study include crimes against persons, such as violent and sex crimes and robbery; against private property, such as larceny, home robbery, damage to property, and fraud; and other crimes without direct victims, such as crimes related to drugs, traffic, and other similar ones.

Studies in the United States for the 2000s, related to the accounting method, have tended to approach conceptual and methodological aspects and to present estimations of particular items of cost, instead of concentrating on the total cost of crime and violence. Along this line, Lindgreen and Gifford (2000) estimated at US$120 billion the expenses of the State on crime and violence. Cooter and Ulen (2000) calculated at US$65 billion the costs of private prevention, and Witte and Witt (2001) valued at US$46.2 billion the protection and legal advisory services. Other studies of this type have estimated the cost of rape to the victims in health attention, in forgone income, in judicial cost, and in jail costs for the offender, the forgone income for the victim and the offender, short-term medical expenses, and damage to property or material losses. Similarly, a study by Cohen and Piquero (2007) estimated that a typical youngster with high sociodelictual risk during his life generates a cost of US$4.2 to US$72 million, 65% of which would correspond to the costs associated with the criminal career of these youngsters – which include the cost of the crimes committed, the cost of the criminal justice system and imprisonment, and the cost of opportunity of the victimizer – and the rest would be distributed over lost productivity, dropping out of school, and drug abuse.

On the other hand, a study of ten countries in Europe, Oceania, and America on State expenses to fight crime and violence, in the proportion of per thousand of the GDP, concluded that the expense in Australia was 10.53, in Austria 12.60, in Canada 11.25, in Denmark 7.64, in England and Wales 15.07, in France 8.26, in Germany 10.43, in Holland 11.57, in Sweden 10.34, and in the United States 15.64 (Van Dijk and Waard 2000).

The studies of the cost of violence have shown a variety of results. The compilation made by the World Health Organization (WHO 2004) shows that the estimations of the cost of homicides vary from US$15,000 in South Africa, US$602,000 in Australia, US$829,000 in Austria, and more than US$2 million in the United States. The same source points out that in the United States, the cost of child abuse represented 1% of the GDP, the cost of domestic violence reached 0.1% of the GDP, and the added cost of violence was estimated at 3.3% of the GDP. In turn, Pfizer (2001 in WHO 2004) estimated that the joint cost of crime and violence was equivalent to 5% of the GDP of the industrialized countries and 14% of the GDP in low-income countries.

In Latin America the studies in the decade of 2000 have followed two lines: those that have a regional perspective and those that deal with national cases. Among the former there is the work of Londoño et al. (2000), which points out that the cost of violence on goods and persons is equivalent to 14.2% of the Latin American GDP, that the loss in human capital reaches 1.9% of the GDP, that the loss of capital resources is in the order of 4.8% of the GDP, and that the transfers from victims to offenders are 2.1% of the regional GDP. Along the same line, the study of Acevedo

(2008a) estimates that the cost of crime and violence in Central America is 7.7%, including the costs to citizens, the action of the control system, and health care.

The studies of national cases show a wide variety of estimations and cost categories considered. A report by the World Bank (2007) shows that the cost of crime in Trinidad and Tobago was 1.6% of the GDP in 2003, including costs of lost productivity, funerals, and security for the companies; that the cost associated with crime in Jamaica for health care, lost productivity, and public expenses in security amounted to 3.7% of the GDP in 2001; and that if Haiti, the Dominican Republic, Guyana, and Jamaica could reduce the rate of homicides to the level of that of Costa Rica, they would increase their economic growth rates by 5.4%, 1.8%, 1.7%, and 5.4%, respectively. In turn, a study of crime and violence in Central America shows that the sum of the costs – as a proportion of the GDP – incurred in health care, public safety, and the administration of justice expenses, costs of security of homes and companies, and material losses amounted in 2006 to 7.7% in Guatemala, 10.8% in El Salvador, 9.6% in Honduras, 10% in Nicaragua, and 3.6% in Costa Rica (Acevedo 2008a). A study of the United Nations (2007), on the other hand, estimated in 7.3% the cost of crime in Guatemala and 11.5% in El Salvador.

In a comparative study, Londoño and Guerrero (2000) analyzed the costs of health, material losses, losses in productivity, investment, work, and consumption, and transfers, concluding that the costs of crime and violence in relation to the GDP represent 24.9% in El Salvador, 24.7% in Colombia, 11.8% in Venezuela, 10.5% in Brazil, 5.1% in Peru, and 12.3% in México.

In studies of countries, the work of Acevedo (2008b), based on costs of health, institutional, security, and material losses, estimates the cost for El Salvador in 2007, at 10.9% of the GDP, 0.1% higher than his own estimations for 2006 and much lower than those of Londoño and Guerrero for the end of the 1990s. The study of Olavarría (2005) estimates in 2.06% of the GDP the cost of crime in Chile for 2002, based on the analysis of the costs oriented at preventing being victims of a crime, the sum of what is robbed, stolen, and frauds, the cost of domestic violence, and the State's expenses. Ronconi, in turn, based on victimization surveys, estimates at 14.2% of the GDP the cost of crime in Argentina, including lost production, preventive measures, the feeling of insecurity, the value of what is stolen, and physical or mental health. Furthermore, Olavarría (2009) calculates the cost of drugs in Chile in 2006 at 1.03% of the GDP, including the costs of reduction of demand and supply; lost productivity; the costs of hospitals, jails, and funerals; and the size of the drug market in Chile, estimated at US$134 million of that year. Another study by Olavarría (2015), with data for 2010, estimated the cost of crime and violence in terms of the GDP at 2.42% in Chile and Uruguay, 1.95% in Costa Rica, 3.81% in Paraguay, and 4.78% in Honduras. On the other hand, a study on Brazil concludes that if there had been a reduction of 10% in the homicide rate per 100,000 inhabitants, there would have been an additional increase of the GDP between 0.7% and 2.9% (World Bank 2006).

Crime and violence studies tend to concentrate on the identification of tangible costs, in view of the difficulty, lack of data, and assumptions presented by the estimation of intangible costs. On this issue, Dolan et al. (2005) argue that the estimations of intangible costs such as pain, sorrow, and suffering experienced by the victims are not very robust. Using a method based on the estimation of the "disability-adjusted life years" (DALYs) – which they consider more defendable – they conclude that rape is the one that generates the largest losses, followed by other injuries, common assault, serious injuries, murder, robbery, and other sex crimes. The study on England and Wales (Home Office 2005) identifies the DALYs of the violent crimes that were included in the "British Crime Survey" (BCS), to which it then assigned a value that they consider appropriate for that reality. The results of these estimations indicate that the physical and psychological damage of the violent crimes accounted for 50% of the total cost of crimes and violence against persons and households in 2003/2004, which would imply a reduction with respect to the previous calculation made by Brand and

Price (2000). The study of Roper and Thompson (2006), using the same method as the Home Office (2005) study, calculates the intangible costs of crime and violence due to violent crimes (robbery, sex crimes, and similar ones), concluding that the intangible costs were 43.8% of the total crime and violence costs in New Zealand in 2003/2004.

McCollister et al. (2010) take a different view to estimate the intangible costs of crime and violence. Their estimations are concentrated on rape and sex crimes, robbery and serious assault, and murder. The estimation of the cost of pain and suffering for these crimes was based on the judicial compensations awarded to the victims, adding a correction for the murder risk. The calculations show that murder is what generates the highest intangible costs, followed by far, in decreasing order, by sex crimes, serious assault, robbery, arson, home robbery, automobile theft, and other thefts and stealing.

Latin American studies of the 2000s refer mainly to the tangible costs of crime and violence, although some also identify intangible costs. Among them, the study of Londoño and Guerrero (2000), based on surveys in which the willingness to pay for living in a situation of no violence is declared, estimated that the deterioration in the investment and productivity environment represented 1.8% of the GDP and that the deterioration of the consumption and work environment was equivalent to another 5.3% of the Latin American GDP. In turn, the study of Acevedo (2008a) estimated – based on the compensations that the victims would have received if the values used by the Department of the Environment, Transport and Regions (DETR) of the United Kingdom had been applied – that the emotional damage for crime and violence in Central America in 2006 would have been equivalent to 2.2% of the GDP of the subregion (the cost of the emotional damage by country, with respect to the GDP, would be the following: Guatemala 2.3%, El Salvador 3.4%, Honduras 2.4%, Nicaragua 3.1%, Costa Rica 0.9%; Acevedo 2008a: 14). Using the same method, Acevedo (2008b) estimated the emotional damage for 2007 in El Salvador at 2.5% of the GDP. In the case of Argentina, the study of Ronconi (2009), already cited when estimating the willingness to pay among those who had been victimized and those who had not, may presumably be capturing the cost (intangible) caused by the suffering or sorrow of having gone through this situation.

On the other hand, a report of the World Bank on the Caribbean (World Bank 2007), but without assigning money values, identifies other intangible costs of violence, such as the effects on social capital, the routine conducts, and recreational activities outside the home. In the case of Jamaica, the inhabitants of the neighborhoods with greater levels of crime suffer the effects of being stigmatized, which implies greater difficulties to find jobs. In the Dominican Republic, the main intangible costs of crime are expressed in a set of activities that the citizens avoid due to fear of being victimized, such as leaving their house alone, attending recreational activities, going out at night, or visiting friends and relatives. In the case of Haiti, the people avoid going to Port-au-Prince or the nearest large cities, going to the local market, visiting friends or relatives in their city, going to the bank, going to their neighbors, going to work, and going to entertainment locations. The study of Demoscopia (2007) states that the Maras – a form of disruptive social capital – in Costa Rica, Nicaragua, El Salvador, Guatemala, and Honduras – is involved in the traffic of drugs and guns, kidnapping, contract killing, robbery, assaults, extorsion ("tax collection") of neighbors and merchants, threats, and links with organized crime, all of which would inhibit practicing social relations and the strengthening of bonds of trust (A study by Olavarría and Allende 2014 shows that in those neighborhoods of the city of Santiago in Chile where there is more trust among the neighbors, there are lower levels of crimes and violence.), deteriorating sensibly the welfare of the communities.

Recent Latin American studies on the indirect costs of crime and violence have tended to focus on aspects of health, education, and the effects of adolescent penal responsibility on the occurrence of juvenile crimes. The work of Foureaux and

Manacorda (2013) found a negative and significant effect of violence contexts – measured by the rate of murders in the municipal districts of residence of the mothers – on weight at birth, accounted for by premature births, an effect that would concentrate on the first trimester of pregnancy. The study by Ibáñez et al. (2013) shows that after the implementation of Law N° 1.098 of 2006 in Colombia – which increased the age of adolescent penal responsibility from 12 to 14 years, which established that adolescents between 14 and 16 years could only be sent to correctional facilities if they were involved in cases of homicides, abductions, and extortion, and reduced the severity of the penalty to youngsters under 18 years of age – the rate of robberies and thefts had increased, which may be associated with changes in the incentives of the police, that the already mentioned effect would be greater in municipal districts with a larger proportion of youngsters under 14 years, and that school attendance in that group of children had decreased, with greater incidence in homes with less schooling. The research of Guarín et al. (2013), which also considered the effects of Law N° 1.089 of 2006 of Colombia, found that those youngsters who were arrested after the age of 18 years took 300 more days to commit a new crime, compared to those who had been arrested before that age, but those who had been arrested had a lower probability of attending school and had less schooling. The analysis of Agüero (2013) established a strong association between violence against women and the health of the children in Latin America, and in the case of Peru, the presence of emergency centers for women reduces the probability of domestic violence against them.

## Concluding Remarks

What this review shows is that concerns for identifying the costs of crime and violence have been developing for somewhat more than a century, that findings of these studies are useful for designing public policies aimed at reducing or containing criminal activity, and that methods used commonly have been contingent valuation, hedonic prices, and the accounting of losses and expenses, with the latter used most extensively.

The studies have also been showing the magnitude reached by the phenomenon of criminality and violence in each country – by identifying the cost that they generate for the citizens as well as for the State – and in this way they have contributed valuable information to give priority to State's interventions on this matter. Furthermore, the diversity of the amounts of costs that have emerged from the estimations has been showing also the difficulty of making comparisons between countries as well as intertemporal in a given country. This is doubtlessly one of the most important challenges that these kinds of studies must face from now on.

# Economic Crisis and Administrative Adjustments (Reforms) in Ireland and Greece

Konstantinos Kougias
Department of Social Policy, Democritus University of Thrace, Athens, Greece

## Synonyms

Redesigning; Reform; Reorganization; Revision

## Definition

An administrative reform is a conscious, well-considered change that is carried out in a public sector organization or system for the purpose of changing both (a) the structure and procedures of the public bureaucracy, and (b) the attitudes and behavior of the public bureaucrats, in order to promote organization effectiveness and attain national development goals.

## Introduction

The global financial and economic crisis, followed by fiscal crisis, led many European Union's (EU) governments to plan and implement austerity measures in order to cope with the concurrent problems of lower revenues and high public deficit and debt. Some euro area member states received external financial assistance on condition of severe austerity and reform programs. Economic adjustment programs involve three types of conditionality: fiscal measures aimed at reducing public debts and deficits; financial measures to restore the health of the financial sector; and structural reforms to enhance competitiveness.

This entry analyzes the impact of the Eurozone crisis on European bureaucracies, namely Ireland and Greece. The recent scholarly research has explored the crisis effects on public administration but empirical studies are still few in number and are focused on West European countries such as Britain, Germany and the Netherlands (Kickert 2012) or on clusters of European bureaucracies such as the Southern European administrations (Sotiropoulos 2015). However, less attention has been devoted to the interplay among administrative capacities and external forces in explaining the outcomes and evolution of reform patterns within the group of countries that were so severely hit by the crisis that they had to be bailed out.

With the purpose of addressing this gap, the entry carries out explanatory and exploratory research by focusing on the policy mix that has been adopted in response to the crisis and tries to empirically measure its impact on public administration. What is the impact of the reform programs on the performance of public administration, both in quantitative and qualitative terms? And moreover what explains changes and continuities in the Irish and Greek public administrations and government structures after 2010? These questions form one core argument, suggesting that the scale of fiscal crisis and changes in public administration do not necessarily go hand in hand. Fiscal crisis interacts with reform design and in-built restrictions, setting the limits of the administrative change.

The rest of the entry is structured as follows: In the first section the study summarizes the characteristics of the Irish and Greek public bureaucracy, then it is discussed the changes in public administration that had already started to unfold before the onset of the crisis. The second section provides an overview of the measures that were included in the policy programs of the crisis period. It is argued that, despite the fact that the origins of the economic crisis were different in the two cases under study, the responses to the crisis, as far as administrative reform was concerned, namely an intensification of post-NPM reforms, were similar. In the fourth section, the main findings are critically discussed, and certain explanatory variables are suggested. The contribution to the current debate is then outlined.

## Trajectories of Administrative Reform Before the Economic Crisis

The introduction of the Strategic Management Initiative (SMI) in 1994 was a critical juncture in the modern phase of public service reform in Ireland (Boyle 2016a). The SMI promoted public sector reform with an emphasis on the delivery of a quality service to the public, while new practices in respect of financial reporting, human recourses, and customer service were introduced (OECD 2008:77). Although SMI emerged from within the civil service itself and received initial political support, it was never fully embraced by successive governments and its implementation was limited on all the conventional measures. At the end of the Celtic Tiger era, public-sector bodies, staff numbers, and pay in the public service had increased significantly (Boyle 2016a).

On the eve of the crisis, the Irish government was handed the final report of a study on the Irish public service it had commissioned the Organization for Economic Co-operation and Development (OECD) to undertake (OECD 2008). The OECD report, titled *Ireland: Towards an Integrated Public Service*, acknowledged that since the early 1990s, "Ireland has significantly advanced along a 'NPM' continuum" (OECD 2008:18), but also found considerable scope for improvement (OECD 2008). The onset of the financial crisis caught Ireland with an administrative system characterized by organizational fragmentation and complexity and a weaken political authority to control the size and cost of the public service.

In Greece, the current governance model was established in the 1970s following the country's transition to democracy. The transition to democracy lasted until the late-1980s and was characterized by a series of institutional reforms. The purpose of the reforms was to strengthen the rule of law and the Weberian aspects of state operation, serve the values of integrity, and enhance the reliability of the political-administrative system (Spanou and Sotiropoulos 2011:725). In the 1990s the Economic Monetary Union (EMU) and Maastricht criteria shifted the political agenda and created windows of opportunity for economic and managerial reforms. Europeanization pressures and neo-liberal ideas to some extent influenced the "modernization" period 1996–2004, yet economic and managerial reforms were less visible and observed particularly in policy areas related to economic competition, opening up the market, and reducing the size of public sector, thus affecting the scope of state intervention more than the administrative apparatus as such (Spanou and Sotiropoulos 2011). Despite the establishment of agencies and the introduction of management by objectives and performance management during the "modernization" period, the politicization of the public administration, the indifference, and the low prioritization weakened reform momentum. Change was incremental and followed pre-established paths (Spanou and Sotiropoulos 2011).

## The Different Origins of Economic Crisis

When the crisis erupted, the fiscal condition in the two countries was characterized by ongoing deficits, rising government debt, deficits in account balances, and high borrowing. The Irish crisis was a case of a busted property bubble that has created big problems in the banking system. The general government deficit rose to 7.3% in 2008 and climbed to 31.2% in 2010 as a result of bank recapitalization. The state bailed out the busted banks and took on debts it could not sustain (public debt at the start of 2008 was 27.5%, by the end of 2010 it stood at almost 110%). In Greece, structural reforms remained timid during the first decade of the 2000s, while the sovereign debt increased. As a result, Greece had proven unable to manage its soaring public debt (129% of GDP in 2009) and by then almost chronic budget deficit (reaching 14.9% of GDP in 2008).

Both countries soon saw their fiscal situation deteriorating and applied for a bailout agreement. These agreements were officially embedded in Memoranda of Understanding (MoU) and were negotiated between national governments and the "Troika," consisting of the European Commission, the European Central Bank, and the IMF. In April 2010 the Greek authorities, the EFSF and the IMF representatives signed the first MoU for a loan agreement of €110 billion. Shortly

afterwards two other bailout programs were signed in 2012 and 2015 of €130 and €86 billion, respectively, as the situation proved to be economically unsustainable. Ireland implemented a single financial assistance program (titled the "National Recovery Plan") which began in November 2010 (€85 billion) and lasted, till the end of 2013.

MoUs linked policy conditionality with the payout of successive loan tranches. Along with drastic fiscal consolidation, a key element of the MoUs was the urgent reform of public administration and the modernization of its regulatory system (Spanou 2015:32). In stark contrast, the Irish MoU hardly mentioned public administration reform (European Economy 2011). Rather, it focused on macrolevel targets for public service numbers and structural reforms to particular sheltered sectors.

## Similar Policy Mix

The Irish government followed the unilateral way of action in the first round of spending cuts in the public sector in the budgets for 2009 and 2010. However, this pattern has changed after 2010, as in the Croke Park Agreement and its successors (Haddington Road and Lansdowne Road Agreements), the government and the Public Service Union have agreed on a series of pay and productivity measures to be implemented in the Public Service. In Greece, following the example of the other Southern European countries, the government decided unilaterally on major policy issues, such as civil service salary levels and the hiring or dismissal of public employees.

The decision making and implementation processes took place in a top-down manner. In Ireland, the Economic Management Council (EMC) managed reforms related to the troika loan program and provided faster executive decision-making (MacCarthaigh 2017:151), while the creation of the Department of Public Expenditure and Reform (DPER) increased fiscal discipline and strengthened the central control over the bureaucracy. In Greece, the "summit," namely a small circle of decision-makers around the PM, became a strong coordination mechanism because it was itself closely monitored by the Troika (Sotiropoulos, 2015:240). Moreover, in order to assist Greece in the implementation of reforms, the first MoU provided for the creation of a "Task Force for Greece" (TFGR).

The reform policy mix in both countries consisted of measures that are classified in three broad categories covering: organizational structures, procedures, and the civil service.

In relation to the structures and the organizational aspects of public administration, the reform included reorganization of ministries and other public entities, the closing and merging of public bodies, the reduction of units, and the reform of local government. In Ireland, the creation of a new Ministry (DPER) represented a major departure in Irish administrative history (MacCarthaigh 2017:146). Apart from assuming responsibility for public sector reform, industrial relations, and expenditure management, the DPER has been responsible for the development of two public service reform plans. Moreover, a Cabinet subcommittee on public sector reform was created, chaired by the PM, to review progress on the implementation of the reform plan (Boyle 2016a). In Greece, the General Secretariat of Coordination has been created, and together with the General Secretariat of the PM and the General Secretariat of Government it was supposed to achieve better interministerial coordination (Spanou 2015:40).

In both countries, public entities at the central and/or local level were restructured, merged, and/or abolished. At the national sublevel, a notable decrease in the number of municipalities and local authorities has occurred in both countries (MacCarthaigh 2015; Sotiropoulos 2015).

Measures aimed to strengthen the financial management for better monitoring of public expenditure, improve the operational efficiency of the public sector, and re-organize revenue administration were adopted. Both countries increased top-down procedures in budget preparation and introduced a long-term economic and fiscal framework (Spanou 2015; MacCarthaigh 2017). Steps were taken towards the use of Information and Communication Technologies (ICT) tools, E-government, and transparency portals.

Both countries introduced a series of civil service reforms to improve the operational capacity of the administrative apparatus affecting at the same time the status of public sector employees. National governments have made spending cuts the main plank of their fiscal stabilization measures. This has been addressed through seeking to reduce numbers in employment (recruitment embargo on new entrants, as well as incentivized early retirement schemes) and by straightforward cuts to nominal pay rates and to social welfare payments. New procedures have been initiated, regarding the selection of senior officers (Spanou 2015; MacCarthaigh 2015).

In summary, reforms were almost exclusively based on post-NPM ideas. Nevertheless, as the following evidence indicates, the extent to which each country followed the same road differed.

## The Impact of the Reform Programs

Both countries experienced an improvement on the financial indicators of the public sector. Over the period 2010–2018, government expenditure has decreased, revenues have increased, and government borrowing has notably dropped (% GDP).

Between 2010 and 2013, the personnel of the public administration decreased in absolute numbers in both countries. From its peak in 2008, the total number of people employed in the Irish public service dropped from 320,000 to 288,000 in 2013. In 2018, the number of employed people in the public service rose to 323,000 (Boyle 2018). In Greece, between 2010 and 2014, the total number of people employed in the public service dropped from 835,000 to 599,000. In 2018, the number of people employed in the public service was 676,000. Recent increases in both cases have shown a susceptibility to popular pressures. Agency governance followed the path of downsizing and restructuring. As at the end of 2015 in Ireland there were 257 national non-commercial agencies, down from 294 in 2010 (62 agencies were terminated since 2010 [though only 10 ceased to exist altogether] and 25 new agencies created of which 11 are completely new) (Boyle 2016b). At the same period in Greece, 31 public bodies were closed, and 157 legal entities merged (Spanou 2015).

Turning to government capacity and performance, the entry relies on indicators namely the WB Governance Indicators and the Bertelsmann Stiftung Sustainable Governance Indicators (SGI). The selected datasets aim to provide some indication on the development of key administrative variables, not a precise assessment, also taking into account margins of error when making comparisons across countries.

The first set includes three WBG indicators: Government Effectiveness, Regulatory Quality, and Rule of Law. These variables are associated with the capacity of the government to effectively formulate and implement sound policies and are linked with the goals of the adjustment/reform programs, such as effectiveness and better regulation. Ireland scores reasonably well and has improved its performance over the period 2010–2015. Since then, it is observed a downward trend, more acute in the area of rule of law implying that the issues of simplifying the complex stock of legislation and oversight which were identified before the crisis (OECD 2010:14–15) remain. On the other hand, Greece recorded the highest fall in all three areas. Government effectiveness has not really improved, despite technical assistance offered by TFGR (Sotiropoulos 2018). The same pattern is observed in the indicator concerning regulatory quality, while a notable decline took place regarding country's score on rule of law suggesting legal formalism and complexity of legislation.

The different performance is also confirmed in the set of indicators on the executive capacity of the quality of governance (Bertelsmann Stiftung SGI) which explores the extent to which a country's institutional arrangements enhance the public sector's capacity to act. Both countries have improved their performance regarding Implementation although to a different extent, while the Inter-ministerial Coordination which was already high in the case of Ireland has been improved in Greece. This probably relates to the already mentioned tendency of centralization of the co-ordination mechanisms in recent years, which is also reflected in countries' better performance relating to Strategic Planning.

## Discussion

Examining the outcomes of the reform programs several similarities and divergences can be identified. Similarities are more obvious in the cases of cost-saving measures such as rationalization of public sector organizations, improvement of regulatory capacities, shared services, performance budgeting, procurement procedures, and greater mobility of personnel across the public service.

Notable differences exist in the pace, depth, and duration of the initiated reforms. In the Greek case, the impressive list of detailed administrative reforms has not resulted in a paradigm shift for the Greek political-administrative system (Ladi 2014) but rather middle-level policy change (Featherstone 2015). Evaluation reports indicate that the initial goals were not fully achieved and a gap between programmatic statements and actual results remains. Moreover, Greece recorded the larger degree of fiscal adjustment and at the same time the largest deterioration rate in the WBG index, which could imply a reverse relationship between the intensity of the fiscal measures and the quality of governance.

In Ireland, the crisis provided a "window of opportunity" to policy entrepreneurs to address new but also long-standing policy problems related to public service reform (MacCarthaigh 2017:150). Administrative reforms were more intense and fewer deviations and discontinuities between established provisions and achieved results were observed. The 2011–2016 period became one of unprecedented change for the Irish public service (MacCarthaigh 2017:162). Nevertheless significant challenges still remain mainly in the area of delivery of improved outcomes, reform dividend, and openness and accountability (Boyle 2016a:143). In the next section, the entry examines possible explanations and offers a few conclusions.

## Explanatory Factors

Success or failure in the implementation of reforms seems to revolve around the alchemy of a small number of ingredients: fiscal pressures, reform agenda, reform capacity, external constraint, coordination mechanisms, ownership, and internal politics. The next section proceeds by considering each of these ingredients in turn.

### Fiscal Pressures

The austerity policy in Greece affected economic growth more strongly as stricter austerity targets were imposed. The fiscal multiplier, which correlates public demand with economic growth, was higher – and was underestimated by the forecasters (Domnick and Schoenwald 2016:2) – and the program experienced a true collapse in domestic demand. In Ireland the adjustment was based on fairly realistic forecasts (Pisani-Ferry et al. 2013). In this way, the external shocks from the agreement were reduced.

### Reform Agenda

In Greece, the reform agenda was admitted as "ambitious," aiming at a "paradigm change." Carrying out many simultaneous reforms under hasty and pressing conditions is a considerable challenge which raises questions of relevance and lack of prioritization and produces unintended consequences (Spanou 2018).

In Ireland, many of the reform measures stipulated in the program were taken from the already planned Irish National Recovery Plan (NRP), which meant that the government had already planned significant reforms in great detail (Pisani-Ferry et al. 2013). In this way, domestic actors approached reforms in a less formalistic way avoiding the point of hollowing out initial objectives or even accommodating reversal.

### Reform Capacity

The Greek administrative system not only had to cover a great distance but also had to be reformed while in motion and under fiscal stress. Running this reform marathon, the state machine has been deficient in its ability to deliver targeted measures on a set of priorities and according to an agreed schedule (Featherstone 2015). Reform pathologies, which were highly evident before the crisis, have also been present during the adjustment process (Featherstone 2015).

Irish administration worked rather efficiently and implemented the reforms to a great extent as agreed (Pisani-Ferry et al. 2013). The views of public servants on the effects of administrative reforms are revealing. There is a perception that the reforms being put in place are producing benefits with regard to policy effectiveness, policy coherence and coordination, cost and efficiency, external transparency, and openness and ethical behavior (COCOPS 2014:35).

### External Constraint

While the level of detail of conditionality in Ireland remained relatively constant during the program period, for Greece, conditionality became much more detailed and specific during the course of the programs as the Troika realized that implementation of conditionality was not working, in part because of the lack of specific guidance to a dysfunctional public administration (Pissani-Ferry et al. 2013).

### Ownership and the Politics of Cutback Management

The sense of "ownership" has been a key, intervening variable determining outcomes. Greek governments spent their limited political resources to implement required actions and suffered their own loss of legitimacy (Spanou 2018). In this way, the conditionality strategy was de-legitimized (Featherstone 2015).

In Ireland there has been no immediate politicization of budget decisions along left-right partisan lines (Hardiman 2010). The high degree of compliance of the Irish authorities with the agreed MoU was largely due to the fact that structural reforms drew heavily on the Irish NRP.

## Conclusion

The present entry has evaluated administrative reforms that were carried out in Ireland and Greece. Both countries have implemented an impressive fiscal consolidation and have carried out reforms in the size of public employment, the compensation of public employees, financial management systems and budget, and procurement procedures. They proceeded to a "rationalization" of the administrative system's organizational profile, though the way the two countries have embedded this goal to a systemic plan for reforming public administration is differentiated.

The divergences in the countries' reform performance suggested that policy conditionality interplays with program design, in-built constraints, setting the boundaries of the conditionality strategy. These have to do with the circumstances under which the policy mix is implemented; performance and policy targets of the program; the volume of the reform agenda; reform capacity; organizational resources; and the ownership of the program and the politics of cutback management.

The scale of fiscal stress is a necessary but not sufficient condition for substantial administrative changes. There is an interplay between external reform pressure and the endogenous administrative dynamics. In Ireland, the crisis provided the basis for a new equilibrium, while in Greece, despite notable changes occurred, no clear shift to a new pattern, can be discerned which implies that the Eurozone crisis, seems to be highly path-dependent.

## Synonyms

Attraction/retention/expansion activities; Development incentive programs; Entrepreneurship; Small enterprise development; Tax abatements

## Definition

Economic development: public, and often governmental, intervention in a market to facilitate private-sector investment and encourage job growth.

Incentives: provision of special considerations, including tax abatements, loans, or cash grants, to businesses meeting economic development program employment or investment criteria.

Business attraction: policies and programs designed to bring businesses located elsewhere to an area engaging in such policy measures.

Business expansion: policies and programs designed to grow businesses located in an area.

Business retention: policies and programs designed to keep businesses in an area that may otherwise close or move elsewhere.

## Introduction

Economic development has been defined as "a program, group of policies, or activity that seeks to improve the economic well-being and quality of life for a community, by creating and/or retaining jobs that facilitate growth and provide a stable tax base" (IEDC 2016). Economic development as a public policy concern involves the underlying assumption that institutions, and

specifically governments, matter to communities and that their interactions with and interventions in favor of certain public values, such as fuller employment, increased investment, or improved quality of life, are favorable involvements from a policy perspective.

Economic development programs may be instituted as a response to decline, including "undesirable changes, such as job losses accompanied by growing unemployment, social exclusion, physical decay and worsening living conditions" (Lang 2005, quoted in Beekmans et al. 2015, p. 2). As an example, there is a positive association between adoption of development tax credits and high levels of unemployment (Hearn et al. 2014). However, economic development programs may also be instituted to make improvements in areas that are not necessarily experiencing decline but where improvement and additional benefit is nevertheless desired: "growth of jobs, growth of number of companies and growth of property values" (Beekmans et al. 2015, p. 18). For these reasons, tax credits could also act as "reinvigorators of already developed economic, educational, and research environments" and be associated with environments that include research and development activity (Hearn et al. 2014, p. 177). Economic development policies may serve different intended functions, at various times and in distinct contexts.

While economic health of communities is a public good, the manner in which the good is achieved is open to discussion and disagreement. For their part, governments may focus on competitive advantage or instead appeal to partnering concepts and shared views of economic activity as a public good (Meyer 1991). This entry includes discussion on traditional policy approaches to economic development, emerging policy options for economic development, and a critique of economic development policy in theory and practice.

## Traditional Policy Approaches to Economic Development

Typical public policy approaches to economic development have historically included "collaboration between local governments and chambers of commerce, business surveys and calls on individual businesses, streamlined zoning and permitting processes, promotional and marketing materials, infrastructure investment, tax increment finance districts, and tax abatements" (Reese 2014, p. 627). The basic four policy strategies for economic development vary in visibility and distribution and include subsidies like tax incentives (high visibility, targeted), coordination of services (low visibility, targeted), advertising/marketing (dispersed approach, prominent), and the provision of technical assistance to businesses (low visibility, not focused on specific industries) (Feiock and Clingermayer 1992).

Attraction activities are exogenous policy instruments that rely on relocation of an existing firm from one locale to another, thus bringing "new" employment and investment to the prevailing community. These programs can be referred to as first-wave economic development programs and involved "subsidized loans or direct payments to firms for relocation expenses, tax reductions, subsidies applied to the cost of plant facilities or utilities, and competitive and expensive industrial recruitment programs" (Bradshaw and Blakely 1999, p. 230).

Retention and expansion activities, "endogenous development policy instruments" which "focus on promoting the development and expansion of indigenous firms, capitalizing on the strengths and assets of the city, and growing economic activity from within the city rather than through luring mobile capital" (McGuire 2000, p. 279), followed in the early 1980s second wave of policy. These approaches, inclusive of training, capital support to small enterprises, and use of business incubators (Bradshaw and Blakely 1999), are heavily tied to entrepreneurial activity and the support of small enterprises as potential sources of not only employment and investment but of innovation in the marketplace. Though they have been around for several decades, these approaches are arguably still emerging because they involve phenomena that remain poorly understood. Entrepreneurship is regularly taken to be an important facet of development, but more study is needed to better understand exactly how entrepreneurship of various sorts ties to development of communities or what methods of support work best for public policy purposes.

## Emerging Approaches to Economic Development

Toward the end of the 1990s to the present day, the third wave of economic development policy, focusing on community alliances and public-private partnerships, has involved "networks that leverage capital and human resources to increase the global competitiveness of a group of strategically linked firms" (Bradshaw and Blakely 1999, p. 230).

More recently, emerging policy initiatives have had a stronger focus on international development. Enhancing regional or even national-level export potential is a facet of economic development that has received greater notice, including in the developing world (Dadzie 2013). Money spent on local development may be lost to other communities, regions, or nations through leakage, and concern exists about the balance of imports compared with exports and customer spending patterns within and outside communities. Renewed attention has also been given to clusters – groupings of businesses in close proximity that are in similar or supporting trades benefit from reduced input costs and useful sharing of knowledge; this theory is generally related to the concept of agglomeration economies (Wolman and Hincapie 2015) and remains an emerging area as understanding of clustering continues to mature.

This third wave of development has also included a focus on the creative class. Creative class theory focuses on occupations and the skills and needs of creative people in a knowledge economy and eschews the industry/firm focus of traditional economic development (Florida 2014). Economic development policy has shifted to attract creative class members, with new options for that purpose being added to the economic development toolbox: "Festival marketplaces, aquariums, enclosed downtown malls, pedestrian streets, high-technology corridors, artist incubators, river walks, and casinos" (Reese and Ye 2011, p. 221). "Art spaces are involved in neighborhood revitalization and tourism activities, community outreach and arts education, and incubating artistic production" (Grodach 2011); this indicates the relationship that exists between economic development and the social-cultural well-being of communities.

## Criticism of Economic Development Policy

While economic development is normatively associated with positive benefits to communities, there is a need to focus specifically on economic development policy, from a planning and evaluation perspective. The demonstration effect that may lead to policy and the inclusion of certain incentives may be confronted with an evaluation effort; however, evaluation can be complex in practice. The gap between what a business can provide for itself and what it needs from government programs is not always clear, for example; the connection between assistance and business decisions, or resulting employment/investment, can be also difficult to quantify (Hughes 1991).

It has been suggested that economic development practice might be driven by political needs, particularly in the USA. Elsewhere there is some evidence that achievement of rational goals for economic development through technical practice could be associated with a different goal environment, one more focused on carrying out technical requirements and legislative mandates according to plan (Reese 2006). Political considerations are relevant because there is a popular sense of what economic development policy entails, and from a practical and results perspective, this sense may be false. Incentive programs to the motion picture industry, as an example, may not positively affect wages or jobs and may not pass a cost-benefit analysis (Thom 2016), though political demands may result in the offering of such incentives.

It may be that programs in a standard economic development toolbox are thought to be expected by companies, and in not offering the expected mix of incentives, communities are risking their potential to retain and attract businesses, vis-à-vis other communities. These programs are then assumed to be necessary, primarily because they are offered by others; the need for certain initiatives in a program is taken as given without a great deal of scrutiny. Because the program segments

may not readily connect with desired economic development outcomes, performance measurement of programs can be difficult. It is therefore basic that economic development programs work from logic models that connect community needs with inputs, outputs, and expected outcomes; the existence of an incentive approach in another community does not mean necessarily that the same policy will work similarly in all communities. Context matters to the business world as much as it does in government policy choices.

Some conjectures about economic development deserve scrutiny. Increasing the number of businesses in a community does not necessarily indicate a positive outcome: the mix of the businesses should suit the community and respond to its needs. Oversaturation or underrepresentation of businesses should be avoided; citizens might otherwise travel distances to get what they want, or avoid doing business locally, which can adversely impact economic development interests and hamper growth. Consideration of sustainable development is also important, as incentives might be encouraging business behavior that is unsustainable over the long term. For example, when an incentive is no longer in force, a previously attracted business might leave for a location offering a new incentive. Economic development should take equity into consideration (Blair 1995): on a block-to-block level, even within a city with a strong economy, there can be well-entrenched pockets of unemployment that adversely impact certain groups only. Some areas will clearly need more development help than others. Types of jobs created and their salaries are significant factors in economic development decisions (Florida 2014).

While various approaches to economic development are embraced in many communities, such as tax abatement policies, tax increment financing programs, brownfield redevelopment programs, and development authorities, research has openly questioned whether such programs are effective in sustaining or growing the health of an economy (Reese 2014). Specific industrial sites targeted for economic development assistance may not be the locations most in need of such intercession (Beekmans et al. 2015). Entrepreneurial encouragement is a central facet of many economic development efforts, but it is worth considering that an entrepreneurial focus, because of the skills gap it can create, "does not equalize state income distributions"; such approaches thus may not be able to "promote economies of widely shared wealth" (Young 2015, p. 281).

On the related topic of encouraging the creative class as economic development policy, it is not clear that there is a causal connection between the presence of the creative class and economic development, even though there has been more research into the topic of late (Reese 2014).

The first-wave notion of business attraction merits specific attention from a sustainability view, as the attraction of businesses to a place is a net negative to other locales. This may lend growth to one location at the expense of other places; overall growth is on par or possibly negative, depending on the repercussions to cluster businesses that had supported the departing enterprise. Expectation for incentivization may yield a softness in business's ability to withstand challenges while fostering a market of incentivization and an unsustainable bidding war on businesses between locales.

## Conclusion

The takeaway for economic development is that there are policies and programs that can help a community improve its competitiveness, increase employment and investment, and enhance its quality of life. However, economic development programs work best when they are bespoke – tailored to the community for which they are intended, through a process that involves a variety of community stakeholders, in addition to the business and public (government) spheres. Planning is a key factor, for the various levels of government working together for a common purpose and in partnership with the business community. Implementing the plan and adjusting it when it does not serve the community's needs is critical. It is a useful strategy for communities to be aware of where their strengths might lie and make best use of them.

Ideally, it would be most advantageous for government to intervene when there is a market failure where economic development incentives are concerned and where such intervention can support more efficient economies; government intervention might not help in every case (Bartik 1990). Selected programs for development should provide best benefit for cost from among the available range of intervention options. Attention to considerations that can affect economic development prospects, such as increasing educational opportunities, lowering crime rates, and providing high-quality recreational facilities, might provide more benefit than first-wave-style incentives or other methods that are assumed to work best and for all communities (Reese and Ye 2011).

Perhaps the great equalizer for economic development is that there are many considerations that go into where a business locates and numerous factors that inform the success or failure of an enterprise. From a public policy view, providing the best overall deal to a business, to stay in a locale or relocate to a new location, does not follow a simple formula. Such deals are about financial considerations, quality of life, and fit, for lack of a better term, between business and community. The "best deal" is facilitated by greatest understanding not only of targeted businesses but of the community being represented and professionals in economic development actively making the connection between the two for the benefit of all concerned.

## Synonyms

Community development; Development strategies; Economic development; Modernization; Strategic planning; Sustainability

## Definition

Economic development strategies refers to those ideas and practices that are developed to promote targeted economic growth at the local, regional, and national level according to the specific goals and values of stakeholders.

## Historical Overview

Economic development strategies in the United States have been profoundly shaped by the gradual shift from the mid-twentieth century period (1945–1975) of high growth to a longer period of overall slower growth (1975–2015) marked by limited periods of significant, but nonrecurring, bursts of acceleration in the high-tech (1990s) and real estate (2000s) markets. As Gordon (2016) demonstrates, the United States faces four significant structural impediments to sustained economic growth in the twenty-first century: rising inequality, a weakening education system, a demographic shift as baby-boomer retirees begin to reach parity with the number of active workers, and the increasing ratio of government debt to GDP. In addition, Gordon asserts both that the impact of technological innovations as economic drivers is slowing and that such innovations as already exist, such as robotics, will progressively lead to the elimination of increasing numbers of middle-class jobs (Gordon 2016; Carr 2015).

Consequently, contemporary American economic strategists have had to reconceptualize both the means and ends of development as the United States moves deep into the twenty-first century. Gone are the days of classic modernization theory (Rostow 1960) of the high-growth era of the 1950s and 1960s when the United States and the nations of Western Europe regarded themselves as the standard-bearers of an industrial modernity that other "less developed" nations were expected to emulate. Dependency theorists and other critics of this Western-centric model of economic development repeatedly underscore how the "global north" exploited the material resources of the "global south" through the imposition of burdensome debt, through the failure of many large-scale modernizing projects to deliver the promised improvements in people's quality of life, and through Western control of the knowledge and the expertise necessary to make these complex, modern systems run (Payer 1975; Scott 1998; Mitchell 2002; Harvey 2006; Escobar 2011; Klancher Merchant 2016).

Yet both modernization theory and dependency theory centers the role that governments play in defining and directing economic development. With the advent in the 1980s of the Reagan and Thatcher governments in the United States and Great Britain, respectively, and the collapse of the Soviet Union in the early 1990s, the state's role in fostering economic development was increasingly questioned and, as a matter of policy, broadly curtailed. Neoliberal critics argued that market forces, rather than government bureaucrats, should determine where economic development was most needed and that private enterprise, freed from excessively burdensome regulations, would generate development due to its ability to respond to consumer demand (Clark 2003; Harvey 2007). This neoliberal shift also reflected, and furthered, the shift from a manufacturing-based economy to one dominated by information technologies and service sector employment (Friedman 2000). The startling growth of Internet-based companies during the "dot.com boom" of the 1990s appeared to justify neoliberalism's laissez-faire approach to economic development, and during this decade the "Washington

Consensus" developmental model was exported to developing nations that promoted market-based policies including deregulation, privatization, financial liberalization, and deficit reduction (Gore 2000).

Yet, as a strategy for long-term economic development, neoliberalism and its "Washington Consensus" proved wanting. The bursting of the dot.com bubble in 2000 due to the chronic underperformance of many start-ups revealed high-tech's inability to do more than temporarily reverse the "long decline," in Robert Brenner's words, of the American economy that began in the mid-1970s with the contraction of manufacturing jobs (Brenner 2003). Following the precedent of the Clinton administration, which had deregulated banks and commodity trading in the late 1990s, the George W. Bush administration upheld the neoliberal doctrine of a market-centered approach to economic development. Yet the increasing data on wealth disparities and calamitous impacts of neoliberal policy on the developing world, including Argentina's currency collapse in 2001, started to challenge neoliberalism's rationale, if not its ideological hold on leading policymakers (Feldstein 2002; Stiglitz 2003; Arestis 2004–2005; Brown 2006). Other policy analysts grew increasingly concerned about neoliberalism's deleterious impact on democratic institutions and practices as well as its effect of attenuating social bonds (Brown 2006; Giroux 2012). Finally, the creation and the bursting of a massive speculative bubble in mortgage-backed securities in the United States in 2007–2008, and the consequent unraveling of the world economy, put paid to the predominance of neoliberalism as the reigning policy for economic development.

Significantly, the economic development strategy pursued by the Obama administration was a revived form of Keynesianism, but one more limited than that pursued by President Roosevelt in the wake of the Great Depression (Krugman 2013). The White House's proposed National Innovation Strategy of 2009, the American Reinvestment and Recovery Act of 2009, the Patient Protection and Affordable Care Act of 2010, and the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010 all represented a greater level of government intervention in, and direction of, economic development than at any time since Reagan's inauguration (National Economic Council 2009). Yet each of these measures has engendered fierce criticism and, in some cases, open defiance. Progressive critics have asserted that they do not go far enough to mitigate the abuses of, and alleviate the sufferings of those victimized by, the rampant financial speculation of the 2000s; conservative and neoliberal critics have seen in these measures a frightening degree of governmental overreach in the economy, and many of the actors affected by the new laws have successfully pushed back on several of their provisions (Pollin 2011; Krugman 2013; House 2015).

## Economic Development Strategy: Where Are We Now?

The United States in the mid-2010s, then, finds itself in a peculiar position regarding economic development strategy: thirty years of neoliberal advocacy has significantly decreased Americans' faith in their government to guide economic development effectively, yet the financial crash of 2007–2008 and the prolonged recession and erosion of middle-class jobs that followed in its wake also discredited neoliberalism itself. The unsettled state of the American polity in the mid-teens demonstrates the broader uncertainty over how the economy is to develop and regain its momentum after a lost decade of stagnant wages, low home valuations, and crippling student debt; to what extent should the government play a role in bringing this about; and what that role should be. For its part, the Obama White House continues to pursue a mixture of policies that have both statist and neoliberal implications. On the one hand, the President's 2016 economic report calls for massive public investment in national infrastructure: "there is a clear role for Federal funding and financing for projects that benefit the country as a whole" (Office of the President 2016, p. 253). On the other, the Administration has aggressively pursued the passage, through a fast-track legislative process, of

multinational trade agreements that would reduce governments' national sovereignty over business activities as a means of promoting economic growth (World Bank 2016).

Yet federal economic strategy is also occurring in a context in which the United States is facing severe structural impediments to its long-term economic development. For example, neoliberal economic policy has led to a massive transfer of wealth upward over a 30-year period and that, along with changes in tax policy, has left significantly fewer tax resources for the federal government to engage in the sort of long-term infrastructural improvements that the Obama administration has proposed (see also Piketty 2014). Moreover, there are broader economic obstacles that will hinder effective economic development policy in the medium-to-long term. Despite their recent economic setbacks, economically emerging nations like Russia and China are increasing their demand for natural resources in order to pursue their own forms of economic modernization (Jacques 2012; Klare 2012). Future technology innovations will likely not be as transformative as those in the twentieth century nor will they be in sectors likely to produce massive job creation (Gordon 2016; Carr 2015). Finally, the long-term overhang of both personal and federal debt, along with the continued transformation of the labor force into low-paid service sector employees, will reduce Americans' disposable income and, consequently, will inhibit overall demand for nonessential goods and services, further slowing economic development (Gordon 2016).

Consequently, we cannot define national economic development strategy in terms of a single dominant ethic, as we could with modernization theory in the 1950s and 1960s or neoliberalism in the 1990s. Rather, given the economic situation that the United States finds itself in, we need to consider multiple *strategies* that policymakers are employing at different levels – from the federal to the local. Moreover, we need to consider the ways in which economic development strategies are being driven by new sets of concerns, including balancing economic development with long-term environmental sustainability. Rather than provide a comprehensive assessment of all economic development strategies, we will utilize key examples to indicate that economic development strategy in the mid-2010s is characterized by multifarious approaches.

## Local and Regional Approaches

While contemporary debates rage around the federal government's role in the nation's economic development, there is much broader consensus on behalf of local and regional governments' role in the same (Liou 2003). Scholars of public administration and public policy have identified five specific reasons for government involvement in economic development: (1) concerns over market failure, (2) desire to reduce poverty and generate increased income distribution, (3) providing access to public goods (e.g., housing, education, etc.), (4) paternalism, and (5) ensuring the rights of future generations to a decent standard of life (Stern 1991). Consequently, local governmental practitioners utilize a multiplicity of different development tools that are packaged together as part of a broader strategy of local/regional economic development. These include tax abatements, tax increment financing, geographically targeted areas of special economic incentives ("Renaissance Zones"), initiatives to attract members of the creative class ("Cool Cities" in Michigan, "Create Denver" in Colorado), and specific grants to promote job creation (Reese 2014; Sands and Reese 2008). Different communities assemble different packages depending upon their region's economic situation and the particular development strategy adopted. Yet, as Reese and others have shown, the real-world results of these development strategies are often ambiguous and inconclusive. For one thing, as Reese points out, the multiplicity of different factors that go into generating economic development make it difficult to ascertain whether any given specific package of tools actually *causes* development or not. In her survey of developmental strategies undertaken by a range of different urban communities in Michigan, she found little correlation between tax abatements, tax increment financing, and

economic development, and only some correlation between Renaissance Zones, grants, and economic development (Reese 2014).

Another problem with local and regional economic development is the often "shotgun" approach that local officials take toward assembling developmental packages (Currid-Halkett and Stolarick 2011). Practitioners are not generally aware of the current scholarship that assesses the effectiveness of particular development strategies. Those who have assessed the economic impact of such "old school" approaches as tax abatements have long been skeptical of their effectiveness (Dewar 1998); in the meantime, localities have offered packages of "old school" incentives and trendier new approaches, such as attracting film production, that betray the lack of an underlying coherent strategy (Christopherson and Rightor 2010). "Practitioners," as two leading scholars assert, "must 'know their place,' which requires having the data, methods, and information that allows them to be aware of what opportunities and constraints are on their horizon" (Currid-Halkett and Stolarick 2011, p. 151).

Yet, as Harvey reminds us, economic development is an inherently uneven process (Harvey 2006). While he refers to the different developmental paths between core regions in the "global north" and peripheral regions in the "global south," it is also helpful to consider this dichotomy in terms of the variegated results of local developmental schemes within the United States itself. On the one hand, the reigning neoliberal orthodoxy of the 1980s and 1990s fostered a wave of deregulation and decentralizing initiatives that would seem to be a boon to localities competing with each other to offer the most attractive development packages to enterprises and other potential stakeholders. On the other, neoliberal deregulation and decentralization also had the effect of increasing disparities between different regions that have adversely affected long-term economic stability (Prudhomme 1995). Indeed, recent investigative journalistic accounts paint a bleak picture of local and regional governments' vulnerability to financial racketeering and consequent bankruptcy, a product of neoliberal deregulation, as they seek out funding for development schemes (Taibbi 2010).

Moreover, the transition away from manufacturing to information technologies and services, which began in the late 1970s, was accompanied by a geographical shift in capital investment from the industrial heartland of the Upper Midwest to the IT (information technology) and financial sectors of the East and West Coasts (Moretti 2013). The success, or failure, of a given locality's economic development strategy is the product of its position within the refigured geographical terrain of neoliberal capitalism as much as of the foresight and competence of the strategy planning and implementation by local leaders. Thus, economic development strategies on the local/regional level reflect the broader ambiguities demonstrated by contrasting strategies at the federal level. On the one hand, neoliberal deregulation and decentralization has enabled, and forced, localities to create economic development packages in order to attract investment and enterprises (and to defeat competition from other localities), but their success in fostering economic development is mixed at best; the efficacy of such developmental schemes is difficult to measure, and these localities' spatial position within the changing neoliberal economic order needs to be taken into greater account.

New strategic paradigms are crucial if strategists are going to manage the increasingly complex – and volatile – forces that influence economic development. There have been two emerging approaches that have attracted scholarly and practitioner interest over the past decade: the "triple helix" and the "community development" approaches. Each of these approaches seeks to broaden both traditional notions of "development" and increase our awareness of the number of actors who play a role in its creation.

## New Paradigm I: The Triple Helix Model

The Triple Helix model emerged in the mid-1990s as a way to assess the interrelationship between universities, industries, and governments in the production and dissemination of new knowledge (Leydesdorff and Etzkowitz 1996). In this model, the presence of knowledge-producing entities

such as universities and research institutes allows for such knowledge to be capitalized for a region's or nation's broader economic development. Knowledge, and especially technological innovation, plays a key role in generating economic value (Viale and Etzkowitz 2010). Indeed, policy analysts have highlighted the important role that universities can play for, specifically, regional economic development by promoting and maintaining cooperative networks and supporting the accumulation of knowledge (Pries and de Castro 1997). Consequently, the Triple Helix model seeks increased coordination between, communication among, and infrastructural development of large-scale entities and privileges these "innovation systems" as the main drivers of contemporary economic development (Strand and Leydesdorff 2013).

This model is clearly designed for an economy like that of the early twenty-first-century United States which has shifted from a manufacturing to a knowledge base. Loet Leydesdorff, the key theorist of the Triple Helix model, identifies three dynamics of the knowledge-based economy: wealth generation, novelty generation, and governance of the interactions between the first two dynamics by managers and policymakers (Leydesdorff n.d.) The Triple Helix model, then, implies that knowledge generation and the activities that surround it (including research, communication, patenting, etc.) are more central to economic development than the old manufacturing paradigm of resource extraction. Yet some have also questioned the extent to which the Triple Helix model really constructs, or identifies, a particularly new configuration in university-industry-government relations or whether there are reliable measures to assess the impact that this triangular relationship has on economic development (Shinn 2002). Even more, relationships between the three agents in this "helix" can range from indifference to adversarial, and compromises are often difficult to achieve (Mesny and Mailhot 2007). Moreover, recent research has suggested that these relationships are at risk of gradual erosion – in other words, Triple Helix partnerships may start strong but peter out, depending upon the national context (Ye et al. 2013). Indeed, the very nature of Triple Helix formations is as much shaped by the national context as it is itself a transformative agent of that very context (Leydesdorff and Fritsch 2006). Consequently, it may be instructive to see the Triple Helix as an "ideal type" to which such partnerships should aim while recognizing that all such relationships exist on a sliding scale from dysfunctional to productive and that there is no "one size fits all" that can be evenly applied to every national or regional context.

Nonetheless, there are strong reasons why the Triple Helix model can serve as an emerging strategic paradigm for economic development. It requires that academic leaders take a more entrepreneurial approach to governance and to serve as partners for regional economic transformation (Harris 2012). Implementing a Triple Helix approach, thus, makes the "knowledge-producing" entity, local industries and government agencies, and the surrounding communities shared stakeholders in economic development planning. In the early 2010s, the Kokomo branch campus of Indiana University, for example, initiated joint activities, constructed a broader regional dialogue, and sought to build stronger frameworks for cooperative actions (Harris 2011). The result was beneficial both to the campus – which witnessed increased enrollments and greater private funding – and to the broader Kokomo economy (Harris 2012).

It should be evident that Triple Helix approaches to economic development are best suited to regions with established universities and other research institutions; consequently, it privileges urban and suburban economic development over that of rural communities where such institutions may be lacking. Moreover, as the recent research suggests, Triple Helix formations require continual maintenance from among the stakeholders to keep from attenuating and their outcomes vary according to specific national and regional contexts. Finally, by privileging knowledge creation as the central economic driver, the Triple Helix model abstracts itself from the material base (metals, electrical generation, human labor) upon which all economic activity is ultimately generated. Consequently, a second

paradigm is needed, one that addresses economic development at the local, neighborhood, and community levels and that brings back in – and even centralizes – the continuing importance of natural resources to the success of economic development strategies.

## New Paradigm II: Sustainability and "Community Development"

While the Triple Helix model emphasizes the centrality of knowledge-producing institutions, and especially the role of technological innovation, for generating economic development, our second paradigm focuses on the roles that environmental sustainability and community-based initiatives have in economic development strategy. Since the 1960s and 1970s, environmentalists and social critics have raised alarms about the deleterious impacts of industrialization on local ecosystems, while historians have compellingly demonstrated the civilizational risks of prolonged environmental degradation (Carson 1962; Schumacher 1973; Redman 1999; Ponting 2007; Diamond 2011). With the increasing incidence of unusual weather activity, including the catastrophic damage left by hurricanes Katrina in 2005 and Sandy in 2012, many American communities are weighing environmental matters more heavily when considering economic development. Since the 1990s, and especially since the 1992 Earth Summit held in Rio de Janeiro, there has been a significant scholarly interest in, and practical efforts to promote, "sustainable cities" in an effort to mitigate the enormous toll that their complex infrastructures have taken on their environments (Barbier 1987; Haughton and Hunter 2003). Yet there has also been skepticism, and even pessimism, about both the imprecision of the concept of "sustainable," especially when attempting to build practical real-world policies around it, and the question of whether such complex entities as cities can ever be truly rendered "sustainable" (Lélé 1999). Nevertheless, many small, medium, and large cities have incorporated sustainability measures into their long-term economic development strategies; the challenge, as one scholar has noted, has been to build effective ways to compare and to measure their results (Portney 2013).

Thus, policymakers are caught between the Scylla of ignoring environmental stability and favoring more immediate economic gains (attracting businesses through lower regulations) which risks their regions' longer-term viability and the Charybdis of pursuing sustainability efforts that lack the necessary metrics to define success or failure and that might hinder more short-term economic gains. Consequently, while practitioner-oriented policy books have come to acknowledge the issue of environmental impacts, their recommendations either would be difficult for any government at any level to achieve – such as switching away from fossil fuels – or are too vague or too symbolic, such as adopting resolutions that recognize the importance of environmental stewardship, to make much of an impact (Leigh and Blakely 2013).

Consequently, within the past decade, alternative approaches to the idea of "economic development" have been proposed by those who are concerned about long-term environmental sustainability. One key innovation has been its reconceptualization as "community development" (Bhattacharyya 2004). Community development generally focuses on local- or neighborhood-level grassroots actions taken to create policies that promote not only environmental sustainability but that also craft a shared vision of the community's future based on the shared values of its participants (Moss and Grunkemeyer 2010). Or, in the words of two other authors, community development is a "planned effort to build assets that increase the capacity of resident to improve their quality of life" (Green and Haines 2016, p. xi). Many community development practitioners have taken an asset-based, rather than a needs-based, approach, focusing on local self-reliance and resource utilization rather than dependence upon outside entities; in this way, community development is seen as a positive response to the attenuation of social bonds that have occurred as a result of neoliberal capitalism (Putnam 2000). Many communities, in fact, have created community development corporations

(CDCs) to foster this sort of local engagement, but as Green and Haines insist, "community development" also, and significantly, takes place outside of the established channels of local, state, and federal governance, involving faith-based organizations, block clubs, and youth groups, among others. Recent assessments have shown that programs of "community visioning," in which multiple types of actors (universities, local policymakers, community members) participate in creating a shared vision of a given community's future, produced intangible improvements in residents' quality of life (French and Gagne 2010). Indeed, by expanding the very definition of "economic development" to the more capacious idea of "community development," these recent scholarly and practical interventions may point the way to reconciling development, however defined, with long-term environmental (and social) stability.

On one level, of course, "community development" is hardly a new idea. Its antecedents stretch back to the Arts and Crafts and Garden Cities movements in Great Britain in the nineteenth century to the writings of William Morris and John Ruskin and in the twentieth century, Randolph Bourne and Lewis Mumford, as well as to the kibbutzim of the settler Jews in the future Israel (Ruskin 1986; Blake 1990; Morris 1993; Near 2008). And it remains to be seen whether efforts at community development can succeed within the context of a hyper-technologized neoliberal capitalism with its growing complexity and intensifying demands for human and natural resources. Indeed, some critics go so far as to argue that such community development and other locally based efforts will succeed only when capitalist modernity has been abandoned entirely or will become themselves the basis of a simpler, more artisanal postcapitalist world (Magnuson 2013; Berman 2015). Yet these local-based approaches *do* fail to consider the ways in which large actors (universities, industries, governments) still profoundly shape economic development at every level from region and state to nation. If Triple Helix analysis ignores the materialist basis of economic development in favor of technological innovation and knowledge creation, then "community development" ideas risk eliding the ways in which complex institutional and technological systems will continue to shape the trajectory of small localities as much as big cities. Small may be beautiful but it can be a bit myopic too.

On a more practical level, however, policymakers have several strategic options when pursuing development in the face of sustainability concerns. Many communities have incorporated sustainability goals into their developmental plans, though these have generally been ancillary to the more economy-centric goals of attracting quality employers and providing traditional packages of incentives (Kitsap 20/20 2007). Indeed, such plans like *Kitsap 20/20* show the difficulties in reconciling planners' conflicting desires for environmental sustainability and localism and for attracting high-tech industries and institutions as well. Other official bodies integrate environmental sustainability targets much more thoroughly into their development plans, especially in regions that are dependent upon specific natural resources (Columbia-Pacific Resource Conservation and Economic Development District et al. 2008). What these and other developmental plans indicate, however, is that, to one extent or another, economic development strategists can no longer afford to ignore environmental concerns when considering their region's long-term viability.

## Conclusion

At every level, from federal to local, the nature of economic development planning is dramatically changing as the United States approaches the third decade of the twenty-first century. Not only have the traditional approaches of government-sponsored development been called into question by laissez-faire critics but their neoliberal solutions have been shown to produce significant disparities in outcomes as well. New challenges, like the environment and the changing position of the United States within the global world order, are forcing strategists to adjust their approaches to accommodate anticipated smaller availability of resources due to interstate competition and

environmental degradation. Like the country itself, economic development strategy and planning is in a state of agitated flux, searching for new approaches to deal with a growingly number of concerns.

# Economic Governance

Amir Mohammad Nasrullah
University of Chittagong, Chittagong, Bangladesh

## Introduction

The concept of governance is not new at all. In the literature of development economics, it has been used extensively. Nowadays, governance has

been familiarized as an operative means to connect globalization. But it is not easy to define the concept as it has diverse interrelating features. Governance is a multidimensional concept. However, in order to completely grasp the notion of governance, it is necessary to look at its all other facets, such as political, legal, economic, and corporate governance. In fact, all the diverse dimension's overlap with each other. For example, political governance has common issues with economic governance, while economic governance has inferences on corporate governance (Yilmaz 2007). Better economic governance contributes to investments, job creation, and poverty reduction, hereafter a stronger economy. Hence, the promotion of economic governance is a strategic priority for all the nations around the globe.

The aim of this entry is to conceptualize, critically analyze, and describe the concepts of economic governance in details by reviewing the existing literatures. Economic governance mainly focuses on the processes that support economic activity and economic transactions, which are carried out within institutions both formal and informal. The field of economic governance studies compares the performance of different institutions under different conditions, the development of these institutions, and the transitions from one set of institutions to another (Dixit 2008).

## Conceptualizing Governance, Good Governance, and Economic Governance

The terms governance, good governance, and economic governance are interconnected with one another. The following section tries to conceptualize those terms to recognize the nature of their links.

### Governance

The term governance is extensively used nowadays. It was first used seven centuries ago in two senses. In the first sense it meant action, method of governing; and in the second sense it included action and manner of governing. However, it has been defined in many ways in the existing literature of both the academics and practitioners literature, with varying degrees of state-centricity because of the fast-changing and interdependent global situation. In this age of globalization, no country can afford to continue with a governance system that is outdated, slow, ineffective, expensive, and corrupt in this age of globalization-situation. In this age of globalization, no country can afford to continue with an outdated, slow, ineffective, expensive, and corrupt governance system (Khan 2006).

Harlan Cleveland first used the term governance as an alternative to the term public administration. As of Cleveland, "what the people want is less government and more governance" (Fredrickson 2005). However, the use of the governance concept is not restricted to the discipline of public administration. On the contrary, Van Kerabergen and Van Waarden (2004) (cited in Fenger and Bekkers 2007) have identified nine uses of the governance concept, stemming from a wide variety of disciplines including politics, law, public administration, economics, business administration, sociology, geography, and history. "Good governance," "corporate governance," "multi-level governance," and recently even "government governance" are word pairs that illustrate the disciplinary variety (Mili and Nasrullah 2014).

As of UNDP, governance in broad terms signifies the exercise of political, economic, and administrative authority to manage a nation's affairs comprising the complex range of mechanisms, processes, relationships, and institutions through which citizens and groups articulate their interests, exercise rights and obligations, and mediate differences (UNDP 1997).

IMF (2002) described the term governance, as generally used, encompasses all aspects of the way a country is governed, including its economic policies and regulatory framework. Poor governance offers greater incentives and more scope for corruption. Many of the causes of corruption are economic in nature, and so are its consequences. Poor governance clearly is detrimental to economic activity and welfare (IMF 2002).

World Bank (1989) stated that governance is the traditions and institutions by which authority in a country is exercised for the common good. This includes: the process by which those in authority are selected, monitored, and replaced; the capacity of the government to effectively manage its resources and implement sound policies; and the respect of citizens and the state for the institutions that govern economic and social interactions among them (World Bank 1989).

Moreover, it is the exercise of political power to manage a nation's affair. It is also examined as "the manner in which power is exercised in the management of a country's economic and social resources for development" (World Bank 1992). In the World Bank's definition, "governance" encompasses the form of political regime; the process by which authority is exercised in the management of a country's economic and social resources for development; and the capacity of governments to design, formulate, and implement policies and discharge functions (Khan 2003). The World Bank's focus on governance reflects the worldwide thrust toward political and economic liberalization. Such a governance approach highlights issues of greater state responsiveness and accountability, and the impact of these factors on political stability and economic development (Mili and Nasrullah 2014).

## Indicators of Governance

World Bank (2006) presented the latest version of the worldwide public sector governance indicators. They have covered 212 countries from the period 1996–2008 which has been recognized as an effective measurement tool across the world. These governance indicators focus on the following six dimensions (Kaufmann et al. 2009).

### Voice and Accountability

Voice and accountability is the first important dimension of governance. It focuses on measuring perceptions of the extent to which a country's citizens are able to participate in selecting their government, as well as freedom of expression, freedom of association, and a free media.

### Political Stability and Absence of Violence

It is the second important dimension of governance. It focuses on measuring perceptions of the likelihood that the government would be destabilized or overthrown by unconstitutional or violent means, including politically motivated violence and terrorism.

### Government Effectiveness

It is the third important dimension of governance. It focuses on measuring perceptions of the quality of public services, the quality of the civil service and the degree of its independence from political pressures, the quality of policy formulation and implementation, and the credibility of the government's commitment to such policies.

### Regulatory Quality

It is the fourth important dimension of governance. It focuses on measuring perceptions of the ability of the government to formulate and implement sound policies and regulations that permit and promote private sector development.

### Rule of Law

It is the fifth important dimension of governance. It focuses on measuring perceptions of the extent to which agents have confidence in and abide by the rules of society, and in particular the quality of contract enforcement, property rights, the police, and the courts, as well as the likelihood of crime and violence.

### Control of Corruption

Finally control of corruption is the sixth important dimension of governance. It focuses on measuring perceptions of the extent to which public power is exercised for private gain, including both petty and grand forms of corruption, as well as "capture" of the state by elites and private interests.

However, governance has different meanings covering different agendas from political systems to corporate governance. They include political democratization, reorganization of police and the military, curing the problems of corruption, collusion, and nepotism, justice reform system, decentralization, financial management, corporate governance, and state-owned enterprise reforms.

Governance can be viewed as the sum of three major components: process, content, and deliverables. The process of governance includes factors such as transparency and accountability, while content includes values such as justice and equity (Kaufmann et al. 2009).

## Good Governance

The term good governance used in development literature implies that public institutions conduct public affairs, manage public resources, and guarantee the realization of human rights. Good governance accomplishes this in a manner essentially free of abuse and corruption, and with due regard for the rule of law (UNESCAP 2009). It means ruling justly, enforcing laws and contracts fairly, respecting human rights and property rights, fighting corruption, and encouraging economic freedom. O'Neill (2002) added, encouraging economic freedom focuses on removing barriers to trade with neighbors and the world, opening the economy to foreign and domestic investment and competition, pursuing sound fiscal and monetary policies, and divesting government from business operations. It also focuses on recognizing the private sector that creates prosperity, not central planning or bureaucracies (O'Neill 2002).

Abdellatif (2003) mentioned that good governance is, among other things, participatory, transparent, and accountable, effective and equitable, and it promotes the rule of law. It ensures that political, social, and economic priorities are based on broad consensus in society and that the voices of the poorest and the most vulnerable are heard in decision-making over the allocation of development resources (Abdellatif 2003).

However, good governance is characterized by an accountable government at the top, an independent judicial system, freedom of thought and expression, and above all, freedom of choice for its citizens. Good governance also implies a democratic structure, human rights, and freedom of media (Mili and Nasrullah 2014).

Within this broad conceptualization of good governance there are two distinct positions. Firstly, as pronounced by the World Bank, good governance is management of the resources, and affairs of a country in a manner that is open, transparent, accountable, equitable, and responsive to people's needs. On the other hand, governance is "good" when it serves not just any public interest but that of the most poor and marginalized people in society. However, over the years, good governance has emerged beyond being a value concept. Increasingly it is understood as a process that when implemented in its totality leads to sustainable development and change (Aminuzzaman 2006).

## Characteristics of Good Governance

The United Nations Development Program's (UNDP) definition of good governance is set out in a 1997 UNDP policy document entitled "Governance for Sustainable Human Development." The document states that governance can be seen as the exercise of economic, political, and administrative authority to manage a country's affairs at all levels. UNDP acknowledges the following as core characteristics of good governance, i.e., participation, rule of law, transparency, responsiveness, consensus orientation, equity, effectiveness and efficiency, accountability, and strategic vision (UNDP 1997).

### Participation

All men and women should have a voice in decision-making, either directly or through legitimate intermediate institutions that represent their interests. Such broad participation is built on freedom of association and speech, as well as on the capacity to participate constructively.

### Rule of Law

All men and women, institutions, and entities should be accountable to laws. Legal frameworks should be fair and enforced impartially, particularly the laws on human rights.

### Transparency

Transparency is built on the free flow of information. Processes, institutions, and information

should be directly accessible to those concerned, and enough information should be provided to render them understandable and monitorable.

### Responsiveness

Responsiveness means being able to respond as quickly as possible. It mainly focuses that all the institutions and processes should respond, and serve all of their stakeholders within a responsible time frame. It creates trust among the participants.

### Consensus Orientation

Consensus orientation focuses on generally accepted opinion made by a group of people. Good governance should mediate differing interests in order to reach broad consensus on the best interests of the group and, where possible, on policies and procedures.

### Equity

Equity in good governance focuses on the issues of fairness, justice and social equity in a variety of public contexts. All men and women should have equal opportunity to maintain or improve their well-being.

### Effectiveness and Efficiency

Effectiveness and efficiency focuses on the functioning of public sector based on inquiry, and liability. So, processes and institutions should produce results that meet needs while making the best use of resources.

### Accountability

Accountability in good governance focuses on answerability and expectation of account giving. Decision-makers in government, the private sector, and civil society organizations should be accountable to the public as well as to institutional stakeholders. This accountability differs depending on the organization and whether the decision is internal or external to an organization.

### Strategic Vision

Leaders and the public should have a broad and long-term perspective on good governance and human development, together with a sense of what is needed for such development. There should also be an understanding of the historical, cultural, and social complexities in which that perspective is grounded.

Nevertheless, good governance ensures the voices of the poorest and the most vulnerable are heard in decision-making over the allocation of development resources. Moreover, the political and socioeconomic priorities are determined based on broad consensus among the three stakeholders: state, private sector, and civil society. All these stakeholders are critical for sustainable human development. The state is to create a conducive political and legal environment; the private sector is to generate jobs and income; and the civil society is to facilitate political and social interaction. With the advent of globalization and the integration of economies, the state's task is also to find a balance between taking advantage of emerging market opportunities and providing a secure and stable socioeconomic domestic environment (UN 2000).

## Economic Governance

Economic governance is the nature and practice of economic management, regulation, and development or the institutional environment that constraints and coordinates economic action (Yilmaz 2007). As of Williamson (2005), economic governance is the study of good order and workable arrangements that include the institutions and organizations which underpin economic transactions by protecting property rights, enforcing contracts, and organizing collective action to provide the infrastructure of rules, regulations, and information that are needed to lend feasibility or workability to the interactions among different economic actors, individual and corporate (Williamson 2005).

Different economies at different times have used different institutions to perform these functions, with different degrees of success. The field of economic governance studies compares these different institutions. It includes theoretical models and empirical case studies of the performance of different institutions under different circumstances, of how they relate to each other, of

how they evolve over time, and of whether and how transitions from one to another occur as the nature and scope of economic activity and change of its institutional requirement.

However, most importantly, economic governance is the subset of governance activities that support and affect economic activity. Much like definitions of governance generally, the definitions of economic governance can vary, having various degrees of state-centricity. Avanish Dixit (2008) defined economic governance as the processes that support economic activity and economic transactions by protecting property rights, enforcing contracts, and taking collective action to provide appropriate organizational infrastructure (Avellaneda 2006).

## Indicators of Economic Governance

Mahani (2003) categorizes the indicators of economic governance as: macroeconomic management, investment, trade regime, financial sector management, private sector participation, and social development. Macroeconomic management indicator includes fiscal management, level of government debt, unemployment, and inflation, while investment indictor includes size and trend of foreign and domestic investments, capital flows, and allocation of resources in an economy. On the other hand, trade regime indicator includes trade orientation, export and import performance, and balance of payment position, and financial sector management indicator includes the banking sector, capital market, and exchange rate regime. Private sector participation as an indicator includes privatization and corporate governance, while social development includes income distribution and level of poverty in a country (Mahani 2003).

## Economic Governance and Growth and Development

The term "governance" has shattered from anonymity to ubiquity in economics since the 1970s. Economic governance refers to the policy and regulatory settings that governments adopt to manage the economy. It encompasses two broad areas of public policy: macroeconomic including aggregate fiscal management and microeconomic management relating to the policies that determine the private sector operating environment. Around the globe, weak economic management and corruption continues to be key constraints to economic development.

Governance as a multifaceted concept, encompasses all aspects of the exercise of authority through both formal and informal institutions in the management of resources. In other words, governance is an exercise of economic power in the management of resource endowment of a country done through mechanisms, processes, and institutions through which citizens and groups can articulate their interest, exercise legal rights, meet their obligations, and mediate their differences (Huther and Shah 1998; Gonzalez and Mendoza 2003; and Mahani 2003).

Economic governance presupposes the existence of well-defined and well-established institutional framework which is competent to undertake the implementation of economic policy laid down by the government. The institutional framework should be capable of making structural adjustment and effectively implement stabilization policies whenever required to do so. In fact, effective economic governance primarily depends on the strength of its institutional framework, the flexibility, maneuverability, and resilience to the changing political, economic, and social environment, and the ability and competence of the persons to take bold, practicable, and rational decisions. Where the institutional framework is fragile and the decision-makers are incompetent or indifferent, even the best economic policies will be worthless (Huther and Shah 1998; Gonzalez and Mendoza 2003; Mahani 2003).

Governance has assumed a more central focus. It has been given key attention not only by the officials from the United Nations Development Program, the World Bank, and the International Monetary Funds, but also from the policymakers in especially developing countries, donors; and regional organizations of economic cooperation as well as academic's community. Since the

beginning of 1990s, there is a strong indication of growing emphasis that "good governance," together with democracy and protection of basic human rights, is indispensable for sustainable economic growth (Mahani 2003).

It is impossible to achieve economic development without ensuring good governance, which is composed of competence and honesty, public accountability, and broader participation in discussion and decision-making on central issues. In addition to traditional view of governance which is on the public governance, there is also a notable increase in the endeavors to grasp the concept of governance in a multidimensional perspective which includes economic governance. The relationship between governance and development is thus studied from diverse angles, especially in the vein of economic transformation, macroeconomic management, and prevention of crisis as well as structural reforms (Mahani 2003).

Economic governance is often studied through its role in the promotion of growth. This is done by setting policies, incentives, and institutions that create an environment conducive to sustained stable growth through efficient management of a country's resources. It means managing a country's resources in a way that is accountable to and representative of the community; transparent, that is, open and predictable; and efficient and equitable in terms of the use and distribution of resources. Hence, good and effective governance requires government policies that encourage and efficiently manage investment and economic growth, support a fair and efficient public sector, strengthen the rule of law, protect human rights, and foster public participation and representation in decision-making (UN 2000).

Good governance provides key institutions and policies for the equitable and efficient allocation of resources, both labor and capital (Brouwer 2003). To put it differently, it allows an economy to yield higher growth rates by using the same amount of factors of production. The strengthened economic governance across a broad spectrum of policy, administrative, and institutional issues is now widely accepted as a key factor in rebuilding domestic and international confidence in an economy. The increase in the confidence in an economy generates more investment, which in turn leads to more production, more employment, and increased welfare (AUSAID 2003).

Good governance is also essential for equitable distribution of income. High growth rates have an impact on poverty reduction by supplying more employment to the economy, but do not have direct effects on the redistribution of income. Indeed, good governance principles are the tools to redistribute income equitably, to produce policies for the provision of public health, infrastructure, education, and other public goods and services either by directly government or by the private sector in a market which is regulated and supervised by the government.

## Relation between Economic Governance, and Growth and Development: What Researchers Say?

Many studies have examined the nexus between economic governance and growth. Huther and Shah (1998) studied the link between governance and growth. They have found that countries that practiced good governance have enjoyed high growth. They developed a governance index featuring four subindices, i.e., citizen participation index (CP), government orientation index (GO), social development index (SD), and economic management index (EM). Each of the subindices has several other components. For the economic management index, its components are outward orientation, central bank interdependence, and debt-to-GDP ratio which were used to assess trade policy, monetary policy, and fiscal policy, respectively (Huther and Shah 1998).

Barro (1999) also studied the concept of growth based on the conditional convergence hypothesis which centers on the speed of economic growth in a country toward its steady-state level. He had empirically identified that more schooling, better health, lower fertility rate, less government consumption relative to GDP, greater adherence to uncorrupted rule of law, improvements in terms of trade changes, and lower inflation all go hand in hand with faster economic growth (Barro 1999).

Furthermore, Barro (1999) identified the interplay between economic, and political development. He mentioned that there is nonlinear relationship between democracy, and growth. According to his findings, in countries with low levels of political freedom, a marginal increase in political freedom is associated with an acceleration in growth. However, at high levels of political freedom, a marginal increase in political freedom is associated with a slowing in growth (Barro 1999).

## Economic Governance Leads to the Implementation of Economic Policy

Economic governance assumes the existence of well-defined and well established institutional framework which is competent to undertake the implementation of economic policy formulated by the Government. The institutional framework should be capable of making structural adjustment and effectively implement maintenance policies whenever required to do so (Mahini 2003). In fact, effective economic governance primarily depends on the strength of its institutional framework, the flexibility, maneuverability and resilience to the changing political, socio-economic environment. It also depends on the ability, and competence of the persons to take bold, practicable and rational decisions. Where the institutional framework is fragile, and the decision makers are incompetent or indifferent, even the best economic policies will be worthless (Huther and Shah 1998; Gonzalez and Mendoza 2003; and Mahani 2003).

## Economic Governance Leads to Equitable Distribution of Income

Economic governance is also essential for equitable distribution of income. High growth rates have an impact on poverty reduction by supplying more employment to the economy, but do not have direct effects on the redistribution of income. Indeed, good economic governance principles are the tools to redistribute income equitably, to produce policies for the provision of public health, infrastructure, education, and other public goods and services either by directly government or by the private sector in a market, which is regulated and supervised by the government (Yilmaz 2007).

## Economic Governance Leads to the Promotion of Growth and Development

Economic governance is often studied through its role in the promotion of growth and development. This is done by setting policies, incentives and institutions that create a conducive environment to sustainable growth through efficient management of resources of a country. It means managing the resources of country in such a way that is accountable and answerable to, and representative of the community; transparent, that is, open and predictable; and efficient and equitable in terms of the use, and distribution of the resources. Henceforth, good and effective governance requires government policies that encourage and efficiently manage investment and economic growth, support a fair and efficient public sector, strengthen the rule of law, protect human rights, and foster public participation and representation in the decision making process (Mahani 2003).

Overall, economic development cannot be achieved without good governance that is composed of competence and honesty, public accountability, and broader participation in discussion and decision making on central issues. In addition to traditional views of governance, which is not on the public governance, there is also a notable increase in the endeavors to grasp the concept of governance in a multidimensional perspective that includes economic governance. The relationship between development and governance is thus studies from different angles, especially in the vein of economic transformation, macroeconomic management, and prevention of crisis as well as structural reforms.

However, from the above discussion, we can summarize that economic governance leads to economic growth and development in a country.

## A Model of Good Economic Governance

Economic governance focuses on the processes that support economic activity and economic transactions to protect property rights, enforce contracts, and take collective action to provide appropriate physical and organizational infrastructure. These processes are carried out within institutions, formal and informal. It ensures performance of private and public sector. But it is important to apply the principles of good governance at the state level. If all the elements of good governance are incorporated in the economic governance system of a state it becomes good economic governance.

Good governance resides on principles such as the rule of law, transparency, accountability, nondiscrimination, and participation. Economic governance is one specific aspect of good governance and refers to all rules constituting the general framework for economic activities. Implementing these rules in a transparent, predictable, and reliable way contributes to a resilient and stable economy that fosters inclusive growth, investment as well as job creation and ultimately helps alleviating poverty.

Good economic governance is crucial for the functioning of both the public and the private sector. Firstly, only well-functioning, transparent economic, financial, and fiscal policies can contribute to economic growth and sustainable development. And only strong, well-governed, and transparent public institutions can deliver their services to the population effectively. Secondly, only a transparent, efficient, and ethical private enterprise will fully merit the trust of its stakeholder and customer.

The objectives of economic governance are to create decent jobs, reduce corruption, and enhance trade and competitiveness, as well as increase per capita and better public service, the ultimate outcome of which is sustainable economic growth and development (Fig. 1).

The proposed economic governance model focuses that economic governance based on good governance principles and supported by a conducive environment can achieve the objectives of economic governance toward sustainable economic growth and development.

Existing literatures show that good governance principles such as the rule of law, transparency, accountability, nondiscrimination, and participation are important for good economic governance. Good economic governance contributes to a stable economy that fosters economic growth.

On the other hand, a conducive environment toward economic growth depends on an accountable political government, strong institutions, transparent public financial sector, and efficient private sector. A conducive environment according to this model would be helpful to achieve the objectives of good economic governance, such as, creating decent jobs, enhancing trade and competitiveness, increasing per capita, reduces corruption and poverty, and enhance better public service. Ultimately, the outcome of which is growth toward sustainable economic development.

Economic governance focuses on the system of institutions and procedures established with a view to achieving the objectives of economic policies to promote socioeconomic progress of a nation. It consists of the entire institutional framework of the government engaged in the formulation and implementation of general economic policies affecting its internal and international economic relations. It would also necessitate evolving on a permanent basis harmonious fiscal, monetary, and trade policies and establishment of a monitoring authority for effective coordination between different economic activities (Mahani 2003).

## Challenges and Problems of Economic Governance and Ways Forward

There are many problems of economic governance identified by the researchers around the globe. Creating a conducive economic environment toward economic growth is one of the major challenges of economic governance before the developing and transitional economies. A conducive economic environment is dependent on creation of employment, income equality, reduction of poverty, development of human capital, and availability of quality jobs. But developing

**Economic Governance, Fig. 1** Good economic governance model. (Source: Author)

countries as well transitional economies in the world are facing high rates of unemployment or underemployment, increasing inequality, high rates of poverty, high incidence of corruption, disruption of major economic activities due to the different natural disaster and political turmoil, low productivity due to poor human capital development, and lack of quality jobs and employment opportunities etc (UN 2000).

These problems pose serious threats to economic governance toward sustainable growth and development in many developing and transitional economies. Therefore, each country, to create a conducive economic environment, must ascertain and evaluate its stock of natural, physical, and financial resources and formulate appropriate strategy for economic growth. However, these strategies should be based on the ability for capacity building, resource mobilization, strengthening of the institutional framework, and administrative capability of the respective countries.

Positive steps should be taken to promote private sector development by creating conducive atmosphere for its nurture and healthy growth. Wherever possible, attempts should be made to encourage and foster public-private partnership and establish adequate legal and regulatory framework to provide a level playing field to both public and private sectors of the economy. The above model of economic governance may create a conducive environment to solve the problems toward sustainable economic growth and development.

Presently, the global economic environment has been changing rapidly. In this context, it is important to broaden the scope of the economic policies to include other elements, popularly known as "second generation reforms". Because, they are considered vital for economic growth, and financial stability. It may be possible in a country only if a system of economic governance is ensured. Some important suggestions based on the existing literature are listed below: (Gani 2011; Mahani 2003; UN 2000)

### Increase Spending on Fundamental Needs

Government should increase spending on fundamental needs of the people, such as, primary health and education, and adequate social protection for the poor, the unemployed, and other vulnerable underserved sections of the society. Consequently, governments should reduce extravagant and unproductive government expenditure significantly.

### Promoting Private Sector

The creation of a more level-playing field for the private sector activity is also necessary. To make this happen governments need to increase the openness, stepping up the privatization process, reducing the power of monopolies through appropriate legal and administrative measures, and setting up more transparent, and simpler legal and regulatory systems and frameworks.

### Strengthening Banking Sector

Governments should strengthen the existing banking sector. Because it can protect small savers and other depositors. It also can reduce risks for shareholders, and creditors by enforcing stricter prudential standards, and information disclosure requirements.

### Reforming Tax Structure

Tax system of the country should be reformed to make them more efficient, effective, equitable, and fairly comprehensive. It is also important to ensure greater transparency and accountability in government and corporate affairs.

These elements could be considered to constitute the basic framework of good economic governance. Capacity building for institutions compatible with a transforming economy is also very important for a pluralistic democracy, as well as, decentralization of power and good governance. The critical elements are: right type of institutions for right type of tasks, strengthening institutions to function effectively in delivering assigned tasks, developing capacity to manage institutional transition during socioeconomic transformation, and finally making sure that institutions remain dynamic, not trapped in partnership, mediocracy, and conformity. Growth will be sustainable only if institutions are strong.

## Conclusion

Economic growth is very powerful tool to reduce poverty, increase employment, and overall improve the quality of life in developing countries. In this context, economic governance matters for which political stability and effectiveness of the concerned governments are important. Therefore, it is necessary to build institutions related to economic governance in developing countries. However, institutions governing economic relations differ between nations.

The roots of research on different modes of economic governance can be traced back to the early history of research on comparative capitalism. Classical economic sociology and political economy scholarship established important understandings into the causes of divergent economic models and developments. A consensus is established that economic actions are rooted in cultural and social practices. However, the concept of governance in the context of promoting sustainable economic growth and development comprises of efficient government, effective civil society and successful private sector. Good governance is based on participatory and democratic traditions, promotion of equity and equality, gender balance and promotion of synthesis of diverse perspectives and mobilization of resources for social purposes, and in the final analysis based on the rule of law. Effective economic governance, in this context, would seek to evolve well structures, harmonious and complementary fiscal policy, monetary and trade policies and establishment of monitoring and regulatory authorities for promotion and coordination of different economic activities (Mahani 2003).

The dynamics of the current modern economy makes it necessary for developing countries to act now to improve the dimensions of governance and establish good governance practices that are internally relevant and internationally analogous and dependable (Gani 2011). The financial, fiscal and economic crisis that originated in the early twenty first century showed that financial, fiscal, and macroeconomic imbalances are strictly interrelated, not only within the national boundaries, but also at the global level. Therefore, nations around the globe should focus on ensuring a good economic governance system in order to achieve sustainable economic growth and development.

# Economic Liberalization and Governance

Md Alauddin
Uttara University, Dhaka, Bangladesh

## Synonyms

Corporate governance; Neoliberal governance; Privatization; Privatized governance

## Introduction

Economic liberalization is an idea as well as policy prescriptions inherently related to governance. Governance includes all aspects of the society, whereas economic liberalization transforms the

economic relations and institutions to achieve some desired goals. According to C. M. Chaudhary, economic liberalization is the lessening of government regulations and restrictions in an economy in exchange for greater participation by private entities; the doctrine is associated with classical liberalism. Thus, liberalization in short is "the removal of controls" in order to encourage economic development (Chaudhary 2008). As stated in Reference.com, economic liberalization refers to those government policies which promote economic growth by opening up trade to international markets, extending the use of markets, and lessening the restrictions and regulations placed on business (Reference 2017).

A broader definition is provided by *The Finance Map* stating economic liberalization is one of the most important step in economic reform. Many developed countries around the world have adopted economic liberalization through privatization. The government has allowed to privatize, partially or fully, its properties and assets. Economic liberalization is characterized by low corporate tax rates, less restriction on foreign and domestic capital, and labor market flexibility. In the developing countries, the term economic liberalization focuses more on opening their market to the foreign or national big investors (Map 2015). Considering the definitions articulated above, economic liberalization can be understood as a set of active policies supporting free market and privatization in business operation and thus relinquish government control in every sphere of economic activities and business operations.

Governance on the other hand is defined as the processes of governing undertaken by a government, market or network, or over a family, tribe, formal or informal organization, or territory through laws, norms, power, or language. It also relates to the processes of interaction and decision-making among the actors involved in a collective problem that lead to the creation, reinforcement, or reproduction of social norms and institutions (Bevir 2013).

In order to ensure proper working of economic liberalization, good governance is prior condition. Both the aspects have intrinsic linkage. To implement economic liberalization, it is necessary to mediate the governance of the imposed countries by the international organizations. The first step to liberalize any economy was the transformation of governance which started with the introduction of Washington Consensus in 1989 in the context of Latin America (Williamson 2004). Thus economic liberalization and governance have an organic linkage. It was observed in many cases that economic liberalization with poor governance negatively obstructed many economies. According to Nobel Laureate Economist Joseph Stiglitz, "The most fundamental change that is required to make globalization work is in the way that it should is a change in Governance" (Stiglitz 2003). Economic liberalization must be devoted with the good governance practices. Therefore, economic liberalization and governance work together consisting a dependency relationship to foster privatization and economic growth of an economy.

## The Linkages Between Economic Liberalization and Governance

Economic liberalization is a term that comprehends the idea of unleashing the economy from the direct government control. In other words, it is a task of liberating the economy from direct government control through removing the barriers responsible to disturb the free motion of market to let it operate independently. The central goal of economic liberalization is fostering economic growth, often which is considered as similar to economic development. Nonetheless there are differences between economic growth and economic development. Economic growth is the expansion of aggregate economic activities throughout the economy for which there is a necessity to increase the economic activities to expand growth.

Hence the basic feature of economic liberalization is to reform the social and business structure so that all barriers of business and market operation are removed or made flexible which ultimately boosts the economic growth. Liberalization policies include partial or full privatization of government institutions and assets, greater

labor market flexibility, lower tax rates for businesses, less restriction on both domestic and foreign capital, open markets, and so on. Liberalization is considered as an active measure contrary to the customary form of society which exists in its naturally given form and in a passive order. It is sometimes considered as similar to neoliberalism which has come principally from the Washington Consensus and popularized in the decades of 1970s and 1980s. The advocates of liberalism strongly support extensive economic liberalization policies like privatization, fiscal austerity, deregulation, free trade, and reduction in government spending with the view to enhance the role of private sector in the economy (Dag Einar Thorsen 2009). Emerged in a special situation of developed markets, the Consensus stresses three broad themes of liberalization which has a direct connection with transforming governance. First, it elevates the role of markets in economic governance and in mediating flows of goods and capital. Second, it enhances the role and scope of the private sector and private property. Finally, it promotes a particular notion of sound economic policy including balanced public budgets and flexible labor and trade markets. These policies include reformation in both public and private governance. Advocates contend that these policies represent the only path to economic prosperity in an increasingly interconnected world economy. Those policies help in macroeconomic stability and reduce pressures from the government. If the government is allowed to work beyond business and rather regulate the business then both from the business and the government perspectives, they can walk on their own way to stimulate growth of the economy (Banuri 1991).

We see that the growth of the economy is a function of economic liberalization and governance both work as complementary to each other. In this context, governance has gained overwhelming popularity through the active policy suggestions of World Bank and International Monetary Fund (IMF) starting in 1970s with the view to help functioning the forces to achieve economic development although governance was not a new idea in the sphere of public administration. But, this time governance got a new dimension called normative governance. The argument for ensuring normative governance as "good governance" for higher growth has established governance both as a cause and outcome of economic growth.

Governance has become the key player to ensure economic liberalization. It is undoubted that without looking into the core aspects of governance, the *modus operandi* of economic liberalization and its implementation cannot be achieved. Governance can exist in many forms like the central government of a country, whose sole responsibility and authority is to make binding decisions in a given geopolitical system by establishing new laws. Inside the territory there may exist multiple governance working under the defined laws of the central government. It can take the form of an organization, a sociopolitical group, or another informal group of people. Whatever form the entity takes, its governance is the way the rules, norms, and actions are produced, sustained, regulated, and held accountable. Some common forms of governance are public governance, private governance, global governance, corporate governance, etc. There are also normative concepts of governance like fair governance, good governance, and so on. One of the common assessment indexes of good governance is Worldwide Governance Indicators (WGI) developed by the members of World Bank and World Bank Institute which is based on six dimensions: voice and accountability, political stability and lack of violence, government effectiveness, regulatory quality, rule of law, and control of corruption. This indicator has finally included peace and security, rule of law, human rights and participation, sustainable development, and human development (World Bank 2009). Another related concept, mentioned earlier, is neoliberalism. The term is a thorough version of economic liberalization, which means the extension of market relations and competition throughout society, including the realm of social interactions. It is defined as not an ideology, nor a policy, rather a governmentality for advanced liberal societies, a set of governance practices which, as a political rationality, also endeavor to impart sense to those practices (Larner 2000).

In whatever form it exists, the basic spirit of normative governance lies in its economic and business logic. Primarily the structure of an economy defines its governance apparatus. Further, the governance pattern of the economy also influences its overall performances in different spheres of social and economic life of a society. The indicators for good governance are set in a way that it serves the purpose of economic liberalization. Good governance must be ensured to get the fruits of economic liberalization. Thus economic and financial liberalization has to be combined with the overall transparency of the economic and social system. It is found in study that economic liberalization with poor transparency has a higher probability to fall in economic crisis than that of the economies which are not liberalized (Kaufmann 1999). It is evident that economic liberalization has direct relation with the complete governance of an economy. More specifically, the idea of normative governance is fueled by the transition of business pattern around the globe suggested by the consensus. In 1970s, governance and government got their distinctive meaning with the pace of economic liberalization started with great deal demanding with the drastic transformation in the governance pattern of an economy. Indeed, the success of a liberalized economy is highly dependent on the quality of governance in that economy. Hence the focus on governance or more specifically good governance can be seen as a direct policy outcome of economic liberalization.

## Theoretical Debates

Economic liberalization is based on the idea of active use of freedom: the role of the liberal state is to secure proper conditions for markets to function instead of letting them operate freely as classical liberalism urges. The main elements of liberal governance are support for free movement of goods, people, and capital, redistribution of authority between governmental and non-governmental entities, pro-market regulation, and an emphasis on social innovations that will advance individual freedom and responsibility (Philip and Cerny 2005).

The philosophical basement for liberal governance was emphasized in the arguments of French Economist Frederic Hayek and Milton Friedman. Hayek thought that information is the key instrument of governance but which is not accurately available to the governing forces. He believed that no individual (or group, including the government) could ever understand everything about an economy or a society in order to rationally design the best system of governance. He argued this only got worse as scientific progress increased and the scope of human knowledge grew, leaving individuals increasingly more and more ignorant in their lifetimes. As a result, he believed it was impossible for any person or government to design the perfect systems under which people could be governed. The only solution to this, he believed, was to allow all possible systems to be tried in the real world and to allow the better systems to beat the worse systems through competition. In a liberal society, he believed, the few who used liberty to try out new things would come up with successful adaptations of existing systems or new ways of doing things. These discoveries, once shared and become mainstream, would benefit the whole society, even those who did not directly partake of liberty (Hayek 2006).

In the neoclassical economic theories, government intervention is not welcomed until and unless market cannot operate by its own force, the case sometimes called as market failures. Market failure may be resulted from externalities, dynamic rigidities, market power, market concentration, missing markets, information asymmetry, and so on. Intervention in such a situation is justified when the benefit of intervention is greater than the cost of such failures. As the developed country academicians argued, most of the developing country market cannot operate independently because either the market is not developed or the government control is such that the market cannot develop with its own force (Bertucci 2003). So it is desired that the government will formulate some key rules and regulations based on which the market will operate

while the government itself will not participate in the market.

## Conclusion

Economic liberalization has been imposed as a form of policy reforms and used as a condition for foreign fund and assistance by the international institutions to the developing economies. The idea came into policy through the reformist suggestions in the governance of developing countries. The impact of such imposition was not always free from difficulties rather ensuring good governance measured by efficiency has created more problems than benefits. The historical and cultural setup of a society is not considered in neoliberal governance which sometimes leads to crisis of the system. The Latin America and Southeast Asia's examples of political and financial crisis are good reminders. But it is well established by the experts and policymakers that economic liberalization which has come up with essential governance reforms can accrue the benefit of its development goals. In order to ensure the benefit, governance stands as a key factor. Therefore, good governance is considered a staple condition to get the benefits of economic liberalization. Otherwise, such liberalization without governance is going to contribute anarchy in the society and will give ample advantage to a particular class of people. It has been estimated that economic liberalization without ensuring good governance often creates anarchy in the financial sector through collapsing the economy.

# Economic-Administrative Systems for Local Development

Dragos Dinca and Ani Matei
Faculty of Public Administration,
National University of Political Studies and Public Administration (NUPSPA),
Bucharest, Romania

## Synonyms

Integrated homogeneous development; Metropolitan development; Regional development; Urban development

## Definition

Local development relies on the existence of a regulatory-procedural framework, a partnership, a development strategy, and resources so that it involves taking into account the legal framework (external environment), an inventory of the resources, as well as partners/stakeholders who can be mobilized and their aspirations/expectations. All these are ordered in strategic planning documents. Progress is measured based on results assessment.

## Introduction

Local development aims at economic prosperity and social welfare by creating a favorable environment for business, while integrating vulnerable groups into the community, using endogenous resources and the development of the private sector.

This can be understood as a complex process of increasing well-being, by concerted actions of local, regional, national, and European actors (Barca et al. 2004), actions aimed at environmental protection, social development, economy, spatial planning, education and training, science and research (Dinca and Dumitrica 2020), and setting out primarily from the potential of that territory.

The definition of the "local" concept is given not only in connection with the administrative-territorial units, commune, city, municipality, or county, but also at inter-municipal, interregional, and even cross-border level" (Matei 2004).

Under this framework, local development considers the evolution of the capacity of a local or regional economy to stimulate a strong economic and social growth meant to create new jobs and circumstances to capitalize on opportunities for rapid economic, technical, and social change (Matei et al. 2009).

Local development is considered an economic and cultural scope of decentralization, diversifying and enriching activities in a given territory by mobilizing existing resources and energies in the area. The outcome of the efforts of a population means the implementation of a project of economic, social, and cultural development (Xavier 1991).

Therefore, local development is a complex process, dominated by evolutionary aspects of various kinds – economic, technical, social, or administrative.

## Local Development

Local development, as a complex process of increasing well-being with contribution from different stakeholders, is at the same time economic, social, and cultural. Any development project must take into account the traditions, customs, and culture that the locals share. The aim is to create a climate of equity by fighting poverty and promoting individual identity in great diversity. It also envisages the elimination of forms of discrimination, in particular through the focus on disadvantaged groups. In general, we can talk about human development and strengthening individual capacities through education, adherence to ethical values, and social development that take into account social and cultural relations as well as citizens' participation in the decision-making process of public authorities (Matei and Dinca 2002).

Local development is achieved by the joint efforts of the public, private, and civil society sectors. The influence of the government is strong and consists in ensuring macroeconomic stability, regulating the national legal and institutional framework, as well as income distribution.

The local public administration is considered to be the main development agent, playing a decisive role in ensuring the leadership and funding the urban development process. The private sector is another important agent of the process, representing the most important source of jobs, investments, and project financing. Civil society (NGOs, the media, church representatives, and trade unions) plays an important role in identifying problems and participating in setting the strategic directions. Citizens are an important stakeholder in local development. The relationship between local authorities and the citizens they serve is the most important factor in

assessing local democracy. This relationship depends very much on the experience of both parties and their desire to collaborate. Local development is a process of growth and amplification accompanied by a series of qualitative transformations generated by the application of strategies, policies, and development programs.

Local development policy is a set of integrated measures (national, regional, and local) (economic, social, cultural, environmental, transport, and security). The elaboration of development policies aims to improve an existing situation, eliminate dysfunctions, and consolidate development directions.

Local development is a complex phenomenon that affects the entire economic, social, political, and cultural life of the locals and must take into account areas such as:

- Environment protection
- Social development (employment, health, safety, housing, and social protection)
- Local economy
- Government and institutions
- Spatial planning, urbanism, transport infrastructure, and public utilities
- Education, training, science, and research
- Culture, cults, sports and leisure

The preconditions required to start a large process of local development lie in a strong wave of local solidarity, meant to reflect the will of the majority of the local community to capitalize on their own development resources in a local economic system, the main objective of which is to increase revenues, combating unemployment, as well as improving infrastructure.

Thus, the relationship established between the local economy and the ongoing local development process is the kind of part to whole interdependence, the local development cannot exist in the absence of local economic-administrative mechanisms, meant to support local development strategies, and implicitly to ensure practice of all the elements that make up the process of local development.

The specialists' preoccupation with local development and the very complex nature of it prompted over time the use of various expressions such as the one of local development and community economic development, or rather – taking as reference the hybrid phrases such as the concept of "local development body," or the one of "sustainable community development" or the one of "community local and economic development" – to characterize the efforts to capitalize the resources located at local level (Profiroiu et al. 2008).

Local development, being at the same time economic, social and cultural, cannot be conducted in the absence of a cultural dimension, of a project that mobilizes local resources based on capacity, traditions and experiences (Xavier 1991).

## Local Development Differs from Traditional Development Strategies by Emphasizing Endogenous Resources

Local development must be based on the human, financial, material, and informational resources existing in the community, using them as the starting point and keeping in the foreground the human resource and its creative potential, the state and local authorities are directly responsible for creating development mechanisms at local level.

The process of local development (Fig. 1) can be seen as a transition of a community from state A to state B, by the concerted influence of development stakeholders over all areas of development, fitting in all components.

## Concepts and Theories of Local Development

### The Neoclassical Conception

The neoclassical conception focuses on the individuals and the companies, and, respectively, their behavior being used "frequently to analyze the growth schemes observed at regional level" (Borts 1960).

Neoclassical theory starts from the idea of a world in which competition is perfect, factors of

**Economic-Administrative Systems for Local Development, Fig. 1** Components, actors, fields, and processes of local development. (Source: Dinca 2008, p. 169)

production are extremely mobile, and profits and utility are maximized to explain why regional growth is the outcome of different forces. These forces balance out in competing on the regional markets of goods and production factors.

## The Keynesian Conception

Keynes's general theory sought to find practical solutions to alleviate or even remove imbalances and revive the economic system as a whole, based on the reported and in many respects explained dysfunctions in the economy (Raicu 2003). The most important aspects of the new approach to economic phenomena refer, on the one hand, to the quantification of overall economic relations, and on the other hand, to the elaboration of policies on the regulation of balance relations (Prahoveanu and Matei 2004). The Keynesian model of a local economy takes into account the causal relations aimed at ensuring the economic balance on the goods and services market (Matei et al. 2009).

### The Monetarist Conception

The monetarist conception based on Milton Friedman's theories presents new dimensions of economic thinking on the processes of local/regional economic growth. It tackles the relative efficiency of production and the speed or weight with which local, regional economy adapts to change, the ease with which a region can create its own markets (Dinca and Dumitrica 2020).

### The Theory of Unequal Development

The basic idea of development theory as a chronological differentiation was put forth by the Nobel Prize winner for economics Gunar Myrdal. He believes that the growth process is essentially and permanently uneven. Through its amplifying effect, the endogenous increase of incomes creates differences between zones and regions, which lead to the appearance of a process of cumulative and circular causality. This theory brings into question the issue of homogeneity of economic time, development gaps being interpreted as chronological gaps.

### Growth Poles Theory

Economic growth, according to François Perroux, is not homogeneous, while geographically it is concentrated around key companies, manifesting themselves in growth poles that have a variable intensity, spreading through various channels with variable effects on the whole economy.

The notion of polarized space denotes "the set of forces of attraction and repulsion that an economic unit exerts on goods and people in geometric space and the set of forces of attraction and repulsion that are exerted on itself" (Perroux 1954).

### Input-Output Theory

Local development depends on input-output links, goods and services exchanges, as well as labor force that are set both inside and outside a community (Matei 2007) and is based on Leontiev's ideas. This theory has generated two other approaches: the theory of endogenous development and that of exogenous development (Dinca and Dumitrica 2010). The first of these aims to maximize internal factors, and the theory of exogenous development aims to analyze the impact and influence of the external economic and governmental environment on a local development system, aiming to achieve a homogeneous local development focused on the development of an innovative space.

### Minimal Risk Theory

The risk in the process of local development is represented by the failure to achieve the objectives undertaken or the inability to move from virtual to real development. In this context, risk can be defined as representing a "potential adverse deviation from expected results" (Kuritzkes and Schuermann 2007).

Authors such as M. Blaug and F. Knigt suggest that risks can be calculated. Therefore, the theory of minimal risk in the process of local development involves identifying the risk, calculating their probability and impact, and assessing risk tolerance and formulating risk responses. Real local development is, according to this theory, a sum of processes with minimal risk (Dinca and Dumitrica 2015). According to the authors, the stage of virtual development can be affected by a number of elements: political and legislative risks; lack of predictability of government activity; risks generated by late application of strategic planning documents at national/regional level; misunderstanding the usefulness of development planning; lack of continuity in development planning; cumbersome, unclear planning guidelines; planning formalism; inability to collect data; erroneous data; ignoring data/information; not involving groups into planning; lack of representativeness; inadequate local culture of public participation; unprepared human resources; lack of financial resources for planning; limited forecasting capacity; unrealism in planning; reduced innovation capacity; lack of correlation with national/regional/zonal programs; technological risk; and nonexistence of a homogeneous integrated approach.

The actual development or implementation stage of development projects, in turn, can be affected by a number of risks/factors such as: governmental, legislative risks, unforeseen events, labor migration, urban explosion, human

resources, financing, low predictability, image risks, corruption, lack of public support and involvement of groups, technological risks, and inability to implement and monitor development projects.

### The Theory of Local Development Oriented on Production Factors

Local development oriented on production factors relies on the basic economic resources (Matei et al. 2009), such as natural resources and labor force. The development model can be based on an aggregate production function of the Cobb-Douglas type (Douglas and Cobb 1928).

In a variety of papers on the topic (Dinca and Dumitrica 2020) a number of development models such as the Von Thunen model, the Weber model, the Hotelling model – the location interdependence theory, Crristaller's model – central place theory, and Losch's model or Zipf's model are also presented. However, in relation to the many theories and models that seek to highlight the process of local development "one of the most important restrictions is to ensure the data required for parameters estimation" (Matei et al. 2009).

## Systemic Approach to Local Development

Local development is the result of the interaction, at local level, of the economic and administrative fields. Processes related to local development are subsumed or superimposed on adjacent processes aimed at "decentralizing public policies to regional and local administrations, cooperation and networks between different levels of government (local, regional, national, supranational) and between public and private agencies" (Barca et al. 2004). From this perspective, local development is a system, that is, as Lapierre pointed out, "an organized set of processes linked together by a set of interactions, coherent and flexible, which determine a certain degree of autonomy" (Lugan 1996).

The administrative systems characteristics were reviewed by authors such as Mehl (1957–1964); Guţu (1984); Chevalier (1986); and Matei (2002, 2003). Also, economic systems were the subject of careful consideration by Scarlat and Chirită (1997) and Paun (1997).

The systemic perspective of local development can be found in Lemieux (1972) – the systemic study of the relations between politics and administration is being scrutinized by Landry and Lemieux (1978) – with reference to the analysis of local development policies within government policies.

Lemieux (1972) analyzes the relationship (Lemieux 1972, pp. 66–67) between politics and administration, locating political and administrative subsystems within the global social system, reaching a "cyber presentation of governmental phenomena" inspired, in large part, by Mehl (1966). The diagram shown in Fig. 2 highlights the existing connections and relationships.

Lemieux's theory (1972) is developed in a systemic three-level model, (Landry and Lemieux 1978, p. 532): the *selector* (S) will elaborate action norms that will define the own activity of the *transducer* (T), which will ensure an active interface between norms and practices, in a bidirectional connection. The lower level (E) is intended for practices designed to ensure compliance with the rules and regulations set by the selector.

Decleris (1989) deems that public administration is considered "the most important processor of value demands (inputs) in the system of government, demands that vary in relation to social complexity. Such value demands are generated by public problems, and their processing represents a type of quantitative and/or qualitative conversion, achieved through a series of public decisions" (Decleris 1992, p. 150). Based on this finding Decleris proposes a model for public policy development (Matei 2003).

Buckley (1967) proposes a complex model of governmental organizational systems regulation, which requires the connection to the environment, an application with a certain cyclicality, and corrective measures to avoid or mitigate possible errors (Buckley 1967, p. 173) (Table 1).

Based on the three models, the authors draw a series of conclusions regarding the systemic

**Economic-Administrative Systems for Local Development, Fig. 2** Lemieux cybernetic scheme of the governmental organization. (Source: Matei et al. 2009, p. 19)

**Economic-Administrative Systems for Local Development, Table 1** A comparison of the systemic characteristics of local development models is proposed by Matei and Matei (2007)

| Level/ model | Level I | Level II | Level III | Feedback |
|---|---|---|---|---|
| Landry-Lemieux | Selector | Transducer | Producer | Performance measuring and comparison |
| Decleris | Policy development | Public processor | Public policies | Filter and control |
| Buckley | Control/decision subsystem | Exits/decisions over development parameters | Selected policy | Output effects and feedback testing |

Source: Matei and Matei (2007)

analysis of local development, which are hypotheses of the systemic, economic-administrative model of local development (SEADL):

- The existence of three levels of systemic organization: *selector*, *transducer,* and *producer*, each of which has the characteristics of a cybernetic subsystem
- In local development the activities corresponding to the first level belong to public institutions or authorities (county, municipal councils, etc.) or to their associative structures and have as object the substantiation of public decisions regarding local development strategies, selection of public development policies, accessing development funds, etc.
- The intermediate level – transducer – includes activities carried out by public employees for the operationalization of public decisions, monitoring the implementation of local development policies, evaluation of their outcomes, and of the social and economic impact

Following two levels are specific to the local public administration and ensure its role as a public processor.

- The basic level – producer – overlaps with the activities of economic agents of local development made up into a network of cybernetic subsystems which, as a whole, also has its own adjustment mechanisms

- The design of a SEADL must take into account the logic of action of local development presented above, a logic that combines the efficiency of economic processes of local development with the public interest of local communities

Therefore, the assumption that SEADL will consist of two main subsystems, administrative and economic, which interact through complex mechanisms arising from the legislative framework, the transfer of resources, and information. Their environment is the same and they make, with each one, specific connections arising from the public interest, the need to increase welfare, etc. The result is the economic-administrative system of local development (SEADL) (Fig. 3).

**Economic-Administrative Systems for Local Development, Fig. 3** The architecture of the economic-administrative system of local development (SEADL). (Source: Matei and Matei 2007)

This model actually describes the stages of the planning process development: socioeconomic analysis, identification, formulation, selection, and implementation of appropriate development policies. Moreover, it describes the reciprocal links between development actors and the interdependence between them.

## Conclusion

This paper presents an overview of the theoretical and practical concerns of theorists on local development, a complex process focusing on individual and collective well-being. In the current context in which more than 50% of the world's population and 65% of Europe's population live in cities and the World Bank predicts that by 2050 the number of city dwellers will double, almost 7 out of 10 people worldwide will live in urban areas, therefore the issue of local development is as much as ever a very pressing and relevant issue.

Both the perspective of quantitative and numerical growth, a phenomenon that seems irreversible in the context of the system of values and principles of current civilization, and the qualitative perspective are targeted. The population migrates to large settlements for economic reasons, in search of well-being, individual fulfillment, and happiness.

Although much research on happiness has brought to the forefront the nonfinancial component and the fact that elements such as loyalty, civic involvement or intrinsic motivation are important to people (Bruno and Stutzer 2002), the economic component still seems to override the rest.

The systemic model proposed shows a global, comprehensive picture of the stages and interactions that must be taken into account in the strategic and operational design of local development.

# Economy and Nonprofit Sector

Joshua O. Odetunde
Walden University, Minneapolis, MN, USA

## Synonyms

Economic development or macroeconomic development; Equitable allocation or equitable distribution

## Definition

*Essential goods and services* refer to those material things needed for individual well-being considered necessary for the average living standard condition within particular economy. *Economic development* refers to all governmental activities for equitable benefit of people in the constituency.

## Introduction

A clear concept of the nonprofit sector is needed in every economy rather than being assumed to be the consequence of market failure for charitable assistance in terms of supply and demand. Nonprofit sector is an economic force phenomenon resulting from social and market activities in the public and private sectors of the economy. It is this economic force of the phenomenon that enables development strategies to have equitable impacts on everyone in any nation. The economic force is less recognized and generally assumed because market and social transactions using money as the medium of exchange within an economy are inextricably interwoven (Gillette 1994). People need the nonprofit, private, and public institutional sectors in every economy. Partnerships with organized nonprofit sector institutions are indispensable for socially just administration of public policies and fair practices in private sector institutions. Not all valuable economic goods and services are being used and provided in terms of straight forward demand and supply.

Nonprofit sector institutions neither have to be private nor government agencies but voluntary and transparent enough to be recognized. However, differentiating institutionalized nonprofit sector from other two institutional sectors is critical because governments normally seek to ensure equitable allocation of goods and services that are essential for individual livelihood. Due to the need for public accountability, however, not all essential needs of every individual person can be met with coercive redistribution of wealth through taxation or even comprehensive rules and regulations in the public sector (Swanson et al. 2014). Some essential needs are systemic economic concerns that may propel innovative organizations as in for-profit business entities. That is, those systemic economic concerns cannot be addressed by public agencies without governments traversing into charitable private social life of people as individuals. Therefore, people need the unique intermediary role of nonprofit organizations to freely and transparently exchange some essential goods and services through market activities for charitable expressions among themselves.

## Economic Development and Social Justice

With the foregoing economic force concept, the focus of market-based activities in the third sector of the economy is to ensure equitable allocation of

essential goods and services by linking public and private economic activities. The linkage is needed as governments around the world are faced with the risk of socioeconomic instability (Swanson et al. 2014). Equitable distribution of essential goods and services for improved living conditions of people is needed for safe, stable, and just social environment. Market-based ideological reforms of public service administration are not based on social diversity or social norms but on the assumption of relatively free market-based activities among individuals and various establishments or institutions within the economy. Money has become the common objective means of exchange in these market-based activities, while prices of goods and services are largely determined by supply and demand (Whelan 2016). While taxes may promote economic efficiency in terms of supply and demand, taxes do not ensure equitable distribution of essential needs for improved living conditions of people. Therefore, the normal link of public and private economic activities in form of nonprofit institutions is still needed even with value-added tax systems, particularly for equitable distribution of essential goods and services.

The democratic processes of governance usually involve formulating public policies adaptable to particular social environment resulting in the uniqueness of the economy of each nation. Thus, in every market economy, governments have to rely on the rule of law due to social diversity and macroeconomic forces of fiscal development strategies including the nonprofit sector for public administrators to evolve public policies based on the assumption of relatively free market activities among individuals (Steiner 2013). The nonprofit sector impacts are taken into account because macroeconomic forces usually result from such market-based activities and various social interactions along with direct enforcement of law and order while goods and services are being allocated among people within the economy. Therefore, improved living conditions of people are inextricably interwoven with various market-based activities and their social interactions with one another.

Also, to ensure social justice, the output of communal efforts and natural resources of the economy have to mutually and equitably benefit people who are individually aspiring for improved living conditions. Therefore, the government of each nation has to ensure those essential products are being equitably distributed through market-based activities among individuals. Public policy intervention is necessary because unlike centralized objective in communal activities, market-based activities largely rely on private individual agents freely exchanging goods and services with desire for personal achievements while competition modify their profit incentives (Steiner 2013; Odetunde 2015). These processes of transforming communal efforts and resources into products for market-based distribution using money as medium of exchange need to be clearly understood for at least two reasons. First, goods and services are being exchanged with money in various forms of market-based activities within any economy not just for their direct consumption utilities but for monetary profits or other personal incentives. Secondly, there are various quantitative functions of money in the financial processes of exchanging good and services in a market economy. Hence, economic transactions in terms of buying and selling distort social interactions. The distorted relationship dynamics increases the complexities of equitable distribution of essential goods and services for improved living conditions.

The common assumption is that taxes take care of equitability issue in the distribution of essential goods and services. While various forms of taxes, public insurance, user fees, sliding scale allocations, and various other rules or regulations are prevalent public policy instruments to ensure equitable market-based allocation of some essential goods and services (Lascoumes and Gales 2007), the nonprofit sector remains indispensable to ensure social justice. Thus, the concern in allocating goods and services in developed economies is less about scarcity as it is about equitability due to the introduction of money into their economic environments. This macroeconomic phenomenon in market-based distribution of essential goods and services actually raised the economic issue of horizontal equity and vertical equity (Berliant and Strauss 1985). Vertical equity issue arises

because besides the communal natural resources, some essential goods and services will always have to be produced through communal efforts. On the other hand, to ensure social justice, some essential goods and services will always have to be allocated to meet individual need for survival or improved living condition as opposed to individual financial means in terms of income distribution among the people of the particular constituency.

The proportional macroeconomic impacts of the nonprofit sector on this vertical equity in market-based distribution of goods and services could differ from one country to another. The differences could be due to the constellation of social forces and the structure of the country's economy giving rise to the sector. However, those impacts are certainly not negligible and cannot be ignored. Since money is only valuable as a medium of exchange, failure to encourage nonprofit sector impacts could result in social injustice of market-based public policies that are enriching only some individuals money-wise. It could also result in wastes or mere growth in money market without equitably improving living conditions of people in various constituencies even in developed economies. This logical reasoning is compounded if confused with political discussions about government spending particularly in the United States that is the most advanced capitalist economy.

Public policy in the housing market in the United States illustrates the foregoing vertical equity issue. In a case study about engaging the nonprofit sector in the local housing market, Odetunde (2015) suggested social entrepreneurship to complement public policy in addressing the vertical equity issue. The community nonprofit real estate management approach is suggested to preserve such vertical equity in the form of home equities for mutual benefits so that low-income households can also invest in their homes in local housing markets. It was pointed out in the dissertation that various subsidy programs to complement public policy in the housing market have led to institutionalizing the ambivalent distinction between market rate and subsidized housing units in the nonprofit sector in the United States. The distinction is ambivalent because landed tenure and bundle of rights determine allocation for investments or leaseholds as opposed to buying and selling of consumable goods in local housing markets. Therefore, low-income households should not be perceived as consumers or beneficiaries of entitlements. It is public policy administration that led to confusing rental subsidies with mortgage assistance programs to leverage homeownership. Low-income households are not benefiting from possible innovative and competitive leasehold arrangements among households in their local housing markets. They are inadvertently excluded as active participants in the mortgage-leveraging feature of the larger context of the housing market.

Furthermore, low-income households are inevitably restricted to rental housing to meet their needs for shelter as opposed to participating in the nonprofit communal effort of leveraging one another in the capital asset market for housing. It is not commonly understood that housing finance system in the United States actually evolved from communal arrangements of leveraging one another. It is not a common knowledge that, historically, the mortgage-leveraging feature of the housing market transforms the communal effort to market-based activities in the United States (Odetunde 2015). The vertical equity impacts of this transformation on the well-being of individual household in America are currently being underestimated by inadvertently excluding low-income households as active participants. It can be reasonably inferred that vertical equity has not been differentiated from horizontal equity (Berliant and Strauss 1985) in market-based activities for housing. Although the informal communal leveraging efforts have been transformed into financial intermediation systems, low-income households are excluded as active participants by being largely restricted to rental housing market and housing subsidy programs as consumers.

In-depth studies of communal efforts in other major economic sectors for essential goods and services could similarly reveal that the nonprofit sector is an indispensable part of the

macroeconomic forces of every nation. Those communal efforts are integral part of the economy necessitating partnerships with nonprofit sector institutions for public policy formulation and implementation. However, the economic forces of the nonprofit sector cannot be clearly differentiated because they are intertwined with for-profit microeconomic activities in the private sector. That is, the boundaries of public, nonprofit, and for-profit private sectors are not clear even in market-based economies. The boundaries could be considered to be shifting and waning (Ben-ner 2001) because it is commonly assumed that for-profit and nonprofit establishments are clearly distinguishable by profit motives. However, in market economies, the need to differentiate is not about profit making but about how to distribute profit (Salamon and Sokolowski 2016). Considering the complexities of today's developed economies and various technological advancements, the nonprofit sector is best described as the sector for production and allocation of essential goods and services in the gray area between private sector and public sector in the economy of each nation.

Attempting to define the gray area, however, could result in artificial distinction between charitable social and economic activities resulting in significant economic forces for individual well-being. At the same time, those resulting economic forces on individual well-being cannot be ignored to ensure social justice. Nonprofit organizations not only play unique intermediary role among citizens but also among various private and public institutions to ensure equitable distribution of resulting essential economic goods and services. Therefore, the nonprofit sector complements public policy as an integral part of the economy of every nation to ensure social justice. Although nonprofit sector institutions serve some common good or public benefits, they remain voluntary private initiatives that should be encouraged to ensure social justice (Salamon and Sokolowski 2016). Public control of nonprofit sector dampens social entrepreneurship needed to ensure social justice in the civil society, while private control could escalate social injustice.

## Nonprofit Sector Institutions

The nonprofit sector comprises of various socio-economic institutions or agents with myriad of market-based activities just like private for-profit business sector. While leadership, human resource capacity, program capacity, accountability, mission efficacy, and adaptability are essential features of a reliable institution, financial sustainability remains the core of every nonprofit institution in market economies. Even purely religious or charitable social gatherings require financial sustainability in a market economy. However, to ensure separation between political-economic activities and purely religious activities as well as other private charitable social activities, there is a tendency to distinguish between public and private nonprofit organizations, particularly in the United States. The distinction tends to compromise the unique intermediary role of the nonprofit sector. The unique nature of the nonprofit sector is compromised because in the bid to rationalize market-based activities, some invaluable social elements of charitable activities such as trust, kindness, fairness, individual liberty, and altruistic voluntary contributions tend to be undermined, even in program activities complementary to public policy (Odetunde 2015). It is therefore self-evident that the nonprofit sector institutions only need empowerment to identify their various unique roles in the social environment for free association based on conscientious charitable trust and goodwill.

Besides, the relationship between the nonprofit sector institutions and public sector institutions could be adversarial or cooperative. Also, private entities could distribute profit or loss among individuals, while nonprofit institutions are either financially sustained, exist only as invaluable social environment, or become extinct. Nonprofit sector does not have to be private or public. When the role of the nonprofit sector institution is compromised with that of the public sector institution, it could result in added costs, unnecessary duplication of efforts, and wastes or economic inefficiency (Gillette 1994). Grassroot efforts to link public sector economic activities with private

economic activities are undermined. On the other hand, charitable social values for improved living conditions among people could be grossly undermined when the role of nonprofit sector institution is compromised with that of private entities or institutions. It is possible to identify economically productive nonprofit sector institutions and prudently sustain them with financial grants. Nonprofit sector institutions can be legitimately funded by both public and private sectors of the economy to ensure social justice.

Nonprofit sector institutions are different from public sector institutions and private sector establishments in market-based allocations of essential goods and services because the goal is to ensure equitability for improved living conditions among people. The goal enhances social value of economic goods and services. This intermediary role is needed as supply and demand for essential goods and services become much more complex. Independent nonprofit institutions are better positioned to channel profits to enhance equitable allocations through market-based social entrepreneurship in some essential economic sectors. The Flint, Michigan, lead-water crisis in the United States illustrates the current lack of clarity about the unique niche of nonprofit as the third sector of the economy. The quasi-public management of water supply based on user fees creates plausible impression of free essential good to which every member of the community is entitled. With the introduction of money into the economic environment, political leaders as well as administrators are therefore caught in the confusing debates and complex processes of determining cost-effective supply of essential safe portable water to people in the community. Similar issues underlie current political debates about affordable health-care costs in the United States because nonprofit institutions are still struggling to identify their unique niches in this major sector of the economy.

## Nonprofit Sector Missions

While profitability may not always distinguish nonprofit institutions from private establishments in market-based activities, their missions do. A substantive nonprofit mission would normally have obvious social value for public goodwill. Although nonprofit institutions, understandably, measure performance in financial metrics, "measuring organizational success must focus primarily on achieving their mission" (Epstein and McFarlan 2011, p. 27). Mission efficacy is the essence of nonprofit institutions not financial profitability as private for-profit entities. The difference between private for-profit institutions and nonprofit or not-for-profit institutions is not profit-making but profit-distribution constraints (Salamon and Sokolowski 2016). Although it is virtually impossible to objectively measure the impacts of social values in monetary terms, those impacts cannot be ignored to ensure social justice in any economy. Some attempts to ensure social justice are usually reflected in the mission of any nonprofit organization.

Overarching the principles governing all operations of any major human institution is social justice. Right to life in a free and just social environment is a universal need. Research has documented the indisputable contributions of nonprofit organizations to economic and political developments together with social capital (Salamon and Sokolowski 2016). Although the concern may be variously stated, the mission goal of every nonprofit organization ultimately aligns with ensuring social justice as public policy to be efficacious. It is plausible to assume that public interactions produce communal efforts for mutual benefits while individuals have the right to internalize the benefits of free productive associations. The operations of public and private institutions in any market economy tend to be based on those implicit assumptions. The missions of nonprofit sector institutions are invariably needed to mediate the impacts of those implicit assumptions on individual well-being to ensure social justice in market-based activities.

If the nonprofit sector did not identify its unique niches, the mission goals of relevant institutions in the sector could be compromised or thriving organizations could become extinct in market-based activities. On the other hand, if the needed roles of nonprofit were ignored, there could be a perpetual problem of stabilizing

market-based activities in those economic sectors of essential needs such as housing, health care, and education as it is being experienced in the United States. For example, despite the perennial problems of home foreclosures and vacant or abandoned residential properties, homelessness and how to make adequate and decent quality housing affordable for low-income American households remain unresolved public policy issue (Odetunde 2015). Thus, in the United States, nonprofit organizations variously continue to grapple with charitable social services for the homeless and assisted housing for low-income households as if those houses could be produced outside the larger context of the housing market (Odetunde 2015). The role of nonprofit sector in the housing market is to complement the mortgage-leveraging feature to mitigate the persistent housing problems of the vulnerable and low-income population. Currently, local housing authorities in the United States commonly mediate market-based activities in terms of supply and demand for housing as shelter. The investment aspect of housing as capital item is ignored. Nonprofit sector institutions have not identified their unique niches or missions in the housing market, particularly in the United States.

Apart from profit-motive differences, the missions of nonprofit institutions usually differ from those of private for-profit establishments. For-profit entities take risks to enter into various markets as suppliers or producers of goods and services. Therefore, private entities normally prepare to internalize some profits or losses. On the other hand, nonprofit institutions, as charitable producers or suppliers of certain essential goods and services, seek to expand the markets hoping to voluntarily recoup losses without internalizing profits. Hence, in the United States, nonprofit institutions are typically tax exempt to encourage those social values interwoven with the goods and services. Whereas competition among for-profit suppliers, using market mechanisms, could result in nebulous improvements in the social value of goods and services, competition among nonprofit institutions should substantively enhance social value of essential goods and services. That is, the social value of output of goods and services could be another way of distinguishing mission goals of nonprofit institutions from the profit motive of private institutions.

Furthermore, the charitable missions of nonprofit institution suppliers or producers are different from those of public institution. While mission goals of nonprofit institutions could be mutually beneficial to the public, invaluable private social benefits to individual members and voluntary donors of those institutions still have to be respected and preserved. This social capital may seem to require differentiating charitable mission goals from promoting particular religious beliefs or political agenda. However, the need for such differentiation may become unnecessary if the nonprofit sector is duly recognized as partners in public policy and administration, as opposed to being involved as public policy implementation contractors (Lane 2013). The mutually beneficial mission goal or social capital remains the focus for encouragement.

Contractual partnerships with nonprofit sector institutions are differentiated from contracting with private sector for-profit entities in order to retain the mission goals or the unique intermediary niches. While public-private partnerships tend to focus on the movement of money in terms of expected outcomes, cost-effectiveness, and accountability (Swanson et al. 2014), nonprofit institutions focus on reaching the intended beneficiaries of outcomes or improving substantive quality of outcomes to ensure social justice. Improving substantive quality of outcomes could be in form of direct charitable social values or direct quality of products. Hence, the missions of nonprofit institutions remain the yardstick for measuring whether they fail or succeed. Nonprofit institutions are consumer-oriented suppliers whose mission goals arise from substantive ecological needs by people or some group of people to ensure social justice, though there could be several derivative mission goals. Since the goal is not profit making for distribution, money serves as true medium of exchange in the nonprofit sector. If profit was made it enhances the mission of the nonprofit institution. The goal is not to supplant profit in competition with private sector institutions. The intermediary role is to give the

appropriate priority to essential goods and services for improved living conditions of the people. Nonprofit institutions cannot make better impacts than private for-profit businesses without taking their mission goals into account in the contractual processes.

While the impacts of various mission goals are being encouraged, they are not to be dictated by the public because social values are subjective. This intermediary role avoids confusing social values with economic impacts. At the same time it encourages social entrepreneurship as nonprofit institutions compete in their mission goals to identify their unique niches to ensure social justice. Society could be self-regulating with social entrepreneurship. Therefore, nonprofit institutions are not just charities mediating between greedy and lazy people or even poor and rich people. Rather, the unique niche of nonprofit institutions in economic rationale is to bridge the gap in the market-based processes of allocating essential goods and services among people for improved living conditions. For this reason, contractual partnership with nonprofit institutions seeks to identify with and encourage positive outcomes relating to essential goods and services, instead of attempting to dictate outcomes or even interfere with the processes.

Although the charitable missions of nonprofit organizations are beneficial to the public, they are not dictated by the public because of the subjective and heterogeneous nature of our social values. Besides, the mission of a nonprofit organization does not have to be public nor private because "they operate free from monitoring that exists either through the electoral checks of politics or the profit-maximizing interests of shareholders" (Gillette 1994, p. 1). The ontological status of the concept of social capital in the private sector remains nebulous, at best, as observed from the experiences of developing economies. Empirical evidence has not shown that social values can be separated from economic values. Therefore, while the social values of mission goals may be largely perceived and not dictated by the public, the positive contributions of those social values to individual well-being cannot be disregarded to ensure social justice. The goodwill of nonprofit organizations or their recognizable social values provide the basis for voluntary and generous support from both public and private sectors of the economy.

## Conclusion

The foregoing conceptual understanding of the economy and nonprofit sector is critical because in public policy and administration, both public and private economic activities have become inextricably interwoven. Nonprofit institutions are needed to ensure equitable allocations of essential goods and services through various markets within every economy to improve living conditions of people. The economic forces of the sector are not to be ignored but channeled for positive social impacts. Since the mission goal is not usually to supplant profit making, nonprofit institution may or may not be making profit. The distinguishing attribute is profit-distribution constraint to enhance the mission goal. This attribute and various missions of nonprofit sector institutions distinguish them from either public or private sector institutions. While the mission goals of nonprofit sector institutions are beneficial to the public, they are not dictated by the public. However, particularly in developed economies, they have to be characteristically voluntary and transparent enough for public goodwill. Then, they are to be encouraged by both public and private sectors of the economy to preserve invaluable social capital and ensure social justice. Nonprofit sector institutions in turn, through social entrepreneurship, identify various intermediary unique roles to ensure equitable distribution of essential goods and services for improved living conditions.

Digital democracy; Electronic democracy

## Definition

The e-democracy concerns the participation of citizens in policy and decision-making processes through the use of information and communication technologies (ICTs).

## Introduction

The participation of citizens in local public life is not a new phenomenon. History is full of examples of people engaged in taking part in collective decisions within a government, a public institution, or a civil society organization. Citizen advisory boards, local citizen committees, parliamentary commissions and mediation, class action, etc., are some examples of organizational forms of public participation in the policy and decision-making processes.

The citizen participation is a process in which people take part in public affairs for exerting influence on policy process and on choices that significantly affect the life of their community (André et al. 2012). Although participation has been in the academy's vocabulary for quite some time, a clarification is needed in this instance. Participation refers to different ways to categorize the various kinds of citizen involvement in public life. In this regard, it is useful to distinguish between political and civic participation (Verba et al. 1995). The political participation (or political engagement) occurs when citizens take part in public affairs in order to exert influence on government action. In contrast to political participation, civic participation (or civic engagement) refers to the organized voluntary activity by working for solving problems and helping other people in a community. (Other scholars view the political participation as that part of the wider civic participation that concerns action taken by a citizen to influence the outcome of a political issue (e.g., Zukin et al. 2006).) Thus, public engagement is more than the forms of participation through which citizens seek to influence a decision – political participation – because it also encompasses a set of voluntary actions aimed at improving the civil society organization, civic participation.

The rapid growth of the ICTs offers citizens many opportunities for participation in government decision-making and in the public sphere. Digital technologies help to improve the relationships between citizens and governments in terms of access to government information, effectiveness, and quality of decision-making. The development of stronger relationships between citizens and governments through digital technologies, such as online public engagement tools and wikis, has also generated new forms of government–citizen communication in which citizens are viewed as partners and comakers of policy. Such new forms, well-known as e-democracy, e-participation, and e-voting, allow to enhance the active involvement of citizens in policy- and decision-making processes. Respect than the traditional forms of democracy, citizens can now actively participate in policy and decision-making processes regarding the public affairs through the use of ICTs (e-democracy).

Governmental, regional, and local public administrations around the world have implemented digital technologies for promoting communication with citizens, for disseminating information, and for enabling stakeholders to engage in governance. In particular, research showed that local administrations are characterized by a rising adoption rate of digital technologies for e-democracy initiatives. In these contexts, people are more involved in government's activities because public information provision and service delivery exert influence more directly in citizens' everyday lives. Thus, local governments more and more tend to enhance participatory democracy, and people have high expectations about the impact of public participation on their lives (Van Veenstra et al. 2011).

## Defining E-Democracy

As noted by Coleman and Norris (2005), there is not a single and a generally agreed definition of e-democracy. Backus (2001) defines e-democracy as a set of processes and structures that encompass all forms of electronic interaction between the government and the citizen. Thus, e-democracy serves to increase the participation of citizens through ICT usage in political debate, enhancing citizens' engagement and the collaboration between actors for policy-making (Hacker and van Dijk 2000). Although different conceptualizations exist, it is commonly accepted that e-democracy concerns the use of ICTs for moving citizens from passive information access to active citizen participation in the governing process.

E-democracy as concept that improves the democracy through use of digital media enables the access to information and knowledge about the political process in order to increase the transparency and to support the online participation in democratic processes. Moreover, e-democracy is generally considered as a subdimension of e-government, in terms of ICT usage to achieve a better government as efficient and effective institution by improving quality of services (e-administration) and citizen participation in the policy-making process (e-democracy).

According to OECD (2001), e-democracy consists of three components: (1) information that indicates a one-way relation in which government provides information for use by citizens, (2) consultation that refers at a two-way relation in which citizens provide feedback to government, and (3) active participation based on partnership between citizens and government. In line, Mergel (2013) distinguishes between three adoption tactics for digital technologies used by government: (1) representation, (2) engagement, and (3) networking. Representation as a push strategy tends to emphasize the ICT use as additional channel of communication for formal government information. Thus, the online presence of governments is necessary for publishing information rather than for citizen engagement. Engagement as a pull strategy permits to collect suggestions and contributions from the public as well as to response to some citizen feedback, without necessarily engaging participants in dialogue. Networking refers to a strategy that focuses on dialogue with citizens, emphasizing interactive and bidirectional communication.

## State of Art

Digital technologies have become an integral part not only of people's lives but also of the

interactions between governments and citizens. The use of these applications reinforces the e-democracy issue, supporting citizens to actively participate in the political process. Web 2.0 (Web 2.0 describes online applications that emphasize user-generated content and are characterized by greater user interactivity and collaboration.) applications, and social media in particular, represent the last step in Internet development, providing new and innovative methods for government to communicate with and engage the public. In particular, social media refer to a collection of Internet-based applications for creating, organizing, combining, sharing, commenting, and rating user-generated content. These tools offer services such as blogs, microblogs, media (audio, photo, video, text) sharing, collaborative projects, and social networking, promoting creation and support of social interaction, collaboration, and exchange of information between users.

A significant and growing body of research investigated the use of ICTs and the Web 2.0, in particular, in the field of e-democracy because of the popularity and diffusion of digital technologies into the government. Some frameworks identify different e-participation's objectives and the appropriate ICT tools to attain them (e.g., Breindl and Francq 2008; Phang and Kankanhalli 2008). For example, digital technologies enable citizens to have easy access to an exponential amount of information with political content. Online forum, online chat, e-mail, or official website support information provision and, consequently, the creation of informed participants that thus can activity contribute in the public sphere. Moreover, other applications, like social networks or microblogs, online consultations, opinion polling, or surveys, allow governments to collect opinions, suggestions, and feedback from the public on policy formulation or implementation. However, governments should gather and use the feedback of citizens to improve the decision-making processes – through, for example, online data analysis tools – in order to fully realize an open information paradigm to support the e-democracy. Only in this way, the citizens' participation in the political process aims not only to discussion but also to having an impact on the final decision. This condition is necessary for driving people to directly contribute to government work by coproducing policies and cocreating public value.

Macintosh (2004) identified two main dimensions of e-democracy: e-participation as the use of ICT tools for enabling opportunities for consultation and dialogue between government and citizens and e-voting as the use of ICT tools for enabling formal voting.

ICTs sustain the democratic development of public institutions encouraging citizens to be involved in public debate and actively participate for improving public life. In particular, Päivärinta and Sæbø (2006) showed that technologies could support different models of democracy: deliberative, liberal, partisan, and direct. Several goals and means tend to mainly characterize and define the models of democracy: the main goal of democracy is to contribute to opinion forming or to decision-making; the primary means of democracy refers to the use of elected representatives or to directing voting by people, thereby, considering both the inclusion in decisions, as related to the ability of adults to participate in debates and decision-making processes, and the control of agenda, in terms of who decides and what should be decided. Inclusion in decisions and the control of agenda help to both classify and compare different models of e-democracy identifying who sets the agenda and which is the role and contribution of citizens in decision-making processes. Citizens set the agenda both in partisan and direct democracy. Only in the direct democracy, citizens having an explicit and defined role in decision-making processes set the agenda both for public discussion and decision-making having an explicit and defined role in decision-making processes. Government as politicians and officers set the agenda in liberal and deliberative democracy. Only in a deliberative democracy, citizens tend to play an explicitly defined role in decision-making processes being expected that their voices are heard with regard to a matter initiated by the government, while in both partisan and liberal democracy citizens are mainly and implicitly included in decision-making processes. Citizens set the agenda only for public discussion in a partisan democracy. Different models of

e-democracy imply that ICTs serve and support the actors in a different way. When citizens set the agenda, ICTs permit to obtain visibility for alternative political expressions (partisan democracy) or emerge as a mechanism of coordination between decision-makers and relevant condition for democracy occurring (direct democracy). ICTs contribute to increase the levels of citizens' participation in a quick or direct democracy. When government sets the agenda, ICTs contribute to improve both the amount and quality of information exchange between government and citizens in a liberal democracy in which the decisions occur and citizens are informed before the elections about the political program of candidates. In a deliberative or strong democracy, the development of ICTs helps to increase citizen participation and sustain the involvement of citizens in decision-making processes because the role of citizens is well and explicitly defined even if the government is responsible of setting the agenda (Päivärinta and Sæbø 2006).

According to Trechsel et al. (2003), the e-democracy refers to electronic means of communication enabling citizens to hold politicians accountable in managing res publica, employing different techniques for increasing transparency (e-access), promoting the direct involvement and participation of citizens (e-consultation, e-petition, e-voting), and making available new spaces of information and deliberation for a better quality of opinion formation (e-forums). The Internet usage permits to employ the e-access to improve the availability of official and political information leading to an increasing involvement of citizens; the e-consultations which permit to disseminate to encourage the public, interest groups, and experts to participate in the decision-making process; and the e-petition to enable citizens to invite others to signal support on a public issue. There are two main models of e-voting. E-voting simply replaces traditional ballot by machine or enabling voters from computer Internet connected. It is further possible to distinguish between e-referendum by voting online on a specific public issue and e-election to bridge voters' participation and convenience through the use of the Internet for online registration of voters and ballot transmission (Trechsel et al. 2003).

According to Pratchett (2007), ICTs offer local government new means for reinforcing the relationship between local authorities and citizens. E-democracy devices can be grouped along two dimensions: sustaining the institution of representation or participatory forms citizenship and sustaining the effective communication between citizens and public institutions or enhancing the interaction in terms of facilitating more actors to engage in a dialogue. Online information and e-voting contribute to provide communication and support to representation. E-consultations contribute to support representation by enhancing the interaction. E-petitions and online forums contribute to support the citizenship by strengthening the interaction between citizens and public institutions.

## Future Perspectives

Overall, some main conclusions come out from research on e-democracy. Firstly, the choice of appropriate digital technologies is contingent upon the objectives sought for the e-democracy initiatives. ICTs help to redefine the relationship between citizens and government. Thus, policymakers need to delineate objectives pursuing with an appropriate and formalized digital technology strategies and policies. Secondly, ICTs alone are not a solution to ensure a higher citizen participation in the democratic process because the use of these tools by governments does not automatically guarantee public engagement. Technology is merely a facilitator. Developing a more sophisticated concept of technology in which knowledge, practices, roles, and cultural as well as local contextual factors tends to emerge as a help to deeply understand the e-democracy initiatives. Finally, a key question concerning the evaluation of the effectiveness or success of e-democracy initiatives is whether these tools are really increasing the active participation in policy- and decision-making processes regarding the public affairs. Nowadays, digital technologies tend to be mostly considered as a one-way

communication tool for local governments rather than a way to establish a symmetrical dialogue with citizens.

## Synonyms

Educational effectiveness; Education quality; Public affairs education; Public service education; Training and education

## Introduction: A Changing Notion of Governance

Historically, governance was synonymous with government, and effective governance required that public sector officials and organizations accomplish their stated objectives in a means that efficiently utilized public resources and which upheld core social values. In that context, education for effective governance involved preparing individuals to obtain jobs, advance their careers, and effectively execute their responsibilities within government agencies by instilling ethical values and providing specialized knowledge and skills. This remains an important aspect of effective governance, but by no means does it embody the full breadth of the modern definition.

With increasing globalization and the recognized complexity and interdependence of social and economic problems, scholars and public affairs professionals have recognized that governance involves much more than government or public sector actors (Kahler and Lake 2003; Kettl 2000). In the twenty-first century, effective governance requires collaboration across the public, private, and nonprofit or civil society sectors (Keohane and Nye 2000). The government is an important actor, but it is by no means the sole actor in promoting effective governance. As the definition of governance has evolved and

expanded, educational programs have had to adjust to meet the new challenges and demands (Farazmond 2009; Feldman et al. 2006). For the multitude of governance institutions to be collectively effective, each needs to be led and staffed by skilled individuals who are able to navigate the complex network of stakeholder groups to address both entrenched and new wicked problems that defy simple solutions (Cain and Stier 2010; Crosby and Bryson 2005; Kettl 2000).

Effective governance has some elements which are common across all countries, some which are limited to certain types of political systems or geographic regions, and others still which are particular to the unique characteristics of any country. Given that the definition and scope of governance, and societal and global expectations regarding effectiveness have evolved over time, it is not surprising that the processes for educating individuals to engage in effective governance have also changed. The educational system – in terms of institutions, programs, and quality assurance mechanisms – which is designed to prepare individuals to engage in effective governance demonstrates similar levels of congruence and diversity and temporal development as the concept of governance itself.

Among the universal attributes of effective governance are those affiliated with the fundamental values associated with public service and public affairs. Core public service values – including the pillars of effectiveness, efficiency, and equity, along with more recent emphasis placed on accountability, transparency, and sustainability – guide definitions of effective governance in all contexts and throughout time. This is not to suggest that these values are equal or unchanging, but rather that they play a role in defining effective governance albeit with tradeoffs in priority and emphasis relative to one another depending on circumstances of place and time. Although some values are ubiquitous, others apply only in certain political or economic contexts. For example, in democratic political systems, effective governance will include measures of participation by and responsiveness to the electorate. In contrast, more authoritarian systems may place minimal emphasis on procedural rights. Similarly, centralized versus decentralized systems operationalize governance differently. Greater internal diversity – on the basis of race, ethnicity, language, religion, etc. – can complicate the task of governing effectively and demand different skills.

The definitions of effective governance, or at least the expectations for the ability to achieve effective governance, may also vary based on the level of economic development and extent of institutionalization and rule of law within a country. For example, countries with advanced technological infrastructures will likely have different expectations for transparency than those in which large segments of the population lack access to the most basic public services. As a region, Latin America is recognized for its high and persistent levels of poverty, income inequality, and social exclusion (Altimar 1996; Hoffman and Centeno 2003; Lopez-Calva and Lustig 2010). Within Latin America, many countries have a history of corruption and a culture in which public and private sector actors place individual interests above the collective; they face particular obstacles to effectiveness in governance that require attention within the educational programs dedicated to preparing individuals to address such problems.

Within a general framework of effective governance, individual countries must contend with their unique combination of historical, geographic, demographic, economic, social, and political circumstances. Countries confronting economic recession, political instability, civil or guerilla warfare, attacks by terrorists, or other extreme circumstances, for example, clearly have different priorities in defining effectiveness in governance than those in which such challenges are absent. A snapshot at any point in time, for example, in early 2016, provides numerous illustrations of how these forces change expectations about effective governance. As the government of Colombia negotiates with guerrilla groups an end to the armed conflict which has persisted for more than 50 years and prepares for a transition to peace, there is a demand for public, civil society, and private sector actors with a different array of skills than that were required

during the conflict. These forces are important both in absolute and relative terms. The governance challenges faced by any jurisdiction are not only a function of its internal characteristics but also how those characteristics compare to its neighbors and partners, broadly defined. The economic collapse and political turmoil in Venezuela spill over to its neighbors, as do political scandals in Brazil and the devastating effects of earthquakes in Ecuador.

Similarly, the system of public affairs education in a country is influence by internal and external forces. Among the important factors to consider when examining how education is provided to promote effective governance are who provides the education, what is taught, and on the basis of what criteria is quality assessed and assured?

## Two Models of Educational Providers: National Institutes and University Degrees

In discussing education for effective governance, it is important to distinguish between elective or political positions and those that are appointed or administrative in nature, with the emphasis being placed on the latter. Educating for effective governance is not about campaigns, elections, party politics, or legislative deal-making, but rather about the preparing individuals who serve as the advisors, analysts, administrators, street-level bureaucrats, managers, evaluators, and implementers of the policies developed through political processes. People assume positions of authority in governance through a variety of paths and with diverse educational preparation. Even prior to the expanded notion of governance, the path to government careers and civil service positions varied considerably. With the expanded definition, we find even greater diversity in educational paths.

The broader definition of governance corresponds to a broad spectrum of educational programs which can be labeled as public affairs. While one may speak of public affairs as a profession, not unlike medicine, law, or engineering, it differs from its professional counterparts in these fields in that public affairs generally does not require a specific degree or licensure as a precondition for securing employment. This is not to say that public affairs lacks specialized education. There are, in fact, two specialized forms of education for public affairs which have evolved in response to the demand for more competent leaders and managers in public service organizations: national schools or institutes of public administration and university-based public administration and public policy degrees. The locus of education has implications for the form of education provided and for how quality is assured.

Education for effective governance is generally structured in one of two basic forms, or a combination of the two, depending on the country context. It may be based largely in a single national school or institute of public administration, or it may be spread throughout the university system. National schools or institutes of public administration place greater emphasis on training programs, certificates, and professional development workshops, although increasingly they also offer degrees. Universities are more likely to emphasize formal undergraduate and graduate degree programs, although they too cross over to provide certificates or training. Regardless of the setting and format, these programs focus on entry into and/or advancement within careers in professional, administrative, appointive, and civil service positions, rather than elective political office. Another common element is their emphasis on promoting merit and competence as the basis for selection and promotion in lieu of favoritism, nepotism, or spoils.

Many of the national schools or institutes of administration or public administration are modeled after the earliest examples from Europe, including the National School of Administration (*École nationale d'administration* or ENA) in France and the National Institute of Public Administration (*Instituto Nacional de Administración Pública* or INAP) in Spain. ENA was created in 1945 as a graduate school intended to help democratize access to the senior civil service in France. The school is intended to bring rationality and meritocracy to the selection

process for high-level civil service positions. The school uses a competitive examination system both for entry into ENA and for placement upon graduation (http://www.ena.fr/). INAP was established in 1958 as an autonomous arm of the Spanish national government as the leading civil service training school and was later merged with its local government counterpart which had been created even earlier in 1940 (http://www.inap.es/).

Many national schools maintain their distinctive character as training institutes and arms of the national government, while others have transitioned to operate somewhat like universities. Colombia's Higher School of Public Administration (*Escuela Superior de Administración Publica* or ESAP) began in 1958 in the traditional model of a training and professional development institute, but now offers undergraduate and graduate degrees (http://www.esap.edu.co/portal/).

One can find examples of national schools and institutes in all regions of the world, and many come together under the umbrella of the International Institute of Administrative Sciences (IIAS, see http://www.iias-iisa.org/). National schools and institutes may also affiliate with one of IIAS's member sections on an international or regional scale in the form of the International Association of Schools and Institutes of Administration (IASIA, see http://www.iias-iisa.org/iasia/) or, in the case of Latin America, the Latin American Group for Public Administration (LAGPA, see http://iias-iisa.org/lagpa/). These associations bring together government and academic individuals and organizations to address common goals of advancing public administration and thus, by extension, promoting effective governance or at least one component of effective governance.

Throughout the world, with the notable exception of the United States, national schools or institutes of public administration have historically serves as the primary mechanism for training and education of a large-scale civil service. This practice is widespread in Latin America as well. Some national schools stay true to the French model of emphasis on senior civil service, while others provide more general education and training for civil servants at all levels. In some countries, these schools have the authority to award undergraduate or graduate degrees, whereas in others students acquire training and education without formal degrees. These schools vary considerably in their prestige and reputation in their respective countries. These schools remain important, but they are notably limited in that they are premised on the older, no longer fully accurate, model of governance as government.

The other major means by which public affairs education is delivered is through university-based degree programs. As noted above, while there are no specific degrees required for entry into most public service careers, and many civil servants are educated as lawyers, economists, engineers, and any number of other fields, two degrees have been developed explicitly for the purpose of promoting improved governance. The Master of Public Administration (MPA) and the Master of Public Policy (MPP) degrees have grown in number, quality, and geographic dispersion, and they have come to represent the degrees with the most explicit emphasis on effective governance, both traditionally and broadly defined.

To understand the evolution of MPA and MPP degrees in Latin America, one must understand their history in the United States context and then how they have developed in Latin America. As described by Donald Stokes (1996), public service education in the United States has its roots and first wave in the Progressive Era's desire to protect administration from the corrupt influences of politics through a separation or dichotomy of politics and administration as articulated by Woodrow Wilson in his classic 1887 paper. The precursor to the first MPA degree began as a training program in the City of New York's Bureau of Municipal Research; this served as the impetus for the creation of the MPA at the Maxwell School at Syracuse University (Stokes 1996). From this early start and continuing through the 1930s and 1940s, education for effective governance emphasized teaching the skills of planning, organizing, staffing, directing, coordinating, reporting, and budgeting which formed that basis of PODSCORB (Gulick 1936). Public affairs education has since evolved through to acknowledge the need to have trained professionals willing and

able to get involved in the policy process influencing content, implementation, and analysis by "speaking truth to power" (Wildavsky 1987). The more recent curriculum changes have focused on the need for MPA and MPP programs to prepare students for an environment of increasing global interdependencies (Cain and Stier 2010), less hierarchical directives within organizations and more collaborative leadership across networks (Crosby and Bryson 2005; Feldman et al. 2006), and corresponding importance of emotional intelligence (Mastracci et al. 2010).

Public affairs programs in the United States, whether in the form of MPA, MPP, or related degrees, have a variety of institutional homes. They may be housed in stand-alone schools or colleges of public affairs, within departments of political science, within departments of public administration, in schools of management or business, or in a research centers or institutes. While many of these programs began with an emphasis on governance in its traditional sense of government, they have evolved and expanded to prepare students for a wider range of public service careers that can contribute to more effective governance. For example, many MPP programs prepare analysts to work in think tanks informing government policy although not explicitly working in government. Similarly, the most frequently offered and fastest growing specialization within MPA programs in the United States is in nonprofit administration. While MPA and MPP programs in the United States began with an emphasis on preparing graduates for employment in the national government, the 1970s through 1990s saw an increased emphasis on employment in state and local government, and surveys from 2014 illustrate that the employment of MPA and MPP graduates in the nonprofit and private sectors surpasses rates of employment in national, state, or local levels of government (http://www.naspaa.org/DataCenter/index.asp).

Just as the early models of national institutes and schools of public administration have spread from Europe throughout the world, so too has the US model of professional master's degrees in public affairs (Geva-May et al. 2008). MPA and MPP programs are offered at universities throughout the Latin American region in countries as diverse as Argentina, Brazil, Chile, Colombia, Costa Rica, Mexico, and Venezuela, among others. Notably, not all programs in Latin America reflect the same expansive definition of governance in their educational programs nor do they have the same emphasis on educating students for the nonprofit sector or work within civil society organizations. Movement in that direction is likely to occur more gradually over time if the practice of following the United States lead persists.

## Content, Curriculum, and Competencies in Educating for Effective Governance

There are notable differences in the curriculum content of public affairs programs between the national institutes and the university-based programs, as well as across countries, and over time. As noted earlier, the national schools and institutes remain focused almost exclusively on the narrower notion of governance in the form of government service. Even so, they play a vital role in advancing professionalism and creating esprit de corps within a country's civil service. In what may be simultaneously a strength and a weakness, the directors of many of these schools are presidential appointees, and their educational and training programs may be heavily influenced by ideological and policy priorities of a particular administration. This close connection to the political world can keep the work of the institute relevant to pressing policy needs, but may also politicize their activities.

University-based programs generally maintain a degree of independence from political pressures of national governments, although the extent of autonomy understandably varies between public and private universities and among countries. Here the development of curriculum has been less driven by politics and more by changes in scholarly thought about the role of public affairs education in promoting effective governance.

Within university-based public affairs programs in the United States, the curriculum has developed from an emphasis on generalist

PODSCORB administrative skills to more specialized knowledge and skills depending on the focus of the program. MPP programs have emphasized advanced quantitative analytical techniques to address policy issues in the areas of health, the environment, education, national security, etc. In response to changing definitions and demands of governance, MPA programs have established specializations in nonprofit management, local government administration, healthcare administration, emergency management, and other areas. The shift has been accompanied by a greater emphasis on demonstrable skills or competencies of graduates rather than simply a list of courses which comprise a program curriculum. The transition from input (curriculum) to outcome (competency) measures, and from generalist to specialist focus, has been reflected in, and in some cases led by, the standards of accreditation which serve as the basis for assuring that public affairs education is of sufficient quality to advance effective governance.

## Quality Assurance in Educating for Effective Governance

The systems and standards for quality assurance provide another window into how effective governance is operationalized and promoted through education. The 1990s mark the beginning of an emphasis on higher education quality assurance and accreditation in Latin America, largely in response to increased demands for higher education, a proliferation of suppliers, and a corresponding heightened concern about disparities in quality (de la Garza Aguilar 2008; Inga and Velasquez Silva 2005; Lopez Segrera 2010; Martin and Stella 2007). Throughout the region, countries have adopted laws and established agencies to assess quality in higher education; however, they differ on a variety of factors. They may focus on institutions and/or programs, apply to public and/or private universities, be mandatory or voluntary, ensure threshold levels of quality or promote excellence, and measure inputs, processes, and/or results, among other factors. While almost all countries in the region have national systems of quality assurance and accreditation, few have established criteria and processes specific to public affairs programs. Instead, the quality of public affairs programs is as part of a broader evaluation of the quality of an institution overall or at the program level but using generic criteria that apply to the full range of disciplines. While this might suggest that there is little within the national accreditation standards which can provide insight into definitions of effective governance, the evidence suggest otherwise. For example, Colombia's National Accreditation Counsel (*Consejo Nacional de Acreditactión* or CNA) updated its accreditation guidelines in 2014 to explicitly state that high-quality institutions will promote social inclusion and peace in the country. Similarly, Ecuador's accreditation guidelines emphasize the values associated with the National Plan of Good Living (*Plan Nacional de Buen Vivir*). While not specific to public affairs programs, these guidelines do influence public affairs education.

In addition to these quality assurance agencies within the national government apparatuses, international nongovernmental accreditors are beginning to influence Latin American notions of how to educate for effective governance. Specialized accreditation of programs with a focus on educating for effective governance is largely in the hands of nongovernmental entities and is voluntary rather than obligatory in nature. Quality assurance in the form of accreditation of public affairs programs is a means by which programs are held accountable to a set of standards intended to reflect the needs of the profession.

Accreditation of public affairs programs began in the United States in 1986 under the auspices of what was then the National Association of Schools of Public Affairs and Administration (NASPAA). NASPAA is the most well-established accreditor of public affairs programs. While it remains based in the United States and continues to use the same acronym, in 2012 NASPAA members voted to change the name to the Network of Schools of Public Policy, Affairs, and Administration reflecting both the explicit inclusion of public policy and NASPAA's status as an international membership association and

global accreditor. With its expanded scope, NASPAA has grown to more than 300 institutional members from 23 countries as of April 2016; among the members are six programs from universities in the Latin America and Caribbean region, including two in Colombia, two in Mexico, and one each in Venezuela and Puerto Rico (http://www.naspaa.org/about_naspaa/members/member_roster.asp).

Through its Commission on Peer Review and Accreditation (COPRA), NASPAA accredits professional master's level degree program in public administration, public policy, and public affairs. NASPAA's accreditation standards reflect an evolution through three distinct phases or generations (Rubaii and Calarusse 2012). In the initial period, from 1986 to 1992, the emphasis was on resources or inputs in the form of sufficient numbers of faculty, infrastructure, library holdings, and demonstrated curriculum content in specified areas. The standards articulated common curriculum requirements in three broad areas: (1) management of public service organizations, (2) application of quantitative and qualitative techniques of analysis, and (3) understanding of the public policy and organizational environment. Across these three areas, more specific components were identified consisting of human resources; budgeting and financial processes; policy and program formulation, implementation, and evaluation; decision-making and problem-solving; political and legal institutions and processes; economic and social institutions and processes; and organization and management concepts and behavior (NASPAA 2008). The second generation of standards, spanning the period of 1992 through 2009, allowed for greater flexibility in accordance with a program's stated mission and began the process of requiring rudimentary program evaluation. Added to the common curriculum requirements in this stage was information management, technology applications, and policy and a requirement that programs demonstrate diversity across the entire curriculum (Rubaii and Calarusse 2012; NASPAA 2008).

The third generation which began in 2009 has maintained the mission-based philosophy and brought in an emphasis on demonstrated evidence of student learning across five universal competency domains: (1) to lead and manage in public governance; (2) to participate in and contribute to the policy process; (3) to analyze, synthesize, think critically, solve problems, and make decisions; (4) to articulate and apply a public service perspective; and (5) to communicate and interact productively with a diverse and changing workforce and citizenry (NASPAA 2014). Because these universal competencies apply to all programs seeking accreditation, the NASPAA standards provide one definition for what education is required to promote effective governance. Programs are required, however, to define each of these universal competency areas within the context of their unique program missions, suggesting considerable flexibility in the definition of effective governance. As of May 2016, 192 programs based in 179 universities located in 40 of the United States, the District of Colombia, Puerto Rico, China, Egypt, and the Republic of Korea have been recognized with NASPAA accreditation (https://naspaaaccreditation.files.wordpress.com/2015/07/annual-roster-of-accredited-programs-updated-09-01-15.pdf). As of 2016, universities in Venezuela, Colombia, and Mexico have indicated interest and plans in securing NASPAA accreditation for their master's programs.

While NASPAA is undoubtedly the most established and experienced accreditor of public affairs programs, it is not the only international body offering such services to programs in Latin America. The newest player on the scene of international public affairs accreditation is IASIA's International Commission on Accreditation of Public Administration Education and Training Programs (ICAPA). ICAPA was established in 2012, and it made its first mark in Latin America shortly thereafter. The first of the two accreditations awarded by ICAPA as of May 2016 was to the public affairs schools of Getulio Vargas Foundation (FGV) located in Sao Paulo and Rio de Janeiro, Brazil (http://www.iias-iisa.org/iasia/first-ciapa-accreditation/).

While NASPAA accreditation is limited to professional master's degrees based on an underlying assuming that this is the level and type of

education tailored to preparing individuals to engage in effective governance, IASIA accreditation is open to a wider range of applicants. IASIA makes accreditation available to degree programs at all levels (undergraduate, masters, and doctorate), entire schools within universities, individual courses or training programs, and national institutes. The criteria used by ICAPA are based upon a set of standards developed by a joint United Nations Department of Economic and Social Affairs (UNDESA)/IASIA Task Force which was initiated by the United Nations in 2005. In contrast to NASPAA's competency-based standards which required demonstrated and measurable achievements, IASIA places greater emphasis on evidence of commitment to continuous improvement. The Standards of Excellence for Public Administration Education and Training address eight core topics: public service commitment; advocacy of public interest values; the combination of scholarship, practice, and community service; the centrality of faculty; prioritizing inclusiveness; having a curriculum that is purposeful and responsive; sufficiency of resources; and balancing collaboration and competition (IASIA/UNDESA 2008). These eight standards are framed more in terms of guiding principles than measurable requirements. In this context, there is considerably greater flexibility in defining what constitutes effective governance and what education is required to promote that goal.

## Conclusion

Scholars and practitioners throughout the world recognize the need to have within government agencies at all levels, and within nonprofit and private sector organizations, individuals who embody high ethical standards, demonstrate a commitment to advancing the public interest, and have the knowledge, skills, and abilities to effectively execute policies. The challenges of effective governance and the need for educational programs dedicated to preparing individuals to contribute to more effective governance are supremely evident throughout Latin America.

A range of educational programs – most notably national schools and institutes of public administration and Master of Public Administration and Master of Public Policy programs – have been developed to prepare individuals to meet these needs. Collectively, they comprise the system which is best able to provide the education needed to improve the effectiveness of governance within and across countries. Educating for effective governance continues to be challenged by the changing nature of governance and the complexity of issues with which governments at all levels, along with their nonprofit and private sector counterparts, must confront.

# Education and Training in Crisis Management

John J. Walsh
Vanderbilt University Medical Center, Nashville, TN, USA

## Synonyms

Continuity of operations; Disaster education; Disaster management; Disaster risk reduction; Emergency management; Risk management

## Introduction

The preparation and response to events which cause disruptions to individuals, institutions, organizations, and systems include a broad framework of complex concepts, theories, strategies, and integrated coordination of operational activities. The usage and meaning of terms related to these elements is determined within a set of perspectives dependent on any number of varied factors relative to professional focus, organizational and governance structure, training and education, and geographical reference. Whether the term crisis, disaster, emergency, or other interconnected terms are used, they all revolve around the management of threatening events that require a systemic organizational approach for preparing, responding, and recovering from disruptive situations. Understanding the contextual environments in which the different terminologies are used gives an indication of the

perspective of focus. The interdisciplinary approach for dealing with these types of disruptions further adds to the complexity of clarity. Many of the terms are used somewhat interchangeably in both practice and concept. Whereas the term crisis management reflects a more business organization framework, it is readily used in describing a process for dealing with all types of threats in both public and private environments. Emergency or disaster management consists of many overlapping concepts, theories, and protocols used in crisis management. The terminology is further convoluted as conceptual and theoretical components associated with business continuity, risk management, disaster risk reduction, incident management, and other terms begin to distinguish themselves as separate but compatible elements. The perspective and usage is key to contextual appropriateness. For purposes of this entry, "crisis management" will be used as the generic term used to describe the preparedness, response, and recovery processes used to deal with all types of hazards and threats whether they be natural, man-made, or technological. This generalization of terminology is with full acknowledgement and understanding that within disciplines of professional and academic focus, specificity of definitions, concepts, theories, and practices all have inherent relativity and purpose.

## Education Versus Training: There is a Distinct Difference

As with crisis management terminology, often the distinctions between education and training are lost in their interchanging usage. This confusion is the result of the crossover of educational institutions and organizations focus into other lanes of specialty. It is the evolution of academics and training entities as they adjust to the growing need for expanded knowledge and skill development. Definitions vary; however, the main distinction revolves around a central concept. Education's primary focus is on instilling behavioral change through the imparting of knowledge of concepts, facts, and principles. It is the foundation for learning skills for problem solving. Training, on the other hand, is the acquisition of skills needed to master a particular skill or set of skills. Moore (1998) describes the difference in this manner, "...education enables students to see the forest *and* the trees. It encourages general approaches to problem solving and inculcates ways of thinking that are productive, effective, and rewarding. An education prepares a student to deal with and solve a broad range of problems, and to choose which problems are important and which are not." Moore views training as "...a narrowly focused program that leads to high proficiency in a specific skill. It prepares a student for one particular job or activity but provides neither broad perspective nor flexibility of approach."

The distinction then becomes one of purpose and focus which addresses the specific needs of either the potential recipient or the organization structure it is intended to impact. Individuals who are professionals or aspire to become career professionals within a specific discipline will most likely seek the benefits derived from attending an academic institution which offers a degree program. Conversely, individuals who seek to increase their skill in a particular function or aspect related to crisis management may find that an available training course may adequately provide the necessary skill set to become proficient in the task. Organizations may encourage their employees to attend these courses as part of their job requirements or as part of an employment track associated with professional development. The chosen path for acquiring the knowledge or skill is determined on a set of factors specific to the goals and objectives of the individual or organization. The key is understanding the different elements derived from an education approach versus a training approach and how those fulfil the desired outcome objectives. Both have succinct advantages and benefits for those who undertake and complete either.

## Certificate or Degree

It is not uncommon to find academic institutions offering both education and training within their crisis management portfolios. The establishment

of certificate programs increasingly allows them to enter into the training realm providing them with added exposure to the professional learner as well as to the traditional student. From the training perspective, federal agencies, professional associations, academic institutions, and independent private sector entities are all partnering to deliver crisis education and training in a number of venues and under a variety of working agreements and arrangements. The Occupational Safety and Health Administration (OSHA) is one department that maintains numerous certification and degree program arrangements with affiliated universities, community colleges, education centers, and training institutes.

The Federal Emergency Management Agency (FEMA) offers a complete training course portfolio within its Emergency Management Institute (EMI) for emergency management professionals which covers an expansive list of topic areas specifically tailored to skill proficiency and professional development. From the US perspective, EMI is nationally and internationally recognized as a leading training component in crisis and emergency management. Within FEMA's National Training and Education Division which includes EMI and the Center for Domestic Preparedness (CDP), it offers over 700 courses encompassing ten different disciplines, in ten core capabilities, covering six mission areas (Table 1). The mechanism for delivering these courses, both as independent study and instructor led, involves online/distance learning and resident, mobile/non-direct, and direct modes incorporating a partnership of 12 independent universities, community colleges, consortium, and organizations. All of FEMA's courses follow principles of both adult learning theory and instructional system design (ISD) and conform to nationally recognized standards. Its training undergoes a rigorous validation process and assessment on a continuous basis.

The number of universities, colleges, and community colleges offering degrees in crisis management-related disciplines has grown considerably over the past 35 years. The establishment of FEMA in 1979 and the events of 9/11 and other events helped spur growth and interest in the USA in crisis conceptualization, theoretical understanding, research, and response operations to disruptive situations and occurrences. This same academic focus within crisis and disaster study has occurred worldwide with academic institutions on every continent engaged in some type of academically focused coursework and research in the field. This universal emphasis has allowed both professionals and traditional students the choice of attaining academic degrees offered under a broadening of pedagogical modes both domestically and internationally. Degrees in the crisis management discipline are readily available at the associate, bachelors, masters, and PhD levels. Increasingly today, major mainstream academic institutions are offering online, distance learning and unique instructional

designed formats to accommodate the modern-day adult learner in their need for flexible learning environments.

The establishment and utilization of certificate programs in crisis management is a growing venture in both academic institutions and professional organizations. Career professionals in the field now have opportunities to attain professional certification in a number of associated fields. Certifications can be designated through completion of courses authorized and sanctioned by professional associations and societies, academic institutions, or, in some cases, a private certifier. The key to the veracity of the certification lies in the reputation, authority, and adherence to a set of professional standards. One such accrediting body is the American National Standards Institute (ANSI) which requires the certifying organization to undergo a rigorous assessment of their program and processes. Not all certifying entities go through a certification assessment but still issue a certificate for completion of their program.

## Characteristics of Education and Training Programs in Crisis Management

Program emphasis consists of a broad spectrum of topics depending on the primary focus of the particular school or organization. The use of a program's name may also be indicative of its intended direction; however, the best indicator of the content and objective of any program can be found in its program of instruction (POI) or individual course syllabi.

Many programs in the crisis management field will have similar theme and cover similar topic areas although programs focused in specific disciplines may be more orientated toward a particular practice or professional emphasis. Business-focused programs may emphasize business continuity, protection of business financial operations, or information technology topics, whereas homeland security programs may offer more courses related to terrorism, infrastructure protection, intelligence processes, or criminal financial operations. In general, the overarching theme of crisis management programs maintains basic core courses designed to provide added knowledge and skills for managing a complex array of potential disastrous events occurring over a wide spectrum of disciplines, capabilities, and mission areas. This is further illustrated in Table 2, which breaks down the curriculum offerings of two sample programs.

Major categories within crisis management for both degree and certificate programs cover a wide spectrum of focus. Most incorporate at least one or more areas of interest in their curricula to include, at a minimum, areas related to public policy, communication, schools, crisis prevention, professional development, exercise/training, hazard assessment, and/or risk. The list is comprehensive and includes considerable overlapping of topics and concentrations. From a worldwide perspective, most education and training in crisis management follows along common themes, although the differences can be quite pronounced when comparing US focus with that of the European Union (EU) emphasis and other parts of the world. When crisis management concentrates on hazard-specific preparedness and response, the emphasis for most countries remains very common. The differences come to light when factors such as economics, capabilities and capacities, infrastructure, and governance structures begin to impact operations and operational strategies. Many of the EU education and training programs in crisis management give considerable focus on disaster and sustainable development issues within the framework of developing countries. By contrast, most US programs tend to focus more on processes dealing with US-specific hazards.

Ingrassia et al. (2014) provide a comprehensive analytical study of education and training initiatives for crisis management in the European Union. Many of the EU programs emphasize core topics in management, protection and safety, law and ethics, healthcare, mental health, hazard and vulnerability analysis, logistics and transportation, urban search and rescue, and public health. Similarities and differences in both scope and focus exist when comparing the US education and training approach to crisis management programs.

**Education and Training in Crisis Management, Table 2** Two sample program courses in crisis management

| Institution | Course title | Topic areas |
|---|---|---|
| University A | Crisis management and business continuity | Industry laws, standards, and metrics<br>Supply chain management<br>Cybersecurity and data breaches<br>IT/DR trends – current and future<br>Federal, state, and local response<br>Terrorism threats/response<br>Large and small organization BCP practices<br>Pandemic issues<br>What the news media will do to you<br>Social media strategies<br>Response leadership<br>BC program leadership<br>Crisis event simulation |
| University B | Crisis management | Proactive crisis management<br>Challenge your basic beliefs about the nature of crises<br>Learn to scan your business practices for reputational, political, and regulatory risks<br>Anticipate and prepare for potential crises<br>Developing a crisis management plan<br>Integrate your crisis management approach into your overall business strategy<br>Design reputation management strategies and processes<br>Define roles and responsibilities<br>Managing a crisis<br>Explore techniques for successfully solving crisis situations characterized by complex decision environments, time pressures, high stakes, unanticipated events, and information overload<br>Develop strategies for managing stakeholders, public opinion, media relations, and public officials<br>Approach crisis situations as an opportunity to strengthen the organization's reputation and brand<br>Incorporate reputation-restoring strategies to minimize fallout and spark a successful recovery |

## Crisis Management Enhanced Through Disaster Education as a Policy Function

Common terminology usage related to disaster education is another example of mixed meaning for multiple terms. It is often described as a learning and training element addressed in crisis management, emergency management, risk management and risk reduction, continuity of operations, and resiliency programs. Although terminology focus may vary depending on the discipline or context it is used in, it is a general-usage term used to identify strategies and programs designed to create behavioral change in response patterns and reduce mortality and morbidity among the population. It is a more general concept that is prevalent in policy and strategy development utilized by world bodies focused on national and international preparedness and response to crisis events (UN Sendai Framework for Disaster Risk Reduction 2015–2030).

Disaster education continues to remain a basic global component for the establishment and enhancement for crisis and resilience strategies. Its inclusion in every major international document representing disaster risk reduction illustrates the importance and weight given to promoting its continued emphasis as a foundational pillar for disaster preparedness, crisis management, sustainable development, and resilience building. Its components are reflective of standard

education and training philosophy designed to input knowledge, guide behavior in an appropriate manner and direction, and instill a sense of preparedness for safely surviving a hazard (Walia 2008).

Disaster education and training are often macro-focused utilizing broad social media and marketing techniques rather than community-based approaches (Glik 2007). This pattern is prevalent in the disaster education and training environment with exception to academic and most certificate programs. Currently in both the USA and EU, the lack of standardization within the crisis and disaster management education and training fields is slowly being addressed. What is required is a more substantive approach encompassing specific quality indicators and measurements directed toward evidence-based outcomes.

As a policy function related to crisis management strategy development impacting broad community preparedness and response efforts, disaster education must be based on learning theory methodology. Eisenman et al. (2009) emphasize the need for using empirically valid methods for improving disaster preparedness, as well as other community-based approaches. Development of education programs that are narrowly focused to include a neighborhood and community perspective with localized input appears to promote hazard adjustments and better preparedness activity (Dufty 2008; Terpstra and Lindell 2009).

As mentioned earlier, schools are another component listed as a crisis management education and training component. Schools can be viewed from a protection aspect related to community infrastructure or as an education tool for imparting knowledge to students within the broader crisis management paradigm. Schools offer a natural environment for establishing and implementing disaster education programs (Finnis et al. 2010). Educating children as part of their school curriculum has a proven track record, and instilling in children the risks involved and the proper protective actions to take during severe weather and tornadic activity is a sound disaster education strategy. Knowledge gained through school education promotion carries over to households and extended family and neighbors.

The actual practice, however, provides a different picture. Disaster-focused curriculum within K–12 education levels is mostly viewed as an extracurricular activity. Minimal time is devoted to disaster preparedness other than cursory attention. Science-based classes may touch on certain aspects of weather-related or hazard threats, but for the most part, they are not included in core curriculum. As the research literature indicates, educating our children about hazard is beneficial, but the follow-through implementation as a course of action and disaster strategy is vastly underutilized, at least from a US perspective.

The impact of disaster education remains mostly an unquantifiable measurement as an effective policy strategy for preparedness and response to crisis events. This lack of substantive information provides a pathway forward for improving and refocusing crisis and disaster education as a major strategy for risk reduction and establishing positive behavioral response to disruptive occurrences. Although the level of scientific knowledge and application of disaster education requires closer scrutiny for establishing it as a fundamental policy strategy within the disaster risk reduction construct, its utilization as an essential element will improve as it undergoes legitimate investigation of its structure, design, benefit, and effective use. The role crisis and disaster education actually attributes to the present preparedness and response system gives insight into its relevancy and challenges for further development and implementation as a key component in crisis management.

## Conclusion

Education and training programs in crisis management are varied, inclusive of private/public involvement, and multidisciplinary in approach and design and cover a broad spectrum of application. Whether from an academic or applied perspective, education and training are core elements of the overall crisis management strategy and play

an important role in the development of safety and security policy. That importance as a policy formulation function is evident in both private sector enterprise and governmental environments. Academic institutions, private and public corporations, and governmental organizations influence the type, quality, and direction in which education and training are presented, developed, and improved relative to crisis management. As formalized standardization is further incorporated into the crisis management regimen, the improvements and benefits will better serve both students and the public at large.

Disaster education is viewed as a principle of crisis management function and disaster reduction strategy. It is a concept broadly defined in traditional terms but is less understood from a learning science perspective. Its usage as a policy strategy must therefore include identified outcomes consisting of quality indicators that are scientifically evidence based. This is not to say that all disaster education programs be rigorously controlled and evaluated, but strategic policy-focused programs should require outcomes based on theoretical framework. Education and training in crisis management must continue to expand as a people-centered focus in both design and development. Community-directed approaches result in better received programs, are more effective, and help to increase community awareness and preparedness levels.

## Synonyms

Breach of trust; Bribery; Crime; Exploitation; Extortion; Fraud; Illegal actions; Nepotism; Public integrity

## Definitions

Corruption is defined by Transparency International (2011) as the "abuse of entrusted power for private gain."

Corruption in education is defined as "the systemic use of public office for private benefit whose impact is significant on access, quality or equity in education" (Hallak and Poisson 2001).

Corruption is a phenomenon that has transcended time and place, as well as political regimes, cultural differences, and societal norms. As such, Robert Klitgaard, a prominent scholar on corruption, argues that corruption is as old as the establishment of government and may even be as old as the establishment of structured social interactions (Klitgaard 1988). He thus associates the emergence of corruption to a degree of sophistication reached by societies. This does not mean that the more developed a society is, the more corrupt it is. Developed societies nowadays are well-established communities that can effectively fight corruption when compared to developing nations.

When looking at corruption, there are certain structural factors that aid its presence and help it to flourish. These can be summarized as weak rule of law (Carothers 1998), lack of transparency (Kolstad and Wiig 2009), official's low income (Van Rijckeghem and Weder 2001), individualism or what can be simply called "greed" (Tanzi 1998), lack of accountability (Bardhan and Mookherjee 2006), size of the informal economy, class inequality and poverty levels (Fayed 2016), and the weakness of the independent anti-corruption agencies. All these factors encourage individuals to be corrupt and thus support the expansion of corruption. Corruption can be committed through a number of forms which are not limited to bribery, embezzlement, theft, fraud, favoritism, and, last, extortion and blackmail (Amundsen 1999). These several types and forms exist worldwide across a multitude of sectors. Regarding corruption in Egypt, it has been cited to be one of the reasons that pushed the masses to rally in January 2011 (Fadel 2011), since then corruption across Egypt has been on the rise (Fayed 2017).

The case at hand, corruption in education in Egypt, is under researched with many of the existing documents tend to be mere opinions that lack scientific analytical foundations (see Badrawy and Yousef 2009). This definitely creates a need to look at this under-researched area and try to fill the existing gap in the literature. Thus, this entry will discuss the plethora of corruption forms that tend to be present within the Egyptian educational sector. These forms that range from nepotism and bribery to fraud and embezzlement negatively affect the educational system through impeding educational reform and decreasing educational equality and quality. However, it is important to highlight that Egyptian educational system encompasses three types of education: state education, religious education, and private education that includes international educational institutions (El Baradei and El Baradei 2004). This system is administered by a number of bureaucratic institutions that are all headed and managed by the Ministry of Education.

The Information and Decision Support Center (IDSC), a government-sponsored thinktank that is part of the Egyptian cabinet, performed a cross-national and cross-sectoral study in 2009 that looked at corruption in Egypt. This study included all the important public sectors across the overstaffed Egyptian bureaucracy; it was conducted through telephone calls on a nationally representative sample. The study revealed that the highest corrupt sectors in Egypt are the sectors of education, health, local councils, and traffic, with the educational sector being the most corrupt (Osman 2013). This raises the simple question of: why is the Egyptian educational sector corrupt?

It can be seen that the long-term presence of several unresolved issues in the Egyptian educational sector has led to its deterioration. To have a better understanding of the most critical ailments of this educational system, it is better to look at it in terms of inputs, process, and outputs. As for the inputs, the schools are overcrowded and poorly funded (Loveluck 2012). Regarding the process, curricula do not stimulate the students which led rote education to be a feature of the process (Sobhy 2012b). Although there is administrative and financial centralization (Loveluck 2012), there is little or even no existence of accountability of the teachers to their seniors,

giving the teacher the discretion to choose what to teach and how to teach it, which leads to inferior and unsatisfactory teaching quality. This helped in the creation and reliance on private tutoring – perceived to be "the way" for students to be able to answer correctly on exams to get good grades. As a result, the outputs are not satisfactory in addition to the fact that the system solidifies educational inequality (Sobhy 2012a). Yet, many state resources are being pumped into this sector with little accountability and transparency efforts. For example, a substantial amount of public funds is being spent on education on yearly basis which makes it the fourth-highest spending avenue among all public services after subsidies, wages, and servicing the debt. Throughout the years of 2005–2008, the average public spending on education was 10.45% of total governmental expenditure (see WB-Data Bank), and in the fiscal year 2012–2013, the spending increased to 13.2% (Loveluck 2012). These issues can explain why the masses in 2011 were calling for increasing the quality of the deteriorating social services, with a focus on education and health.

When the IDSC study looked deeper at the issue of corruption in education, it reached very interesting results. First, corrupt incidents in the educational sector do take place at both the upper and lower echelons of the bureaucracy (Abd El Aleem 2014). Second, respondents identified bribery and favoritism as the two main forms of corruption that are most frequently implemented to commit corrupt actions in the educational sector. Corrupt incidents in the public education sector are many, like parents' forced donations, cheating on exams, selling exams, and physically harassing the students (Sobhy 2012b). Third, respondents identified private tutoring as one of the most vivid and evident forms of corruption in the educational sector, where teachers' intentionally abuse their power over the students and their parents (Osman 2013). Private tutoring in Egypt is a phenomenon that at least 80%, if not much more, of the public general secondary students participate in (Sobhy 2012b). In support of this percentage, in 2009 the aggregate household spending on private tutoring ranged between EGP 12 and 15 billion, while the total budget of the ministry of education in the same year was EGP 10 billion (Sobhy 2012b).

In addition to the IDSC study, my research looked at corruption in education in Egypt (Fayed 2018) and found that just like any other sector in any other country, it has grand and petty corruption cases. These types can be categorized based on their hierarchical level. As we go higher up, there is an increase in the probability of committing grand corruption incidents by governmental officials, and in going down the ladder, the likelihood of committing petty corruption incidents by the governmental officials' increases (Fayed 2018). The following is a generic table that shows corrupt actions associated with each hierarchal level within the educational sector. Unfortunately, the researcher could not find such a table in any of the Egyptian sources, but based on the conducted research and the researcher's knowledge of the Egyptian educational sector, he can support the accuracy and applicability of the contents of this table to the Egyptian case (Table 1).

Based on the table, some corrupt actions can be committed on only one level, while others can be committed in coordination between two or more levels; the latter incidents seem more severe and reveal the systemic problems. Although the above table gives a comprehensive overview of the main types of corrupt actions that can be committed within the educational sector, my research shows that there are some missing types for the table to be truly representative of the Egyptian case. Some examples at the school level could include parents' forced donations (Fayed 2018), the diversion of school meals, and the compensation of teachers and staff with undeserved financial incentives. As for the class level, teachers' selling exams and physically harassing the students are also two corrupt actions commonly witnessed in Egypt but barely included in the literature (Sobhy 2012b).

A very famous example of corruption in education that was well covered by the media and enforces this discussion took place in *Al Sharkeya* governorate where the governor appointed 1387 new teachers in a school that houses a total of 183 students, which resulted in a student to teacher ratio of 1:7, which is unheard of. Most of

**Education Corruption: Egypt, Table 1** Corruption types in the education sector

| Hierarchal level | Corrupt action |
|---|---|
| Ministry (macro level) | Kickback for construction and supply contracts |
| | Favoritism in hiring, appointments, and promotion decisions |
| | Diversion of funds from government accounts |
| | Diversion of funds from international assistance funds |
| | Ghost teachers and employees |
| | Requiring payment for services that should be provided free |
| | Withholding needed approvals and signatures to extort bribes (e.g., gifts, favors, outright payments) |
| | Directing the location of construction and services to locations that offer opportunities for gain by oneself, family, or friends |
| | Requiring the use of materials as a way of creating a market for items on which oneself, family, or friends hold an import or production monopoly |
| Directorate (meso level) | Overlooking school violations on inspector visits in return for bribes or favors |
| | Diversion of school supplies to private market |
| | Favoritism in personnel appointments (e.g., headmasters, teachers) |
| School (microlevel) | Ghost teachers |
| | Diversion of school fees |
| | Inflation of school enrolment data (in countries in which central ministry funds are allocated to school on the basis of enrolment) |
| | Imposition of unauthorized fees |
| | Diversion of central ministry of education funds allocated to schools |
| | Diversion of monies in revolving textbook fund |
| | Diversion of community contributions |
| Class (microlevel) | Siphoning of school supplies and textbooks to local market |
| | Selling test scores and course grades |
| | Selling change of grade |
| | Selling grade-to-grade promotion |
| | Creating the necessity for private tutoring |
| | Teachers' persistent absenteeism to accommodate other income producing work |

Source: (Spector 2005)

these newly appointed teachers were already working abroad. What is even worse is that at no point throughout this process did any of the officials responsible were reported and held accountable. This example shows how the educational bureaucracy as a whole with its divisions participated in committing this clear example of vertical corruption (Hafez 2013).

Another significant example, which was highlighted again by the media, was shown in a report produced by the Central Auditing Authority, which indicated that the Minister of Education's staff spent EGP 222,000 in total for personal meals in a year (Hafez 2014). This case is being investigated by the Administrative Prosecution Authority to produce the relevant punitive measures. However, it is important to note how this case shows how easy it is for high-ranking governmental officials to use state funds at their own discretion. As they knew that no one would dare to report or investigate, they had the free reign to abuse these funds for their personal benefits. A related example is when the Minister of Education gave his advisor unjustified financial bonuses and incentives (Abd El Aleem 2014), never worrying that they would be held accountable for their financial misconduct. When analyzing these incidents, it can be seen the wide extent to which governmental officials have the audacity to do what they please regardless of its legality, as well as the wide scope of the committed corrupt actions.

In conclusion, corruption in education in Egypt takes place, with all its forms, at the higher and lower echelons of the bureaucracy. It is worth mentioning that these corrupt practices are not limited to the educational sector, these practices are present across the Egyptian bureaucracy but with varying levels. To fight corruption in the Egyptian educational sector and beyond, citizens should be active and hold the government accountable through reporting any of the committed corrupt actions. Meanwhile, the genuine political will by the government is required to ensure that the rule of law is enforced on all corrupt individuals.

# Education Infrastructure and Employment: The Moderating Effect of NGOs

Salisu Ahmed Kabiru[1] and Rozita Arshad[2]
[1]Public Administration Department, Umaru Musa Yar'adua University Katsina, Katsina, Nigeria
[2]School of Government, Universiti Utara Malaysia, Changlun, Kedah, Malaysia

## Synonyms

Education infrastructure; Employment; NGOs; Rural development

## Definition

Education infrastructure is defined as all the necessary resources that facilitate educational programs such as school building, teachers, classroom, water point, electricity, furniture, library, laboratory and workshop, and playing ground (Modupe 2012).Within the context of this entry, education infrastructures stand for basic education.

## Introduction

The issue of unemployment is a global problem that is not peculiar to a country or region. For example, unemployment and underemployment combined stand at 30% in most of the less-income countries, while the rate of unemployment in many of the developed countries stands at 7.5% in 2016 and rose to 7.9% in 2017 (Fields 2019). In Nigeria, the issue of unemployment and underemployment has become a pandemic as figure shows that the rate has rose to 30% in 2016 to 40% in 2017 (NBS 2017).

Similarly, recent figures from the office of statistics have indicated that 24 million mostly youth and women out of the 195 million Nigerian were out of job. Fifty percent of youth within the age of 15 and 24 years are residing in the urban areas, while the number of those in rural areas is around 60%. The reason for the high unemployment rate in Nigeria was due to, poor economic performance, fast population growth, disparity in resource distribution between the elite and the masses, and poor infrastructure which makes it difficult for those seeking employment to ply their trade. The proportion of unemployed was largely represented by illiterate people which account for 50%, while primary school leavers and university graduate account for 12.45% put together (Kabiru and Arshad 2016).

Studies on the relationship between education and employment have proven that education has a significant influence on employment opportunity; the higher the level of education, the more the chances of being employed. It is on this background that this study seeks to empirically examine the moderating effect of NGOs on the relationship between education infrastructure (secondary school) and employment in Katsina State, Nigeria. Within the context of this study, secondary school education is referred to as education infrastructure.

## Relevant Literature

Previous studies on the relationship between education and employment have shown that education has a positive and significant influence on employment, for example, Mirica (2014) examines the role of higher education in curbing unemployment rate in Romania. The result from the analysis further shows that the long-term relationship between higher level of education and employment was significant as an increase in the level of education corresponds to a decrease in unemployment rate in Romania. The study further found that with additional increase in the total number of high school graduates, the unemployment rate decreases.

Similarly, Lavrinovicha et al. (2015) examines the role of education in determining the unemployment rate in Latvia. The result from the analyzed data shows that the relationship between higher level of education and employment rate was significant at 0.01. This signifies that the

higher the level of education, the more the chances of being gainfully employed. The study further found a connection between education and income of household, which was also significant at 0.01, with an increase in the level of education leading to an increase in income level by 26% in 2002 and 70% in 2013.

In a similarly study, Riddell and Song (2011) examines the effects of education on unemployment and re-employment in the USA. Findings from the OLS and descriptive statistics show that education has a significant positive impact on re-employment rate. Additionally, the findings reveal that an increase in secondary school attainment does not translate to changes in unemployment rate and that additional secondary schooling does not influence re-employment of the unemployed.

Relatedly, Elima (2015) examines effect of educational attainment on employment in Kenya. The study adopted a time series approach and sourced its data from the Kenyan Integrated Household Survey. A multinomial logit model was used as its tool of analysis and findings reveals that education is an important element in determining youth employment, especially for those with higher education attainment. Whereas, those with low level of education find it difficult in gaining employment. The findings also reveal that individuals with secondary school and tertiary education were more likely to gain wage employment than those with primary or lower level of education. Similarly, individuals with secondary school education and tertiary education are not likely to engage in self-employment in the agricultural sector than those being unemployed. Based on these findings, this study also hypothesized that:

*NGOs moderate the relationship between education infrastructure and employment.*

From the NGOs' perspective, Ahsan and Routray (2007) conducted a study in Bangladesh on the impact of NGOs on employment generation, and the study found that NGOs have significantly contributed to employment generation of the rural dwellers in the area by 7.3% in jobs that last for 3 months, 47% for jobs that last between 3 and 6 months, 38% for jobs that last between 6 and 9 months, and 98% for jobs that last for less than 3 months. However, the overall contribution of NGOs in job creation was found to be significantly high ($p > 0.000$). Based on these findings, this study also hypothesized that:

*There is significant relationship between education infrastructure and employment.*

E

## Methodology

This study adopted survey approach, and the data for the study was obtained through a questionnaire which was distributed to 434 local government staff respondents selected from 9 local government areas of Katsina State drawn from the senatorial district using multistage sampling techniques. A total of 410 questionnaires were returned accounting for 95% rate of returned, and after data cleaning, 10 questionnaires were deleted due to the issue of missing data and outlier; thus a total of 400 usable questionnaires was used for regression analysis. VanVoorhis (2007) classified sampling size as, thus, 50 as very poor, 100 as poor, and 200 as fair, while 300 are satisfactory. Hence, this study has fulfilled the requirement having 400 as the sample size.

## Data Analysis

The statistical tool adopted for this study is PLS-SEM as it's the most widely used tool of analysis in social and behavioral science disciplines in analyzing relationship between and among complicated variables. Additionally, PLS exhibit strong statistical accuracy and reliability than other statistical tool having the power to run multiple regression analysis simultaneously (Tabri and Elliott 2012).

## Result and Discussion

The result and discussion of the analysis of the relationship between the construct of this study

will be in two segments; the first part will discuss the result of the measurement model analysis, while the second part will discuss the result of the analysis of the structural model.

## Measurement Outer Model

The assessment of the measurement model was done in steps; in the first step, the internal consistency of the items was determined where each item indicates a significant contribution in measuring the variable or construct, and in the second step, the measurement model was verified through construct reliability test (composite reliability, convergent validity, and Cronbach's alpha). It is essential in quantitative research in order to meet the requirement for reliability and validity criteria to carry out construct reliability test (Hair et al. 2014).

## Measurement Validity

For this study to meet the measurement validity requirement, convergent validity was carry out by assessing the loadings, average variance extracted (AVE), and composite reliability (CR) as well. As indicated in Table 1, the loadings were all above

**Education Infrastructure and Employment: The Moderating Effect of NGOs, Table 1** Loadings, CR, and AVE

| Latent variables | Items | Loadings | Cronbach's alpha | Composite reliability | Average variance extracted (AVE) |
|---|---|---|---|---|---|
| Edu | E1 | 0.763 | 0.952 | 0.959 | 0.700 |
| | E10 | 0.868 | | | |
| | E2 | 0.788 | | | |
| | E3 | 0.863 | | | |
| | E4 | 0.887 | | | |
| | E5 | 0.836 | | | |
| | E6 | 0.863 | | | |
| | E7 | 0.802 | | | |
| | E8 | 0.839 | | | |
| | E9 | 0.850 | | | |
| Em | EM10 | 0.739 | 0.828 | 0.874 | 0.537 |
| | EM11 | 0.762 | | | |
| | EM12 | 0.747 | | | |
| | EM13 | 0.781 | | | |
| | EM5 | 0.581 | | | |
| | EM6 | 0.770 | | | |
| NGO | N1 | 0.740 | 0.959 | 0.963 | 0.652 |
| | N10 | 0.868 | | | |
| | N11 | 0.840 | | | |
| | N12 | 0.843 | | | |
| | N13 | 0.783 | | | |
| | N14 | 0.731 | | | |
| | N2 | 0.770 | | | |
| | N3 | 0.707 | | | |
| | N4 | 0.877 | | | |
| | N5 | 0.806 | | | |
| | N6 | 0.904 | | | |
| | N7 | 0.765 | | | |
| | N8 | 0.821 | | | |
| | N9 | 0.820 | | | |

the standard value of 0.4 (Hair et al. 2014). The CR, CA, and rho- were all greater than 0.6; similarly, AVE value was greater than the threshold of 0.5 (Hair et al. 2014) (Fig. 1).

Fornell and Larcker (1981) loading and cross loading techniques were used by this study to assess the discriminant validity of the construct using AVE-SE and hererotrait (HTMT) matric. Table 2 indicates that the construct has achieved the discriminant validity test as the diagonal values of the construct were greater than the horizontal and vertical values.

This study assessed HTMT by adopting a threshold of 0.85 as suggested by Tabri and Elliott (2012), and any value less than the adopted value indicates discriminant validity. As shown in Table 3, this study has achieved discriminant validity as the highest value in the matrix is 0.492 which is less than the adopted threshold of 0.85.

## Testing of Hypotheses

This study analyzed moderating effect of NGOs on education infrastructure and employment as well as direct effect of education infrastructure on employment using bootstrapping, and the result for moderating effect shows that B = 0.159, SE = 0.017, TV = 1.3544, and $P = 0.088$; therefore, the hypothesis which says NGOs moderate the relationship between education infrastructure and employment is not supported, while the direct effect of education infrastructure on poverty shows that there exists positive relationship as, thus, B = −0.197, SE = 0.042, TV = 4.682, and $P = 0.000$; therefore, the first hypothesis which says there is significant relationship between education infrastructure and employment was supported. The result of this analysis is indicated in Table 4 and Fig. 2, respectively.

**Education Infrastructure and Employment: The Moderating Effect of NGOs, Fig. 1** Measurement model

**Education Infrastructure and Employment: The Moderating Effect of NGOs, Table 2** Fornnell and Larcker discriminant validity criteria

| **NGO** | 0.646 | 0.492 | |

**Education Infrastructure and Employment: The Moderating Effect of NGOs, Table 4** Result of the structural model assessment (hypothesis testing)

| Relationship | Beta | Std err | T values | *P* Values |
|---|---|---|---|---|
| **EDU∗NGO → Employment** | 0.159 | 0.117 | 1.354 | 0.088 |
| **Edu → Employment** | 0.197 | 0.042 | 4.682 | 0.000 |
| **NGO → Employment** | 0.353 | 0.046 | 7.617 | 0.000 |

**Education Infrastructure and Employment: The Moderating Effect of NGOs, Fig. 2** Structural model

**Education Infrastructure and Employment: The Moderating Effect of NGOs, Table 5** Predictive ability

| Construct | SSO | SSE | $Q^2$ (=1 − SSE/SSO) |
|---|---|---|---|
| Employment | 2400.000 | 2091.836 | 0.128 |

In order to assess the predictive ability of the model, Q-square analysis was employed, and the result shows that dv has possessed a predictive value of 0.128 as indicated in Table 5.

## Discussion

Using the PLS statistical tool, this study has investigated the direct relationship between education infrastructure and employment and the moderating effect of NGOs on education infrastructure and employment. Firstly, the relationship between education infrastructure and employment was analyzed through bootstrapping, and the result indicated a significant relationship as shown in Table 5 and Fig. 2, respectively. Secondly, the moderating effect was analyzed, and the result reveals that NGOs did not moderate the relationship between education infrastructure and employment.

This result has provided yet another evidence that, education infrastructure is a leeway out of poverty, and this finding is in line with theoretical and empirical findings from other studies (Stampini and Davis 2006; Mirica 2014; Seth and Francois 2014; Elima 2015). On the moderation, the result did not support the hypothesis which says that NGOs moderate the relationship between education infrastructure and employment. This result is consistent with findings from Ahsan and Routray (2007) and Riddell and Song (2011) even though, majority of studies that were conducted were in support of the hypothesis.

The uniqueness of this study and its contribution to knowledge can be seen from the following perspectives. This study has for the first time introduced NGOs as a moderator in development study literature to support the independent variable which has never been done before to the knowledge of the researcher. Additionally, this study has made a breakthrough for upcoming researchers to explore the potentialities of NGOs in supporting development effort in other regions which will invariably add knowledge to development study literature globally. Moreover, for the first time, these two variables were combined in a single model and found their relationship which has hitherto not been done. In addition, the construct of this study and their relationship were majorly investigated in Western and Asian context. Investigating the construct in a different context which is Katsina State, Nigeria, is another uniqueness of this study.

## Implication

One of the major explicit implications for policy maker on employment generation and rural development by extension, as drawn from this study is that education infrastructure (secondary school) has a significant influence on employment which implies that the more people are educated, the higher the chances of being employed. Hence, Government should provide more secondary school in the rural areas to reduce the rate of unemployment among the rural dwellers.

## Limitation and Future Research

One of the limitations of this study was that the 6 items that were used to measure employment by this study were extracted from the researcher's thesis which were 15 items, but due to low loading, some were deleted, remaining only 6 items. Another limitation of this study was that it's correlational in nature which is confined to establishing relationship among and within variables without causal relationship. Future study should consider investigating the causal relationship to overcome this limitation. This is a cross-sectional study which was carried out within a specified period mostly 3–4 years. The future should overcome this limitation by conducting a longitudinal study to compliment the shortcoming of this study.

For the first time, NGOs were used as a moderator in the Nigerian context; future study should be carried out in another context to broaden the understanding of the variables to supplement the findings of this study.

## Conclusion

Conclusively, this study examined the moderating effect of NGOs on the relationship between education infrastructure and employment. The result from the analysis shows that NGOs did not moderate the relationship between education infrastructure and employment. However, the direct relationship between education infrastructure and employment indicates a positive and significant relationship which implies that education infrastructure has the ability for employability of an individual. Findings from this study have proved that in order to facilitate and reduce the rate of unemployment and realize rural development objective, government and other sectors have to come together and work simultaneously to eradicate unemployment and by extension achieve rural development.

Centre for Research and Intervention in Education (CIIE), Porto, Portugal

## Synonyms

Achievement of policy goals; Implementation and enactment of educational policies; Planned changes for education

## Introduction: Definitions

The idea of reform of social systems is associated with the achievement of desirable policy goals and is future oriented. This is the case of education reforms which are planned changes in the way education systems and institutions develop and deliver education.

Education reforms involve the changing of relationships between the state and the national education systems, and institutions. The shift from the concept of governing to governance is of utmost importance. Governance emerged in the context of corporate governance and was appropriated by both the neo-liberal assumptions (Kjaer 2010b) on the retreat of state control and dissemination of models of "good governance" induced by international organizations (World Bank 1992; OECD 1995; European Commission 2001). The tendency to subsume governing to governance (Rosenau and Czempiel 2000; Salamon 2002; Kjaer 2010b; Osborne 2010) emphasizes the central position governance has assumed since the 1990s, based on the assumption that increasing institutional autonomy enhances the efficiency of decision-making processes and the capacity of institutions to respond more actively and effectively to changes occurring in their organizational environment (Amaral and Magalhães 2001). Presently, government and governance are widely recognized as having different meanings (Rhodes 1996; Pierre and Peters 2000; Hughes 2010). Governing refers to the actions taken by the government to politically steer social systems. It corresponds to the way states used to regulate and control societies, social systems, and institutions. In a broad sense, governance refers to the political process of setting goals and the actions taken for their achievement. But in a narrower sense, it refers to the actions taken for the achievement of policy goals, and one might say that governance increases both the fragmentation of public decision making and the degree of interdependence between state and nonstate actors of civil society.

Since World War II, education reforms have been a permanent concern of governments in Western societies. States broadly adopted modernizing assumptions about the organization of schooling and its relationship with the

modernization of economies. National goals and economic development were at the core of the rationalization of educational systems (Popkewitz 1993).

Until the last quarter of the twentieth century, education reforms were mainly enacted by the national states; however, since the 1980s, economic and political globalization, regionalization, and the prevalence of governance over governing have been impinging on the drivers of education reforms reconfiguring the relationships between the state and the systems, and institutions. International organizations such as OECD, UNESCO, and World Bank have promoted transnational guidelines that have been transferred, borrowed, and appropriated by national governments in an effort of convergence (e.g., Ball 1998; Phillips and Ochs 2003). The European Union has been also promoting drivers for education reforms rescaling national policies (Dale 2007), while education, as a national remit, has been preserved. Notwithstanding, across regions and countries education reforms are sharing "similar assumptions, values and characteristics due to the endless flow of information and harmonization of education policies through increased global educational borrowing and lending" (Sahlberg 2006: 2). The effects of political and economic globalization and governance instruments have been influencing public sector policies, which are interconnected with the education systems. This is visible in the so-called Global Education Reform Movement (GERM) (Sahlberg 2006) and the Global Testing Culture (Smith 2016).

## State of the Art: The Role of Ideas in Reforming Education

The idea of education reform relates to policy assumptions on the basis of what is desirable and feasible to cope with external forces and influences and to the need to deal with internal dynamics of the national systems and their institutions. These assumptions are ideas that shape politics which guide educational changes and develop policies on the basis of these seminal ideas. Examples are the Bologna reforms or the European reform of the qualifications framework which envisag the reconfiguration of education and professional training in Europe.

Reforms are political processes that are far from linear and to analytically cope with their complexity the role of ideas comes to the fore, as underlined by discursive institutionalism (Schmidt 2008). Ideas are translated by actors at the different levels into policy drivers and instruments that configure the scope of the envisaged education reforms. Governmental frameworks and actors play a key role in the production and the dissemination of ideas (Mehta 2011) which provide legitimacy and justification to the political processes and instruments involved in the education reforms.

Ideas stem from public philosophies, or *Zeitgeist*, which drive normative assumptions that shape policies and their instruments. For instance, while classical liberalism viewed education as a private good, social democratic liberalism viewed education as a significant public good provided by the state, and radical classical individualism viewed education as an individual's issue rather than a state matter. Public philosophies are meta-ideas providing "a heuristic that tells political actors what aspects of the issue to emphasize and what side to take" and function "as a kind of changing cultural touchstone to which actors can appeal in their efforts to advocate for a particular policy or symbol" (Mehta 2011: 42). These philosophies act as meta-narratives that are embedded in political action and "operate at a presuppositional level of social science epistemology or beyond our awareness" (Somers and Gibson 1996: 63). This is the case, for instance, of "knowledge society and economy" whose primacy has been shaping politics and education policies.

Education reforms reflect and translate public philosophies into normative and cognitive ideas shaping problem definition and problem solution. In this translation process, education reforms are enacted towards the envisaged educational change. Normative ideas are those that "attach values to political action and serve to legitimate the policies in a program through reference to their appropriateness (see March and Olsen 1989)" (Schmidt 2008: 307), and cognitive ideas "provide the recipes, guidelines, and maps for

political action and serve to justify policies and programs" (Schmidt 2008: 306). While the former uses principles and values to legitimate social compliance to policies and programs (e.g., quality of education), the latter provide taken-for-granted assumptions on political procedures that justify political action (e.g., evaluation of education). Actually, education reforms appear as a value by themselves, thus legitimating political action. In this sense, they are driven by normative ideas associated with what is good and worth pursuing. This is the case, for instance, of the assumed need of education systems and institutions to cope with the demands of the qualification of the labor force for the new labor markets, which is reconfiguring political instruments to govern educational changes with an emphasis on skills and competences, rather than on knowledge per se. It is important to underline that policy tools are not neutral instruments for implementation, rather policy tools have political dimensions on their own, and they shape the nature of the policies themselves.

Ideas act either as *explanans* (the explanation) or as *explanandum* (what is to be explained) (Mehta 2011) in the reform endeavors. For example, the political goal of an education reform to improve performance of the students in sciences and mathematics, as it was the case in USA, in the 1980s, enabled OECD to develop expertise in education indicators (e.g., PISA) (Martens and Wolf 2009). Education reforms are driven by ideas which act as *explanans* in that they underline what causes the need to reform and to justify the particular intervention in the education sector. As *explanans*, ideas assume a normative stance and as *explanandum* they shift into pragmatic and feasible ideas justifying education reforms. The problem is when a *proceduralist* approach to education reforms assumes a problem-solving perspective, hindering the fact that the technical approach might reconfigure the normative dimension of the political goals. The tactical use of instruments and procedures to increase comparable data on education systems justifies political action and take-for-granted assumptions, for example, of quality, of transparency, and of effectiveness as drivers of education reforms.

Since the 1980s, education reforms have been influenced by the New Public Management (NPM) perspectives that focus on the specification of goals to be achieved by effective and efficient performance management instruments. Following from Peters and Pierre, "this managerialist innovation has forced organizations [schools and higher education institutions] to clarify what they are doing and what their goals really are" (Peters and Pierre 2016: 39), underlining the cognitive nature of ideas justifying education reforms.

Additionally, findings about NPM-driven reforms have been underlining that "the focus on program by program management tends to divert attention from broader policy goals" (Peters and Pierre 2016: 49). Goal selection is one of the core functions of governance and it is of the utmost importance for education reforms as they are contingent to national and institutional frameworks (laws and rules, financial resources, and personnel).

In Western Europe, the state plays a central role in setting reform goals, as the interaction between state and society is a central component of governance processes in the public education sector. Actually, institutional actors and external stakeholders "are intimately involved in the process of making and then implementing public policies, and therefore are involved directly in governance" (Peters 2015: 27). The literature (Rosenau and Czempiel 2000; Salamon 2002; Osborne 2010; Kjaer 2010a, b) underlines that governance influences the environment of institutions, while regulations, norms, and cognitions are seen as elements of that environment.

## Future Challenges: Policy Implementation, Policy Enactment, and Policy Enablement

In the 1990s, awareness about the role of micropolitics inside the state in the creation of the 1988 legislation and related policy developments in the United Kingdom was underlined by Bowe et al. 1992. More recently, the analysis of the establishment of the European Higher Education Area has

shown that institutional actors entertained different views on the ways norms and values permeate across European, national, and institutional levels. Actors appeared to interpret Bologna according to their own lens, thus generating variation, if not disagreement and tensions. Clearly, such activity has implications for the ultimate fulfillment of policy objectives that rest on the principle of convergence. Policy actors re-construct policy as they adjust the policy framework to their own agendas while inducing policy enactment. Actually, the impact of those who contest and/or interpret policies by convening normative and cognitive ideas enact "in original and creative ways within institutions and classrooms" (Braun et al. 2010: 549) policies conducive of the fulfillment, or not, of political goals associated with education reforms. This cognitive dimension drives reforms legitimated and justified under a specific reform framework focusing, for instance, on evaluation, on autonomy, on quality, on student outcomes, on learning outcomes, or on competences, to mention only a few.

Future challenges relate to the question of whether policy enactment, rather than policy implementation, reinforces the need to address policy coordination in the contexts and settings in which policies are developed. The concept of political coordination incorporates the processes of selection and attainment of political goals, confronting approaches that neglect the factors interfering with the attribution of meanings to the political goal itself.

The major issues which the education sectors will be confronted with rely on how to promote coordination of fragmented decision-making power and political influence. This is crucial, for instance, in dealing with issues regarding social inclusion from the perspective of recognition of differentiated identities. Social inclusion does not fit into any conventional policy domain and the problems being faced by governments require more coordinated interventions, i.e., meta-governance (Peters 2010).

Additionally, the concept of policy enactment was supplemented by policy enablement, specifying that "In the case of education policy, enablement describes the terms through which teachers enact policy" (Carusi et al. 2017: 10). From the standpoint of governance, the concepts of enablement and enactment open up a new set of questions related to the linkages between state and social actors that may involve "diversion from the presumed goals of governance in favor of more specific goals that are linked to the groups" (Carusi et al. 2017: 51). As governance refers to the actions taken for the achievement of policy goals, its exercise, while addressing larger and more comprehensive goals, requires the development of enablement skills (Salamon 2002). The enablement skills are required to horizontally engage actors in collaborative settings and to bring together stakeholders for a common purpose. These skills are necessary (i) for activating networks of institutional actors, (ii) for orchestrating groups of actors to perform for the harmonious implementation of institutional strategies and objectives, and (iii) for modulating rewards and penalties in order to elicit the cooperative behavior required for the independent players in a complex tool network (Salamon 2002).

Future education reforms and governance are faced with the reconfiguration of the concept of policy formation and implementation at the crossroads of the relationships between policy enactment and policy enablement, thus emphasizing the ideational component of politics and policies and clarifying how politics and policies reforming education turn into instrumental and procedural approaches.

# Education Smart Room: Designing an Intelligent Environment for Learning

Suwastika Naidu[1], Atishwar Pandaram[2], Anand Chand[2], Maureen Karan[2] and Jone Lako[2]
[1]School of Management and Public Administration, Faculty of Business and Economics, The University of the South Pacific, Suva, Fiji
[2]School of Business and Management, University of the South Pacific Private Mail Bag, Suva, Fiji

## Synonyms

Education policy; Education smart rooms; Intelligent learning

## Definition

**Education smart room**: These are rooms developed to offer advanced technology-based teaching and learning activities for children.

**Intelligent learning environment**: These are learning environments that use artificial intelligence–based learning programs.

## Introduction

The concept of smart classrooms is derived from the literature based on the smart environment. According to Maheshwari (2016), the use of technology to deliver education has significantly changed the way education is delivered both in the developed and the developing countries. Frequently, a student may not perform excellently in all the subjects; therefore, it is the role of the education to equip the classroom and instructors with effective tools that can make learning more interesting and effective. A smart environment is a generic concept that can be applied in different settings that include education and business settings.

Improving the quality of educational delivery environment is the responsibility of higher education institutions, teachers, students, policymakers, donor agencies, and the community at large. In a number of countries around the world, the improvement in the quality of educational environment can be attributed to the support from the nongovernment organizations (NGOs). In the context of Fiji, many NGOs, such as *Sangam* and *Arya Prathinidhi Sabha* of Fiji, have always played a significant role in improving the overall educational environment by setting up schools, and providing basic resources for the delivery of education in Fiji (Arya Samaj 2017). The commitment of such institutions in ensuring that youths and youngsters of Fiji get the best education has greatly enhanced the quality of graduates produced by higher education institutions annually.

There are a number of definitions of education smart rooms proposed by a number of researchers. Shi et al. (2003) highlighted that there are three important criteria for setting up education smart rooms. These three are: (1) voice recognition, (2) computer vision, and (3) other technologies to enhance the classroom experience. According to Block et al. (2015), education smart room is not a standard model and the design of a smart room will differ based on the category of students who are going to use the smart room. For instance, the education smart room for undergraduate students will be different from the postgraduate and doctoral students because the needs of these students are different. According to Mostefa, the topic on how the learning environment could be improved is by using education smart rooms that has been rigorously debated in the extant literature. Much of the global debate in the area of smart rooms is focused on technology evaluations. This entry will answer two important research questions. These two research questions are as follows:

1. What is the *status* of classroom design in the higher education institutions in the PICs and what could be done to improve the classroom design in the PICs?
2. What is the best layout of classroom design for higher educational institutions in the PICs?

There are two reasons for conducting this research. First, to date, none of the existing studies have examined how the classroom designs have an impact on the delivery of education in the PICs. A number of factors affect the design of the rooms in the PICs. Some of these factors are availability of financial resources, skill of workers, and construction laws. This study seeks to provide a thorough examination of the *status* of classroom design in the higher education institutions in the PICs and identify what could be done to improve classroom design in the PICs. In order to improve the quality of discussions presented in this study, a comparison will be made between classroom design in the PICs and other countries around the world.

This entry is divided into six subsections. This first section provides the introduction. The second section provides theoretical perspectives and literature review related to the research topic. The third section explains the research methodology

used in this study. The fourth section presents research findings and discussions. The fifth section provides theoretical and practical implications of this entry. The sixth section provides the conclusion.

The next section will present the theoretical perspectives related to the literature on education smart rooms.

## Theoretical Perspectives Related to the Literature on Education Smart Rooms

There are a number of studies conducted on how the "context" affects the delivery of education in higher education institutions in different geographical settings (Thistlethwaite 2012; Kirkwood and Price 2013). These studies have used a number of theories to explain how the context affects the quality of education delivery in the different geographical settings (Kirkwood and Price 2013). This study will use Robert Sternberg's the "Triarchic Theory of Intelligence" to discuss how the context affects the delivery of education in higher education institutions in the PICs. According to this theory, the intelligence of an individual can be divided into three categories. These three categories are: (1) analytical skills, (2) creativity, and (3) practical skills. The pioneering author who had developed this theory was Robert Sternberg (Sternberg 1985). According to Sternberg, many existing studies undertaking tests for intelligence have frequently ignored the creativity and the practical skills component required by students to enhance their performance and productivity (Sternberg et al. 2001). According to Sternberg, being intelligent involves three unique components of higher education delivery. These three components are: (1) ability to plan and make decisions, (2) outline of people's actions while implementing their plans, and (3) the skills required for learning purposes (Figlio et al. 2013; Sternberg et al. 2001). The next paragraph will discuss each of the three components in detail.

Firstly, when a student develops the ability to plan and make decisions, there are a number of contextual factors that affects their ability to do this. Students usually use a number of planning tools to make decisions and in this modern technological era, most of these tools are technology enabled and available on a student's mobile phone (Entwistle and Ramsden 2015; Metzler 2017). Integrating the first component of the Triarchic Theory of Intelligence with technology-enabled learning would imply that smart rooms are equipped with all the available technology to facilitate interactive learning. Secondly, student's actions on the design and implementation of plans are determined by the technology and necessary educational tools available in the education smart rooms. Smart rooms usually have voice recognition systems, display boards, touch screen, use whiteboard markers, projectors, and all other forms of effective computer-enabled technology that helps students to enhance their intelligence (Sung et al. 2016). The third component of the Triarchic Theory of Intelligence is acquiring skills for learning purposes. The classroom and lecture theatre design determines the level of organizing and planning skills that are needed by students for learning purposes (Hwang et al. 2015; Lepp et al. 2015). Figure 1 captures how the three components of the Triarchic Theory of Intelligence affect's the higher education delivery environment.

## Literature Review

The concept of quality education delivery is hotly debated in the academic literature and a number of projects have been conducted globally to identify some of the key attributes of education smart rooms (Mikre 2011). According to Block et al. (2015), education smart rooms are fully technology-enabled rooms that are designed to improve education and learning in different environmental context. There are many studies conducted on education smart rooms in the large developed and developing countries (Dabbagh and Reo 2010; Sultan 2010; Abu-Al-Aish and Love 2013). However, none of the existing studies have examined how the classroom design affects the delivery of education in the higher education institutions in the PICs.

**Education Smart Room: Designing an Intelligent Environment for Learning, Fig. 1** Triarchic Theory of Intelligence and smart room design. Source: Developed by the Authors of this paper, (2017)

## Smart Room and Technology-Enabled Learning

Yau et al. (2003) highlighted that smart classrooms assist in facilitating collaborative learning among students. Technology has enabled and improved the quality of instruction as it improves the interaction between the instructor and students and helps in bringing about group collaboration among students. El-Bishouty et al. (2010) proclaim that a learning environment would support and enhance learning activities for students. Shi et al. (2010) explain that an interactive classroom is one where computer technologies are amalgamated into a normal distance learning environment. This enhances learning for students and incorporates the teachers experience in using latest computer technologies.

Moreover, the study of Brill and Galloway (2007) on the use of technology-enabled learning in classroom settings found that there were many universities trying their best to integrate technology in learning in the classroom setting. They argued that investment of millions of dollars in classroom technology is not an appropriate indicator of the use and adoption of the educational technology by the instructors and students. Interestingly, Brill and Galloway (2007) found that there is a positive influence of technology on teaching and learning in the higher education institutions in the USA. Mostefa et al. (2007) found that integrating multimodal and multisensory corpora with appropriate human activity in the lecture and tutorial classrooms will help to generate communication in a number of lecture sites simultaneously.

Nakashima et al. (2009) found that juxtaposing electronics in the design of lecture and classrooms by effectively setting up a networked system greatly enhances students learning in different classroom settings. Sailor highlighted that teaching delivery is about the relationship between the teacher and student. Technology-enabled classrooms help to improve this relationship between the teacher and student. Ramos et al. (2010) argued that smart rooms are designed and aligned to the needs of the users. If the room is designed for workers, particularly, managers and employees, then there would be an emphasis on entertainment, living aspects, and education. This study highlighted that the rooms are designed to improve the satisfaction from the environment in which employees work.

## Key Feature of an Education Smart Room

Xie et al. (2001) highlighted that smart classrooms are similar to other intelligent environments as it has different types of hardware and software modules like projectors, cameras, sensors, face

recognition module, speech recognition modules as well as eye gaze recognition modules. According to Sultan (2010), cloud computing can be integrated into the education smart rooms because it improves the efficiency, effectiveness, and productivity of the higher education delivery. Cloud computing can be divided into three aspects. These three aspects are infrastructure, platform, and software. Poslad (2011) highlighted that education smart rooms should have educationally associated smart devices. Some of the important education smart devices that make student learning more interactive is wireless network–enabled smart phones, tablets, etc. Gikandi et al. (2011) highlighted that online virtual environments can offer applications and tools that would enable the students and the instructors to surpass the interaction that would be present in a face-to-face classroom. Al-Qirim (2011) conducted a study on the use of interactive whiteboard in a university setting in the United Arab Emirates (UAE). The findings from this study showed that interactive whiteboards are more useful in the delivery of technical courses. Stenvall-Virtanen and Nordell (2014) contend that a smart classroom project's main goal is to use a combination of the latest technological teaching tools that will create an education service environment. Stenvall-Virtanen and Nordell (2014) propose that a smart classroom should have three concepts; these are: smart pedagogy, smart learning space, and the teaching solution.

Smart pedagogy refers to different pedagogical methodologies that will allow for more interaction alternatives in the classroom when compared to the traditional teaching environment. The smart learning space refers to physical and virtual teaching spaces; in simple terms, it is the essential furniture and technical specifications of a typical physical classroom and the most vital features of learning platforms. The writers emphasize that the smart learning space should allow for flexibility in the learning process. Smart teaching solutions refer to the different tools and materials that are needed for the learning process which include learning objects, games, and simulators.

Xie et al. (2001) highlighted that some of the reasons for including technology in the education smart rooms are wider access to education, support for lifelong learning, and the learner's flexibility to access to learning whenever they are free. Another reason that technologies were introduced was to capture data, record data, analyze data, and generate reports (Banerjee et al. 2003). For example, the installation of the automated surveillance system in a hospital smart room where a computer automatically captured data from the sensors every night, recorded in a data file, analyzed the data and generated a report showing the activities taking place in the room at different times. The system was generally capable of detecting and classifying all major movements in the room. This is also used in learning environment such as the lecture capture software. This will allow learners to access the soft copy or recorded version for revision.

Block et al. (2015) researched into two universities education smart classrooms. At the Illinois State University, its DeGarmo Hall Smart Lab facility was created for learning to provide the best resource for the educators and students in the twenty-first-century environment. The model includes mobile smart boards, collaboration stations, drag-and-drop table chairs, 3D scanner and printer, steel case buoy wobble chairs, and other technological gadgets. In addition, at the Illinois Wesleyan University, the smart classroom facility contained various technology implements that promote collaborative learning. The model made provisions for the educators and learners in multiple ways to share knowledge within the classroom and study areas.

## Gaps in the Extant Literature

This is one of the pioneering studies that explores how classroom design influences the delivery of higher education in the PICs. This study fills the gap in the existing literature in two ways. Firstly, it explores the *status* of classroom design in higher education institutions in the PICs. This study will also recommend how classroom design could be improved in the higher education institutions in the PICs. Secondly, it explores and proposes a design that would best suit the context of higher education delivery in the PICs. According to Hofstede (2001), the culture of people in the PICs is different and people are slow to adopt

technology in the PICs. As highlighted by a number of authors, the design of educational technology should be determined by the context in which the education is delivered. This entry will account for such differences in the context and propose a room design that would best suit education delivery for students in the PICs.

## Research Methodology

The main aim of this study was to discuss the status of classroom design, and best layout of classroom design in the PICs. Data for this study was collected by using in-depth interviews conducted with five lecturers at the University of the South Pacific. Two lecturers interviewed had around 10 years of teaching experience, two had 10–15 years of teaching experience while one had around 35 years of teaching experience. Thematic analysis was used to analyze the data for this study. The themes for this study were integrated with the research questions proposed above.

The 2D and 3D dimensions of the classrooms were constructed by using the planner 5D software. The next subsection will outline the research findings and discussions.

## Research Findings and Discussions

### Status of Room Design in the Higher Education Institutions in the PICs

Currently, the rooms in the higher education institutions in the Pacific Island countries are designed to facilitate traditional learning. There are only a few "smart rooms" at the higher education institutions in the South Pacific and they are more of a "quasi smart rooms" rather than a fully fledged rooms. More investment needs to be done to ensure that classrooms are fully equipped with appropriate technology that would encourage interactive learning in regional centers. The classrooms in the higher education institutions in the PICs do have a proper power supply, backed by generators, wall fans, blackboards, whiteboards, and desks and chairs. However, in many institutions, it has been noticed that these desks and chairs have been used for a long period of time. As a result of this, due to wear and tear and lack of investment in maintenance of these resources, most of these classrooms are not in proper working conditions. Once of the lecturers stated that:

> . . .I have had the chance to teach in two higher education institutions from the PICs. My length of stay in the first higher education institution was for a short period of time. One of the main problems that I had faced as an instructor is overcrowding in the classrooms. The carrying capacity of the classrooms is not enough to cater for the students enrolled in the course. Frequently, students would be sitting outside the classrooms or sitting on the floor while the instructors are delivering the tutorials. . .

There are also issues raised related to the cleanliness and hygiene of the classrooms. Occasionally, it is noticed that students would dirty the classrooms by throwing rubbish and spilling food and liquid on the study tables. According to one of the participants:

> . . .I noticed that the lecture rooms are mainly clean, but the tutorial rooms are usually dirty. When we talk about educational smart rooms, one of the key components of the education smart room is the hygiene and ventilation of the learning environment. If cleanliness and hygiene of classrooms are not maintained, this will adversely affect the delivery of lectures and tutorials. Students would not be interested in the class and lecturers would be distracted by the bad smell from the food. . .

There are costs involved in maintaining the equipment in the classrooms and lecture rooms. These costs can be divided into two categories. The first cost is the prevention cost which requires implementing preventative measures in place while the second cost is the appraisal cost that incurs as the firm tries to improve the quality of its services. According to one of the research participants:

> . . .It has been noticed that computers are damaged, parts of the computer hardware are stolen and computers are malfunctioning because students are using USBs that are affected by computer viruses. . . there are a number of ways that damages inside classrooms and lecture rooms could be handled. Security camera should be installed in all the classrooms to monitor student's behavior. Installing these resources may be initially costly but would be very helpful in monitoring students' behavior in the classroom and lecture rooms. . .

### What Could Be Done to Improve the Room Design in the PICs?

There are a number of ways how the design of classrooms could be improved in the PICs. Firstly, cloud computing could be integrated in the design and delivery of regional courses. According to Sultan (2010), cloud computing can be divided into three categories and how these could be integrated in the delivery of regional courses in the PICs is explained in Fig. 2.

According to one of the lecturers teaching at a higher education institution in the PICs:

> . . .I have been teaching at a higher education institution in the PIC for a number of years. I think we should include more interactive technology in the delivery of blended courses. The print mode courses are easier to deliver but blended courses need specialized use of interactive technology that must be built in the room so that delivery could be successfully done. Currently, while delivering the blended mode courses, it is difficult to interact with the students who are present in different geographical regions. It would be a milestone achievement if higher education institutions with the help of the government could facilitate this. . .

Secondly, the security system should be strengthened in the tutorial and lecture rooms to ensure that equipments are safe from vandalism and theft. It has been noticed that only a few classrooms have security cameras in place while other rooms do not have these. According to one of the participants of this study:

> . . .Lack of security camera in the tutorial and lecture rooms is one of the reasons why many resources are damaged and vandalized in these rooms. I have noticed that some tutorial and lecture rooms have security equipment while others do not. I think higher education institutions need to invest heavily in this area. . .

The above points raised in this subsection support the Triarchic Theory of Intelligence in two ways. Firstly, this entry argued that interactive technology is important in the delivery of blended and online courses. With the use of interactive technology, students are easily able to communicate with instructors and clarify their doubts and without the use of interactive technology, students are left to assume certain issues as they are not able to clarify their doubts while the lecturer is delivering the course. Secondly, with the use of camera technology, students know that they are continually monitored in the lecture and tutorial rooms, therefore they would take proper care of the equipments provided in the lecture and tutorial rooms.

**Education Smart Room: Designing an Intelligent Environment for Learning, Fig. 2** Integration of cloud computing in the delivery of courses in the PICs. Source: Developed by the authors (2017) by using information from Sultan (2010)

**What Is the Best Layout of Classroom Design for Higher Education Institutions in the PICs?** Based on the focus group meetings, the best layout of classrooms in proposed in Fig. 4. In Fig. 3, an outline is proposed for existing tutorial and small lecture rooms and we are proposing a design for education smart classrooms. According to one of the research participants:

> . . .Currently, only a handful of tutorial rooms are equipped with projector, interactive whiteboards, computer technology etc. There is a greater need for using more interactive computer technology. . .

**Education Smart Room: Designing an Intelligent Environment for Learning, Fig. 3** Existing design of classrooms in the higher education institutions in the PICs. Source: Developed by the Authors by using the 5D Planner Software (2017)

**Education Smart Room: Designing an Intelligent Environment for Learning, Fig. 4** Proposed design of classrooms in the higher education institutions in the PICs. Source: Developed by the Authors by using the 5D Planner Software (2017)

Figure 4 shows the proposed design for the educational smart classrooms – implying that it is a classroom that is equipped with interactive technology that enables students to interact with teachers and instructors without disturbing face-to-face students. Some of the interactive resources that are missing from our existing classrooms are as follows:

- Microphones on each table
- Regional students display board
- Writing-enabled user interface
- Laser pointers
- Virtual assistant
- First aid kit
- Fire extinguisher
- Thumb print attendance recorder

## Theoretical and Practical Implications of this Entry

There are two important theoretical and practical implications of this entry. Firstly, this entry integrates the Triarchic Theory of Intelligence to the smart classroom design in the PICs. According to this theory, the intelligence of an individual can be divided into three categories. These three categories are: (1) analytical skills, (2) creativity, and (3) practical skills. In order to acquire these three skills, the classrooms and lecture rooms should be enabled with the proper technology. Using technology-enabled classrooms will help to foster the growth of analytical, creative, and practical skills of students.

The existing debate on intelligence can be divided into two categories. The first argument is that students are naturally intelligent whereas the second argument emphasizes that the study environment helps them to become more intelligent. This entry uplifts the second argument and emphasizes that we can improve the intelligence level of students by using effective technology. If we are not able to interact with students in remote areas, then this implies that only face-to-face students are benefiting from the lectures whereas remote students are not. This study also supports the Triarchic Theory of Intelligence, as technology-enabled smart rooms enable students to use effective tools to plan and implement plans that they have designed for themselves.

## Conclusion

In conclusion, the main aim of this study was to answer two important research questions. These two research questions are as follows:

1. What is the status of classroom design in the higher education institutions in the PICs? What could be done to improve the classroom design in the PICs?
2. What is the best layout of classroom design for higher education institutions in the PICs?

The findings from this study show that the higher education institutions in the PICs have made significant progress toward improving the design of classrooms and lecture rooms. The participants in this study highlighted that some of the problems faced by the lecturers/instructors in the higher education institutions in the PICs are overcrowding, issues related to cleanliness and hygiene and lack of maintenance of resources in the lecture and class rooms. The participants in this study also suggested that there are a number of ways how the delivery of education can be improved in the PICs. Some of these ways are improving the application of technology in the learning environment and provision of right technology to the students.

This study also suggests that the proposed education smart rooms should be designed to incorporate microphones on each table particularly, in the lecture rooms; regional students need to have access to display boards, and writing-enabled user interfaces, laser pointers, and virtual assistant.

One of the limitations of this study is that it is based on small sample size. Future studies should be based on a large sample size.

## Education System in Russia: Sociocultural Reforms

Alexander G. Asmolov
Faculty of Psychology, Lomonosov Moscow State University, Moscow, Russia

The stock theme of this work is the development of conceptualization of a mission and nature of education as a leading social activity participating

in generation of such systematic social and mental effects of the public life as formation of civil, ethno-cultural, and panhuman identity; the dynamics of social differentiation and stratification of the society; adoption of various traditions, values, norms, and behavioral components of attitude for large and minor social groups; acquisition of a repertoire of personal, social, and professional competencies supporting individualization, socialization, and professionalization of a person within the system of individuals and professions; and development of human potential as the most important condition of national competitive performance.

## Definition

Herein we attempt to provide the grounds for the strategy of sociocultural modernization of education as a socialization institution playing a key role in focused development of value systems, norms, mindsets, and behavioral stereotypes of the population of Russia. We reveal the role education plays in modeling of such phenomena of social development as social consolidation of the society, civil identity of representatives of various social groups and national cultures of the local population, social confidence, successful socialization of the oncoming generations, and social stratification of the population of Russia. We also cover the issues of the necessity to consider the effects of sociocultural modernization of education as a growth factor for competitive strength of the individual, the society, and the state in the further design of long-term programs of social and economic development of Russia, including the federal education development program.

## Theoretical Background

The view of education as one of the leading social activities shaping historical and evolutionary process together with the other socialization institutions (family, mass media, religion) originates in the ideas of scientific school of cultural activity psychology by L. Vygotsky, A. Leontiev, and A. Luria and to social constructionism, a congenial postmodern approach in methodology.

Reliance on ideas of nonclassical methodology of cultural activity psychology and on methodology of social modeling of the reality made it possible for us in the period between 1988 and 2008 to propose and develop a set of ideological constructs, which had certain influence on development of national education system:

- "Practical psychology of education" as an attitude toward understanding and support of each student's individual growth as something valuable
- "Diverse education" as an attitude toward design of education which would provide adequate choice of individual education paths for each person (A. Asmolov, Kul'turno-istoricheskaja psihologija i konstruirovanie mirov [Cultural and historical psychology and construction of the realms]. Moscow–Voronezh, 1996, p. 768)
- "Tolerance" as a civilization standard providing sustainable development of an individual as well as social groups within the world of diversity (A. Asmolov, Psihologija lichnosti: kul'turno-istoricheskoe ponimanie razvitija cheloveka [Psychology of personality: cultural and historical understanding of human development]. Moscow: Smysl 2007, p. 528)

As far as their genre is concerned, these ideological constructs refer to specific mindsets called "generative hypotheses" by philosopher A. Losev and historian M. Gefter (Gefter M. A. Tam, gde soznaniju uzko i bol'no [Were the conscious lacks room and feels pain]. Moscow: KDU, 2004, p. 160).

## Renovation of Education: From Structural and Economical to Sociocultural

Let us look at the events of the contemporary history of Russian education from the perspective

of a hypothesis of the necessity for sociocultural modernization (Rol' obrazovanija v konsolidacii i razvitii Rossii. Itogovyj otchet [Role of education in consolidation and development of Russia]. The closing report of NTF No. ERP/F1.1.2.3-C/78/EAC/093-06, 2006) of education and related range of ideas represented in the Public Chamber report "Obrazovanie i obshhestvo: gotova li Rossija investirovat' v svoe budushchee?" (Education and Society: Whether Russia Is Ready to Invest in Its Future), 2007.

When we recall the events of this period in our autobiographical memory, it becomes obvious that Russian education together with the entire country turned into a theater of changes affecting almost every resident of Russia during the last decades. The vector of creating organizational and economic projects in development of education sector has been and still remains a basic vector for the modernization period chronologically dated from 1997. (A. Asmolov, M. Dmitriev, T. Klyachko, Ya. Kuzminov, A. Tikhonov, Koncepcija organizacionno-ekonomicheskoj reformy sistemy obrazovanija Rossii [The concept of institutional and economic reform of the Russian education system]. Poisk No. 38, 1997).

Along with that, even a brief analysis of the contemporary history of education reforms makes it possible to conclude that systemic social and mental effects, generated under influence of education, usually fall beyond the reach of various scenarios of education development:

- Creating personal identity within a polyethnic, polyconfessional, and polycultural state
- Social and spiritual consolidation of the society
- Supporting of social mobility of an individual, equality, and availability of education being the reduction factors for the risks of social stratification of the society
- Construction of social norms of tolerance and mutual confidence among representatives of various social groups, religions, and national cultures
- Successful socialization of the oncoming generation
- Improvement of competitive ability of a person, of the society, and of the state

For the further search of paths of sociocultural transformation of education system, we need to define the field of problems concerning the nature of social and mental effects of education. Further we try to formulate these problems as the following questions:

1. *What kind of risks do politicians and executive officials face when performing education reformation without due regard to social and mental effects of education?*
2. *How does the education influence the following demonstrations of social differentiation and stratification of the society*:
   *"Social elevator" (upward socioeconomic mobility within the system of social ranking of the society)*
   *"Social shaker" (interfusion of various social strata of the society)*
   *"Social well" (downward socioeconomic mobility within the system of social ranking of the society)?*
3. *Which social activities and programs are to be performed in order to switch from declaration of the priority of education as a social value to achievement of actual priority of education as a national policy objective?*
4. *What is the role of a people as a nationhood of Russian society in development of an individual's civil identity as well as in understanding of historical "common destiny?"*
5. *Can education as an institution of individual's socialization be competitive against other institutions for socialization of oncoming generations: family, religion, and mass media?*
6. *How can one turn education management into an actual resource for reduction of various risks and social and interpersonal conflicts, including conflicts arising due to xenophobia, ethnophobia, migrantophobia, social aggression, and intolerance?*
7. *How to map out a course to construction of tolerance norms, social confidence, and mutual understanding within the Russian society through the education, including education system management by means of education standards?*

The complete range of issues mentioned above makes it possible to define the subject matter of sociocultural modernization of education.

In order to outline the ways to justify the very necessity and promptness of similar issues, we refer to analysis of barriers of the collective consciousness preventing construction of ideological attitude toward sociocultural renovation of education.

## Barriers of Collective Consciousness Preventing Modernization of Education

Changes occurring in the society's way of life resulted in outlining of the society's transfer from a relatively stable stage to a dynamic stage of development, from the "closed" society to the "open" society, from the industrial society to the postindustrial information society, and from the totalitarian society to the civil society.

Social, mental, and economic differentiation of the society peculiar to such transfer together with appearance of different forms of ownership became a prerequisite of coexistence of public, private, and domestic education and thus an inevitable social transformation of the entire education system as a whole.

Behind the occurring social changes of the Russian education, there are not only attempts of its targeted reformation performed by governmental authorities, but also numerous poorly controlled and spontaneous processes: some of those processes are particularly related to initiatives of various social groups and others to passive reaction of the education system to various budgetary restrictions. As a result one shall consider the fact that education reformation attempts, including a recent attempt of structural and economic development of education, have been performed against the background of negative social expectations regarding any social reform, peculiar to various population strata and many representatives of education community. There are serious causes for such expectations and disillusions.

- *Disregard of population's motivation during execution of social reforms*

  One of the main faults of social policy of post-Soviet Russia was complete disregard of the population mindset, the psychology of mass consciousness which may crash any social reforms, even those thoroughly calculated but still ignoring motives of people and concealing the meaning of reforms for certain groups of population. Poor efficiency of various state reforms and programs was related to an attempt to perform *administration of complex social systems without motivation or ideology*. In fact we can define the ideology in the context of methodology of social constructionism as *an enterprise of motivation of social behavior, design of motivation for large and minor social groups*.

  Reformers often disregard the fact that **motivational mechanisms of social reforms are as important for their execution as economic ground of various programs of social reformation.** Consequentially, such reforms face severe opposition of mass psychology of the local population as well as in certain cases creation of protest motivation of social behavior performed by various oppositional political groups.

- *Negative experience of preceding reforms in the field of social policy*

  Various attempts to reform education mainly had the following three common characteristics:
  - Predominating interests of professional pedagogical community ("education reformation from the inside")
  - "Reforming from economy" (economical management determinism in designing education development programs)
  - Lack of analysis of political, social, and psychological risks at execution of education reforms related to expectations and motivation regarding the education among different social strata of local population

As a result, first the "market" myths and later the "labor market" myth implicitly turned into a goal of education reforms in itself, and the quality of life and reproduction of human and brain

capital assets were usually confined to "facilities," services, and instruments of market economy.

- *Narrowing down the national policy of education reformation to programs of reformation of education as an independent branch*

In the methodology of design of various education programs (P. Schedrovitskiy, Essays on the philosophy of education, Moscow, 1993), one can detain three target areas on which various education development programs are potentially oriented:

– Educational environment
– Educational sphere
– Educational space (Yu. Gromyko, Design and programming of education development, Moscow, 1996)

In the context of such classification of target objectives, one should from the very beginning realize what is the target of the education development program. When the program is oriented on the **educational space** as on a *target area of program application*, it also comprises such various socialization institutions as the family, the mass media, the religion, the culture traditions and innovations, and so on, which define social development together with the education being a leading social activity.

When the program is oriented on the **educational sphere**, the focus of force application has to be put on *management of education as a specific field* of social and economic development of a state, similar to healthcare service, agricultural and industrial sector, and so on.

And finally, when the program is oriented on the **educational environment**, the program efforts are focused on basic and professional education of an individual within a certain educational institution (kindergarten, school, training college, institution of higher education, etc.)

When the *target area* of the program is the **educational space**, we deal with the genre of designing national educational program (or so-called presidential program). The mission of this education development program is implementation of nationwide ideology and policy which allows achieving such systematic social and mental effects as harmonization of the society, social stratification, improvement of national competitive ability, and formation of a civil identity as a basis for the development of democratic society. In the context of such program, *education acts as a leading social activity generating civil identity and forming people's mentality, values, and social behavioral norms of independent individuals and large and minor social groups*. In such program education standard acts as a social contract, while the improvement of quality, availability, and mobility of education acts as an instrument of securing the education mission. We can characterize a similar national program of education development as a program of *sociocultural renovation of education*. It has the following features:

– Open "subdepartmental" nature
– A forward-looking strategy of social development as an opposition to reactive strategy (education causes social development including creation of labor markets)
– Excessiveness of education as a leading social activity against up-to-the minute market needs
– Innovative management

If the target area of an education development program is the **educational sphere** as one of the social and economic *branches of national development*, we can consider design of federal or regional education development program focused on tasks and technologies of supporting this branch. As a rule such program is characterized by:

– Closed "departmental" nature
– The tendency to narrow program objectives and technologies down to the objectives and technologies of supporting a separate sphere, first of all, to structural and economic tasks of management in educational sphere
– Reactive development strategy as a result of education being governed by the current market requests
– Deideologized nature
– Emergency management

*The programs of education development as a separate branch* are frequently confined to the following two program types: *the compensatory programs and the operational programs*.

*The compensatory programs* are mostly aimed to compensate the lack of funding during the current branch funding process and to develop material and technical instrumentation infrastructure of the education sphere. They frequently degenerate into certain "patch-the-holes" programs in actions of a certain education management system, either federal, or regional, or municipal.

The operational programs are programs aimed at the support of the survival regime and improvement of the already existing education system performed my means of restructuring. These programs have an implicit goal to maintain (or survive) but not to develop.

In education-oriented target programs, innovations are mostly confined to renovation of such regulatory and economic mechanisms of education management as education standardization, improvement of education quality, availability and efficiency, and education mobility being performed by means of *structural and economic reformation in educational sphere*.

We emphasize that various federal and regional programs oriented on development and support of the educational sphere can also increase efficiency of the education, its adaptive capacity within national socioeconomic development.

## From the Premise of Education Priority as a Social Myth to Achievement of the Education Priority as a Task of National Innovation Policy

One of the obvious issues covers analysis of a problem why the thesis *of education priority* as well as *importance of education* (it concerns science as well) is greatly different from the actual state and usually stays among myths, declarations, and good assurances.

In order to prove it, we shall also mention that *the competitive ability of countries of postindustrial development stage is defined by the level of availability and quality of education system*.

It is obvious that Russia has to make education a top priority and that it is a strategic imperative of the nation's state policy, which also has an ideological aspect – to ensure that education becomes a true value in the Russian mentality. Only providing successful solution of the said problem *education can appear as a true resource for increasing the competitive ability of an individual, the society, and the state*.

The Soviet ideology explicitly or implicitly used education, the mass media, and culture to shape the national identity of what came to be known as "a Soviet citizen." The lyrics of a once popular song come to mind, "My address has no block number, and no street – my address is the USSR."

Identity crisis following the collapse of USSR, the Soviet Atlantis sinking to the very bottom of the historical ocean, made the mass consciousness of people of various nationalities, confessions, and regions turn into "homeless consciousness," as shown in various social studies of the national consciousness and identity. (Grazhdanskie, etnicheskie i religioznye identichnosti v sovremennoj Rossii [Civil, ethnic and religious identities in Russia today]/Editor-in-chief V. Magun – Moscow: The publishing house of the Sociology Institute of RAS, 2006, p. 327. Rossijskaja identichnost' [The Russian identity]. The analytical report of the Sociology Institute of RAS. Moscow, 2007, p. 140.) In this situation a proactive ideology specifically designed to shape a new national identity can provide the social "glue" to strengthen the weakened links in Russia's social networks.

In order to meet the goal, it would be a great success to use the education being a socialization institution in order to design norms for the new generation, promoting recovery from the civil identity crisis and formation of a civil society as a society of increasing life opportunities. (R. Darendorf Sovremennyj social'nyj konflikt. Ocherk politiki svobody [The contemporary social conflict. The liberty policy essay]. Moscow, 2002).

Essentially, it is the social design of the identity of an individual as a globally minded person and a nationally minded citizen, which acts as a mission of sociocultural modernization of education and thereby of progress, which Russia makes toward the civil society.

In order to perform this mission, one should also estimate the congruence between education structure and the strategic objectives of Russia's development and form national standards such as conventional norms, which, by means of a social contract, actualize social obligations and requirements of the individual, the family, the society, and the state for education being the institution of anticipatory socialization instead of requirements and ambitions of external observers, where school is an eternal "scapegoat" in charge of all the education faults.

## Risk of Underestimating Social and Mental Effects of Education in Public Policy

The risks of underestimating social and mental effects of education system reflect social attitude toward education and, respectively, toward the results of education as a social activity.

These are some examples of the risks revealed in the process of socialization of the oncoming generation in the contemporary society:

- Lack of distinct strategy of youth policy and support of public associations for children, teenagers, and young people, oriented on solving the problems of individual's identity and youth identity formation
- Crisis of the family as a socialization institution expressed in *maladaptation of the parent family (single-parent family, conflict family, antisocial family)*, family destabilization, and family ineffective performance of its function of socialization and individualization of child's personality
- Rise in social orphanhood
- Phenomenon of child *beggarism*
- Phenomenon of early *commercialization* of teenagers promoting increase of disturbances of moral and ethic development of teenagers and possibility of interaction with criminal social classes
- *Risk of increase of teenagers' aggressive and violent behavior* (destructive actions violating personal and physical security of people and maintenance of material and spiritual values, antisocial sexual behavior, early drug abuse, and antisocial and illegal acts performed in this regard)
- *Rise in infant and juvenile delinquency*
- *Increase in the number of children victims of violence*
- Decrease of age limit for early alcoholism, proliferation of drug addiction, and toxicomania
- Personal immaturity, including moral immaturity
- Inadequate strategies for teenagers' and young people's coping with life obstacles

These are enough to make a conclusion about uncooperation of various social institutions in performing actions aimed at solving problems of preventive treatment of specific defects which we define as *socialization defects* (the family, the mass media, the culture, the pedagogic teams, the law enforcement agencies, the youth organizations, etc.) and arrive at the following conclusions.

**First**, socialization of children, teenagers, and young people generation suffers major changes under the era of mass communications, the Internet, cyberspace, shift of values during the transition stage being undergone in Russia, and so on. Sociological surveys confirm social inhomogeneity of this generation, its multidimensionality, tendencies for breaking of "link of times," and so on. Moreover, Russia as well as foreign countries is *still at the opening stage as far as systematic research programs of the growing generation social profile and role of identity in social development are concerned*.

This is followed by the conclusion that in *education reforms of the preceding periods, various strategies of education advancement have been developed based on quite vague social portrait of the future generation. No need to give detailed*

*reasons for the fact that education reforming against such "generation obscurity" leads to one of the highest risks of any social reforms performed in the present-day world*.

**Second**, even a random sample of the cited examples proves that such traditional socialization institution as the family experiences a profound crisis. Moreover, the family institution fails competition with other socialization institutions, namely, the religion, the mass media, and the Internet. *That is why the system pattern of socialization of the growing generation cannot be regarded without study of interaction of the education institution with such social institutions as the family, the religion institution, and mass communication institution*, which to a large extent define the "zone of proximal development" *of the growing generation* as it can be called after L. Vygotsky, the classic of world psychology. Also, due to many reasons, including departmental barriers, these "cooks" actually spoil the "broth" of the growing generation. No wonder that this generation can spring most sudden surprises for the Russian society.

**Third**, due to the fact that *the social institution of education is the most nationally manageable socialization institution*, it has been and is now burdened with compensation of social defects of other more spontaneous and less manageable socialization institutions, which first of all comprise of the family and the mass media. As a result *the education undergoing though a crisis itself has been and will be anchored with social expectations and political tasks related to compensation of family socialization defects, let alone the defects of powerful non-formal education performed* via *the mass media and the Internet*.

**Fourth**, all the above-mentioned general characteristics of the socialization process of growing generations shall also be considered with due regard to the specific nature of socialization during the historical transition period which Russia undergoes (Otcy i deti: pokolencheskij analiz sovremennoj Rossii [The fathers and the sons: generation analysis of contemporary Russia]/ Authors Yu. Levada, T. Shanin/Moscow: New literature review, 2005, p. 328). The sententia "May you live in interesting times!" can be fully referred to the growing generations' socialization process happening in Russia. The "youth crisis" also known as the "storm and stress age," as the psychologists call it, is traditional for social and age cohort of teenagers. This crisis is escalated by social crisis of transition period and by its ambiguity and shift of values. The *phenomenon of "negative identity"* emerges and strengthens in the situation of value shift; people create associations based on the opposition "friend or foe" and "us-them." (L. Gudkov, Negativnaja identichnost' [Negative identity], Moscow, 2004). The increase of negative identity is expressed in actualization of various xenophobic and nationalistic attitudes as well as in organization of various extremist youth groups. The phenomenon of "negative identity" is especially important for understanding the specific nature of identity formation as a process of teenagers' identification with a certain social group.

If we examine the pattern of socialization process described above more thoroughly, and look at various socialization institutions ensuring this process, that is, the family, the education, the religion, and the mass media, **the *paradox* of education reformation strategy ignoring both education social phenomena and education being the national priority for social impact will become even more evident**.

Without understanding of the systematic nature of the abovementioned social and mental phenomena of education, we turn a deaf ear to design of *education as an institution of successful personal and professional socialization*, providing growth of socioeconomic national resources and promoting growth of national capital by means of human capital accumulation.

We shall also mention that underestimation of a *stratum-forming function of education* as a "social elevator" providing social, professional, and academic mobility of an individual often results in growth of residential segregation and of social and social-psychological inequality of people in education transforming into a kind of a "social well."

Various social effects of education are particularly apparent in preschool education, basic formal education, extended education for children and teenagers, and special education for

physically and mentally low-functioning children. Consequentially, *the society claims education to be responsible not only and not so much for its impact in teaching children but for the negative effects* caused by the defects of all socialization institutions.

All the above-mentioned social effects support existing historical social expectations for pedagogical profession, particularly profession of a teacher, being a social value, and *unconscious belief that education will balance social defects of socialization emerging in the family due to the influence of the mass media and other socialization institutions*.

In case these effects are ignored, federal and regional education programs are confined to the education sphere, and the education is limited to the sector of services, the education shall render being one of the branches of national economy. As a result social and role relations between the society and the education start to be organized in a manner of relations between the clients and education service suppliers. If the state and the society directly or indirectly take up social positions of a consumer and a client toward education, then interaction between them and the education is settled on the principle of pragmatic exchange ("ka me, ka thee"). Consequently, the opposition ("us-them") is being established which obstructs the relations of social partnership between the education, the business, the family, the society, and the state. Within the present social and historical situation, we face the increased risks of formation of the "negative identity" society, being represented by the "no-background" generation.

## Education Standard as a Conventional Norm Reflecting Requirements for Education Results Made by the State, the Society, the Family, and the School

In order to reduce the social risks of social development described above, one needs a conceptually different approach to design basic education standards; (Standart obshhego obrazovanija: na puti k obshhestvennomu dogovoru [The basic education standard: on a way to social contract]. Moscow: Prosveschenie, 2006, p. 39. Standart obshhego obrazovanija: koncepcija gosudarstvennogo standarta obshhego obrazovanija [The basic education standard: the concept of national basic education standard]/under the general editorship of A. Kodakov, A. Kuznetsov. Moscow: Prosveshchenie, 2006, p. 31) the professional pedagogic community has been occupied in search of said approach for many years.

In our opinion one of such approaches to design basic education standards complying with the strategy of sociocultural renovation of education is the systemic activity approach developed within methodology of cultural activity psychology. The systemic activity approach integrates the structural units of a competency building approach and an approach based on behavioral methodology of developing expertise, knowledge, and skills (A. Asmolov, G. Burmenskaya, I. Volodarskaya, O. Karabanova, N. Salmina, Kul'turno-istoricheskaja sistemno-dejatel'nostnaja paradigma proektirovanija standartov shkol'nogo obrazovanija [The cultural and historical systematic and operational paradigm for school education standards design]/The psychology matters No. 4, 2007, pp. 16–23). These approaches were previously used for development of education standards.

There are two integral characteristics in the context of systemic activity approach: *standardization* of education and *variability* of education.

The evolutionary significance of standardization lies in providing stable transmission of cognitive patterns characteristic to a specific civilization development level. In our opinion one shall define three aspects of standardization:

- Standardization as a prerequisite for *adaptation* of oncoming generations to solving a wide range of typical life challenges
- Standardization as an instrument of knowledge management within social, economic, ethnic, and psychological diversity of various social systems
- Standardization as a condition for ensuring the unity of education environment which we define as the "unity of diversity"

The evolutionary significance of variability lies in *development of creative potential* of oncoming generations.

- Variability acts as a prerequisite for *enhancement of personality development* at overcoming life challenges within the diversity growth.
- Variability ensures *administration of alterations* performed in educational systems at federal, regional, municipal, and school levels.

Education *standardization* acts as a tendency characterizing the system of restrictions imposed on the education variability subsequent to the necessity of securing students' equal opportunities *within the education space being the space of the* "unity of diversity."

Education *variability* is regarded as a tendency characterizing, first, the ability of education to correspond with the motives and opportunities of various groups of students and individual features of students and, second, a possibility to manage alterations and innovations within the common education space being the space of diversity.

At large *standardization* and *variability* of education promote both *socialization* and *individualization* of each individual of an oncoming generation *and administration of operations and alterations within the system of education* performed at federal, regional, municipal, and school levels.

There are several main guiding points of designing educational standards defined within the systemic activity approach:

- *Motivation for education and formation of "ability to renew competences"* (Ya. Kuzminov, Obrazovanie v Rossii. Chto my mozhem sdelat'? [Education in Russia. What we can do?]/Voprosy obrazovanija [Educational Studies], Moscow No. 1, 2004, pp. 5–30), defined as the main goal of education in Information Age
- Accent on value systems reflecting requirements and guarantees of the family, the society, and the state toward the conditions ensuring the socially expected quality of education
- Understanding basic education standards as *conventional social norms* ensuring availability, quality, and efficiency of education on the part of the state, the society, the family, and the school and establishing requirements for *education results, set of education spheres, and load scope* at various levels and stages of education, *training terms, structure of sample education programs, and procedures of control* over students' learning achievements on different age stages of individual development of schoolchildren's personality
- Design of versatile psychological and pedagogical technologies of formation of *universal cognitive actions* ensuring solution of training tasks and construction of a worldview on different education stages (Strategija razvitija variativnogo obrazovanija: mify i real'nost' [The variative education development strategy: myths and reality]/A. Asmolov, Kul'turno-istoricheskaja psihologija i konstruirovanie mirov [Cultural and historical psychology and systems' construction], Moscow–Voronezh, 1996, pp. 600–611)

We shall emphasize the fact that within the abovementioned frame of references of education standards, design axiological goal set is a mindset of formation of the worldview of a personality and of motivation for education being the main motivation of individual's development. According to this mindset, the emphasis in designing school standards is, first of all, switched to ensuring a *personal result* obtained in course of education and upbringing. Development of an individual's identity, which is essential for achieving personal self-sufficiency, acts as one of such personal results of education.

## Personal Identity Formation as the Objective of School Education

We have already mentioned above that axiological guidelines of methodology of sociocultural development of education as a major societal activity allow us to set the problem of *forming civil identity, ethno-cultural identity, and panhuman identity* and, as a condition of solving this problem, develop three different types of

model programs consistent with these identity hypostases:

- The complex of model programs to form ***civil identity*** directed at creating a person's identity as a citizen of his/her land, nurturing civil patriotism and love for the Motherland: Russian as the official language, history of the Motherland, native literature, social science, civic studies, and so on
- The complex of model programs to form ***ethno-cultural and regional identity*** (unification with a "minor Motherland" – village, town, region) directed at national enculturation, knowledge of the home region history, and so on: national language as native, regional study, national history, national literature, and so on
- The complex of model programs to form ***pan-human identity***, directed at enculturation with the cultural products of the world at large and the overall history of mankind, panhuman values, and science and technology achievements, making a person akin with all the mankind: mathematics as a universal language for communication, informatics, physics, elementary science, world history, world literature, world arts culture, economics, and so on

The proposed classification of the programs based on "identity," to our mind, provides the opportunity to avoid a mechanical administrative and territorial system of classifying components of the educational standards into federal, regional, and school standard components and to reveal genuine value objectives of education, which should be the aim of the model educational programs.

The described complex of programs for creating the civil identity, ethno-cultural identity, and panhuman identity acts as the condition of adopting normative value characteristics of a personality as a special "ideal type," a representative of civil society (M. Veber, Selected works. M.: Progress, 1990. C. 705–706):

- Self-perception as a Russian society member respecting the history of the Motherland and responsible for its destiny in the modern world and citizen's patriotism
- Positive attitude to adopting the major values of one's own national culture, culture of home area
- Readiness to have a dialogue and cooperation with people of different opinions, national cultures, and creeds; tolerance to opposite view, divergent positions, and different view of the world; and generosity
- Awareness of personal involvement in the destiny of the whole mankind
- Positive attitude to possessing universal ways of knowing the world

In case of a successful overcoming the identity crisis in the context of education as a leading societal activity, there is an increased probability of achieving the following systematic social effects:

- Self-perception of the oncoming generation representatives as the citizens of Russia and the world
- Civil society development
- Growth of the Russian society competiveness in the modern world
- Reducing the risk of the land's disintegration into separate territories by ethnical, confessional, and/or regional parameters and the risk of various social conflicts (ethnical, confessional, interregional, etc.)

The last-named effect directly concerns the identity crisis in our land. That's why we focus on the analysis of this particular social effect of education.

## Education as an Institute of Achieving Social Trust, Tolerance, and Prevention of Xenophobia

In circumstances of growing social diversity in the country, its education system faces more and more prominent tasks of reaching social and psychological harmonization of various social strata, decreasing social strain between members of various confessions and national cultures.

To develop the education as a social institute securing formation of tolerance and prevention of extremism, the following factors of social strain in the society should be taken into account:

- *Growing societal diversity* of social life and complexity of the civil identification process: taking decision about a place of a person (a social group) in the system of civil, social, professional, national, religious, and political relations
- *Uncertainty of values and social objectives* at the level of personality and social group, which emerged as a result of rapid changes in political, economical, and national state systems of the country
- *Growing hypermobility of the population* determined by the dynamics of ethogeographical society structure in the circumstances of turbulent nonregulated migration processes, leading to alteration of social divisions between various ethnical, confessional, generational, and social strata of the society and thus to a greater social strain;
- *Emergence of societal stereotypes of perceiving acts of cruelty*, *xenophobia, ethnophobia, and migrantophobia as a common social norm* and, hence, expressed or implied approval of using negative examples of aggression in actions of certain personalities and social groups, including the ones broadcasted via mass media
- *Active distribution of manipulative technologies of forming a "friend-foe" attitude*, setting up the specter of an enemy, using hate speech in mass media, creating radical "sites of hate" on the Internet, taking aim at the teenagers and the population strata who feel themselves socially deprived

The social monitoring results demonstrate that mass media and family life sphere factually compete against each other in manifestations of intolerance. It is worth mentioning that, by the polling data, *the education sphere is considered as the one where intolerance is least manifested* (G. Soldatova, E. Filileeva, Tolerantnost', social'noe doverie i ksenofobija: opredeljajushhie faktory i gruppy riska [Tolerance, social trust and xenophoby: determination factors and risk groups]. Booklets of the International University in Moscow #6, 2006, C. 154–176). Thus, we can conclude that the society expectations of the education as a socialization institute being able to compensate the defects of the socialization in the family, mass media, and streetwise have a real ground.

Besides these data, there are also noteworthy investigations of social stereotypes formed by mass media and of the value attitudes of teenagers, eyewitnesses, and participants of various traumatic situations, proving that stereotypes of perceiving acts of cruelty, xenophobia, ethnophobia, and migrantophobia *as a social norm* are emerging in modern Russian society.

The abovementioned phenomena most evidently manifest in such social groups as teenagers, migrants, and national minorities. Thus, in the process of monitoring the state of tolerance in teenager subculture (2003), the teenagers while answering the question on what is the widespread attitude in modern Russia toward national, ethnic, religious, and linguistic minority put aggressive nationalism on the first place (18.6%), then racism (17.1%), discrimination (16.4%), violence (14.7%), intolerance (14.4%), and terrorism (13.4%). Only about 2% of the teenagers consider that none of the listed phenomena is common in relation to the abovementioned minorities (Problemy tolerantnosti v podrostkovoj subkul'ture. Trudy po sociologii obrazovanija pod redakciej V. S. Sobkina [Problems of tolerance in teenagers' subculture. Works in education sociology under the editorship of V. Sobkin]. Volume VIII. Issue XIII. M.: Education sociology center at Russian Academy of Education, 2003, C. 391).

Also, the percentage of schoolchildren being indifferent to this problem is revealingly high (28.2%). *Moreover, the alerting fact is that more than a third of respondent teenagers are indifferent to any informal youth groups, including skinheads*.

It should be emphasized that the indifference of a substantial part of teenagers to socially dangerous acts of violence and extremism as a social norm is a strong proof of the necessity to

mandatory enliven the state policy of using the opportunities of education as the institute of creating civil identity, social harmony, and tolerance in Russian society.

These facts testify that the education is able to act as one of the leading factors in creating tolerance and prevention of xenophobic attitudes. At the same time, *the capabilities of general education as a resource of forming tolerance among kids and teenagers are used with extremely low effectiveness*. Moreover, the results of a humanitarian expertise show that school textbooks where the history of mankind development is presented as a history of violence and wars in many ways lead to forming the attitude to settle conflicts by violence as a *social norm*. Considering that, design of the textbooks should necessarily include factual material demonstrating the role of collaboration, cooperation, mutual understanding, latitude in religion, peacefulness, and dialogue in developing various cultures.

On the whole, in the context of developing the sociocultural education remodeling strategy with the purpose of reducing social strain and overcoming the negative social attitudes among teenagers and young people, determined in the process of monitoring, we propose the enhancement of study programs within the education system, which reveals complementary values of various religions, national cultures in the history of civilizations, and multinational modern society. Thus, tolerance by no means acts as the absence of one's own position or indifference to various forms of religious and national intolerance. On the contrary, only a person with his own world outlook and creed is capable to show generosity, to respect the outlook and creed of another person, and to possess the harmony of civil, ethno-cultural, and panhuman identity.

## Certain Tasks of the Sociocultural Modernization of Education

The analysis discussed above allows pinpointing the major tasks of the sociocultural modernization of education. Completing them is, to our mind, essential; otherwise social risks will only grow in the process of societal development of the country.

*The first task of the sociocultural modernization of education is to work out the projects uncovering the essence of education as a leading social activity of the society and implementing these projects in state programs of different levels*. The focus of these target programs is *the educational space as a social network* including the education along with other socialization institutes/family, mass media, religion, and socioeconomical institutes and determining social effects of education interacting with these institutes in the life of a person, society, and state. We have to state that despite the vector of movement toward knowledge-based society lined out in the state policy currently, the connection of education with social effects of societal development and Russian population mentality is very poorly presented in mass consciousness. Hence, the public understanding of the strategy of sociocultural modernization of education and ways of its implementation can become one of the factors motivating the change of the population social attitudes in favor of education.

*The second task of the sociocultural* modernization of education *is related to goal-oriented formation of civil identity as a precondition of strengthening* the society as a "unity of diversity" and solidarity in the sphere of social and interpersonal relations of Russian citizens.

*The third task of sociocultural* modernization of education – *the task of designing programs, in the first place, preschool and school education programs providing development of social tolerance norms and trust as a condition for dialogue of cultures in the multinational Russian society* – is directly connected with solving the task of forming civil identity.

*The fourth task of sociocultural* modernization of education *is the task of compensation for potential risks of the oncoming generations' socialization emerging in other socialization institutes*. We talk about the ways to search social partnership with the institutes of mass media, religion, and family with the purpose of successful socialization of children, teenagers, and young people and

*use of social networks* between these institutes to reduce the risk of social conflicts and strain.

*The fifth task of sociocultural* modernization of education *is increasing the mobility, quality, and accessibility of education as a resource for growth of personal social status in the modern society, achieving professional and personal success, which wakens belief in oneself and the future of homeland. The solution of this problem is directly connected with the strata-forming function of education* will also allow to reduce the risks of social segregation, which to a great extent is a result of a low social mobility and low accessibility of a high-quality education for the population of the country.

*The sixth task of sociocultural* modernization of education *is developing the "competence in replenishment of competences" as the value objective in designing education programs of different levels*, which allows the representatives of oncoming generations to cope with manifold professional and life challenges in the circumstances of steep growth of information flows and tempo of social changes.

And finally, *the seventh task of sociocultural* modernization of education *is developing the general education standards as conventional social norms securing the balance of interests of the family, society, state, and school with regard to reaching the quality education and allowing realization of the life aspirations of the youth*.

These are the priority tasks of sociocultural modernization of education in a most general outline. To allow the sociocultural modernization of education strategy succeed in performing the function of a hypothesis generating mindset and new socioculturally oriented education development programs, it is necessary to do the critical work, which, by the words of Michel Foucault, "...also implies belief in the Enlightenment and... always calls for the necessity to work on our practices, i.e. patient labor shaping the impatience of freedom" (Michel Foucault, Intellectuals and power. Selected political articles. M.: Praxis, 2002, C. 358).

As the examples of the implementation of the strategy of sociocultural modernization of education, below we discuss such projects as "Nasha Novaya Shkola" (Our New School) and "Obrazovanie kak institut socializacii detej s ogranichennymi vozmozhnostjami razvitija v sovremennom obshchestve" (Education as the institute of socializing the children with limited development abilities in the modern society) prepared by the working group of the Ministry of Education and Science of Russian Federation under the direction of V. V. Miklushevskiy (see Appendices 1 and 2).

## Appendix 1

### "Our New School": Social Project to Develop the Personality, Society, and State

"Our New School" educational initiative was formulated in the message of the President of the Russian Federation D. Medvedev to the Federal Assembly. Behind this initiative there is understanding of education as a system creating personality and the mode of life of the people, transferring the national values to new generations, and supporting motivation of a personality toward acquiring knowledge and innovations. Such ideological view of education gives a historical chance to realize creative potential of leading national scientific schools of psychology and pedagogy, considering education as a major social activity and the condition of sociocultural modernization of Russian society. Rewording the well-known utterance of L. Vygotsky, as applied to society development, that the education leads to development, the mission of "Our New School" initiative can be defined by the words: "Our new school is a school leading to the society development."

Thus, to achieve the goal set by the President, it is appropriate to consider "Our New School" initiative a *social* project of developing the

personality, society, and state, which affects the interests of widest Russian society strata.

### General Features and Major Tasks of "Our New School" Project as a Scientific Support of the President of the Russian Federation Initiative Within the System of Russian Academy of Education

***"Our New School" project mission*:** implementation of the nationwide ideology and policy, directed at successful socialization of the oncoming generation (including optimal integration of the children with problems in studying and behavior into the society); achieving such system effects as society harmonization and social stratification; forming civil identity; and developing the national innovation system as the key factor of increasing competitiveness of the country.

***"Our New School" project task***: designing education as a leading societal activity of the society, which forms the mentality, values, and norms of behavior in social groups (including children and teenagers in the groups of social risk) and provides a set of social and professional personal competences.

***"Our New School" target area:*** educational space as a *social network* which includes preschool, general education, additional education of children and teenagers, and education of children of social risk along with other socialization institutes/family, mass media, religion, and socioeconomical institutes and determines the social effects of interacting between the education and these institutes in the life of a person, society, and state.

#### Content Development

**Task 1. Developing the methodology of interdisciplinary analysis and evaluation of risks in the socialization of the oncoming generation as the ground for designing a modern school:**

1. Developing the methodology of forecasting the development of education as the institute of personality socialization
2. Determining the priority directions of interdisciplinary investigations of general education as a socialization institute considering modern trends of science development in the sphere of human social development (development biology, development physiology, psychogenetics, neuropsychology, anthropology and ethnography of childhood, child social psychology, sociology, demography, education economics, etc.)
3. Monitoring of the oncoming generation portrait in the modern society including monitoring of aspirations and professional orientations of teenagers and young people in the modern social development situation and also sociocultural and ethno-regional peculiarities of the educational system development
4. Complex project of investigating the role of general education in forming civil, ethnic, sociocultural, and religious personal identity in modern Russia
5. Developing the strategy of additional education of children and teenagers, providing the motivation to acquire knowledge and creativity
6. Designing modern school as a resource of establishing tolerance, trust, and psychological comfort and a condition for reducing the risk of interdenominational and ethnic conflicts
7. Development and approbation of methods of diagnostics and support of study motivation of schoolchildren as a condition of mastering versatile educational programs
8. Development of a set of innovational programs in the sphere of additional education of children which enables developing study motivation and social orientation for various professions among schoolchildren
9. Creation of a branched system of identification and support of gifted children and follow-up during the whole period of personality development
10. Development of the norms of organizational behavior in educational institutions as the condition of overcoming crises of personality development in the system of general education
11. Development of psychological and pedagogical programs in forming social competence

of children on the stages of the elementary and basic general education
12. Development of technologies of diagnostics, avoiding and preventing social risks in Russian multicultural education space
13. Development and approbation of innovational tutorial game complexes in forming the key competences of the children of preschool and junior school age in the system of additional education

**Task 2. Development of innovative content and technologies of preschool, general, and additional education as the ground for socialization of the oncoming generation, building a civil society and economics of knowledge:**

1. Development of the strategy of complex modernization of content of preschool education
2. Monitoring of psychological well-being and personal development of preschool children and elementary school students as a condition of designing an evolutive educational environment
3. Development and approbation of the criteria system for evaluating the engagement of preschool education into innovational processes based on the flexibility and variability of forms for providing services, support, and a better fulfillment of family potential as an informal education institution
4. Implementation of a new generation of general education standards, including the standards of the system of special education for children with limited health abilities, which include the requirements to the results of acquisition, structure, and conditions of implementing basic educational programs enabling successful socialization of students
5. Development of methodology of evaluating individual achievements of students as a basis for transition to the next educational level
6. Development and approbation of programs of universal actions directed at developing competences of students in making decisions in a wide range of problem situations, including the situations of uncertainty

**Task 3. Development of a strategy of forming a healthy and safe way of life and individual approach to each student, minimizing the children health risks in the learning process in modern school:**

1. Development of the requirements to educational institutions considering preventive care activities and requirements to the results of acquisition of major educational programs from the perspective of developing health and safety culture along with corresponding behavioral patterns among students
2. Development and approbation of programs for students aiming at the formation of foundations of personal safety and prevention of deviating activities among children

**Task 4. Formation of a system of training and support of certified experts engaged in external evaluation of educational institutions within the framework of accreditation:**

Development of a model and normative methodological support of advanced training of certified experts engaged in external evaluation of educational institutions within the framework of accreditation

Infrastructure

**Task 1. Development of the national system for diagnostics and psychological and pedagogical support of cultivation of individual abilities of children at various stages of their life journey:**

1. Development of a system of consultative and methodological support and providing versatile field-specific education, among other things using individual educational programs for students and network interaction of educational institutions
2. Creation of a system of psychological and pedagogical expertise of game products, including computer games, with the purpose of developing study motivation among children of preschool and elementary school age and minimizing risks of disadaptation of preschool children and elementary school students

3. Creation of an evolutive informational Internet resource of game complexes to provide the possibilities of efficient involvement of the children and teenagers in learning intellectual and evolutive games, formation of basic principles of personal and social safety, and arrangement of useful and constructive leisure time
4. Optimization of children's additional education institutions in the directions developing the children's creative interest to media and information technologies and engineering and designing activity
5. Development of infrastructure of the educational institutions for children, requiring psychological, pedagogical, medical, and social assistance, including equipment for psychological and pedagogical diagnostics, correction, and rehabilitation of minors based on modern health-saving technologies using computer technology
6. Creation of a system of crisis support for the children in risk group, which would deal with psychological, pedagogical, and legal support and rehabilitation, aiming at network interaction with educational institutions and providing the monitoring of social successfulness/unsuccessfulness of children with problems of development, learning, and behavior

Human Resources

**Task 1. Creating the system of training and additional training for pedagogical staff of modern school, directed at their professional and personal development:**

1. Monitoring of scientific schools, directions, and collectives providing innovational development of professional training for pedagogical staff of modern school
2. Development of methodology of designing requirements to the content and level of the additional professional training based on social partnership of the state, scientific associations, educational institutions, and the subjects of professional training
3. Developing a program to form social and professional competence of various categories of pedagogical staff of modern school
4. Creating a system of network interaction providing methodological support for the personnel within the system of preschool, general, and additional education
5. Developing a system of upgrading professional competences for executives of institutions of the additional education and for increasing competences in the issues of the additional education of children among directors of general education institutions

**Task 2. Improving the system of personnel training in the area of education quality management:**

1. Improving the system of personnel training to control the quality of education
2. Development, approbation, and implementation of the program of advanced training related to the issues of arrangement and ensuring performance of authorities delegated by the Russian Federation in the field of education
3. Development and approbation of the contents and technologies of conducting qualification tests for specialists dealing with control and supervision in the field of education
4. Development and approbation of additional professional training programs for specialists carrying out control and supervision in the field of education

Economics and Mechanisms of Management and Control

**Task 1. Modernization of organizational, financial, and economic mechanisms of activity of the general education institutions providing optimal investments in human capital:**

1. Development of new mechanisms of organization and funding of the system of the professional training for pedagogical staff and further training, including development of consulting services, methodology support, and qualifications accreditation
2. Improvement of the financial and economical mechanisms of functioning of general education institutions, institutions for the children who need psychological, pedagogical, medical, and social assistance, securing

implementation of the federal state educational standards and increasing efficiency of the budget expenses

**Task 2. Development and implementation of procedures of evaluation of education quality:**

1. Organizational management in conducting the external education quality evaluation with the purpose of developing the basic requirements to the contents and procedures of quality evaluation
2. Evaluation of the state of regional educational systems from the position of priority of regional systems of evaluation of education quality
3. Development of technology and tools of education quality evaluation in elementary school
4. Development of technology and tools for basic general education quality evaluation. Development of technology and tools for the general secondary (complete) education quality evaluation
5. Development of technology and tools for evaluation of quality of actions which general education institutions perform in the questions of personality socialization
6. Creating a system of education quality evaluation and developing basic parameters of the education quality
7. Developing major approaches to forming legal support of the general education quality control system at the federal and regional levels

Informational Support

**Task 1. Organizing a campaign in mass media with the purpose of securing the efficiency of planned actions, coverage of innovational processes in general education system, and also timely detection and setoff against socioeconomic and other risks:**

1. Forming attitudes promoting the enhancement of prestige of general education in modern society using federal and regional mass media
2. Planning and implementation of the project called "Innovations in Modern School and Russian Mass Media: Informational Support and Discussion of Risks"
3. Organization and implementation of measures in covering innovation processes directed at determination of value orientations reflecting the demands and guaranties of the family, society, and state toward conditions, providing for socially expectable general education quality in mass media and the Internet
4. Development of information technologies for rendering legal, psychological, and pedagogical assistance to minors in building healthy way of life and prevention of asocial behavior in the educational environment

E

## Appendix 2

### "Education as an Institute of Socialization of Persons with Health Limitations in Modern Society"

***The mission of the strategic direction***: integration of persons with health limitations into modern society.

***The strategic direction task***: designing education as a resource of social and psychological integration of persons with health limitations into modern society, which provides compensation of various physical and psychological limitations of this category of individuals and also promotes tolerant attitude to them in society.

***Target area*** of the strategic direction: **educational space as** a social network which includes education along with other socialization institutes (family, mass media, religion, social institutes) and determines social effects which interaction between education and these institutes has for personality, society, and state.

Content Development

**Increasing the Accessibility of Education for Persons with Health Limitations**

Improvement of the system of early detection of deviations in physical and/or psychological development and rendering psychological, medical, and pedagogical assistance to persons with health limitations.

Development of innovational models of arranging the education environment providing accessibility of high-quality education for persons with health limitations in the conditions of a

complex modernization of education sphere, which can be differentiated based on the level and direction of education programs (preschool, general, professional education) and variants of receiving the education (in special educational institutions, in the common type educational institutions, at home).

Development of integrated education for persons with health limitations: creation of adaptive environment providing a full-scale integration and personal self-fulfillment of individuals with health limitations in an educational institution of common type (including development of sanitary and epidemiological requirements, federal requirements to educational institutions to minimal infrastructure of the study process and equipment of the classrooms according to the educational needs of individuals with health limitations; development of the system of remote education for persons with health limitations).

Improvement of the tracking and accounting system to ensure that the rights for education of persons with health limitations are respected.

**Improving the Quality of Education for Persons with Health Limitations**

Improvement of the contents and technologies of education for persons with health limitations (including the development of teaching and methodical complexes, electronic educational resources for use in the educational process for the studies of various categories of persons with health limitations, scientific methodological support of the system of maintaining individual educational trajectories of the children in conditions of inclusive education).

Development and implementation of a model of psychological and pedagogical support of the students with health limitations in general and professional educational institutions.

Improvement of the system of rendering psychological and pedagogical support to families nurturing children with health limitations, including education for the parents (other legal representatives) considering methods and technologies of correction and rehabilitation work with the children with developmental disorders.

Infrastructure

**Optimization of the Existing Network of Special Educational Institutions; Development of Teaching and Methodical Centers Providing Consultancy and Methodology Support to Pedagogical Staff of General Educational Institutions and Consultative, Psychological, and Pedagogical Assistance to Persons with Learning Difficulties and to Their Families**

Enhancement of the study processes for the persons with health limitations (building the infrastructure for development and support of innovational activity of educational institutions implementing the programs of general and professional training of persons with health limitations; modernization of the educational information environment for acquiring education by persons with health limitations, including usage of remote educational technologies; creation of regional resource centers for teaching children with health limitations; implementation of new models of occupational guidance and professional training of persons with health limitations).

Human Resources

**Arranging Systematic Psychological and Pedagogical Training, Additional Training, and Advanced Training of Employees of Education Administration, Educational Institutions, and Other Authorities and Entities Dealing with the Issues of Education for Persons with Health Limitations**

Advanced training of the specialists of the executive branch of the subjects of Russian Federation who carry out control in the sphere of education, and managers, specialists of educational institutions dealing with the questions of organization of the studies for persons with health limitations.

Improving the personnel training for educational institutions implementing the professional education programs for persons with health limitations.

Economics and Mechanisms of Management and Control

**Improving Management Efficiency in the Education System and Support of the Programs for**

**Socialization of Persons with Health Limitations**
Elaboration and approbation of the model of introducing normative funding per capita in implementation of the state guaranties of civil right to receive public and free general education in special (corrective) education institutions for students with health limitations.

Implementation of higher standards of funding the education of persons with health limitations in educational institutions of all levels.

Informational Support
**Creating Tolerant Attitudes to Persons with Health Limitations in the Society and Popularization of Ideas of Assisting Them in Receiving Education and Social Integration**
Development of informational and methodological support of the processes of forming tolerant attitude to the students with health limitations and physically challenged persons and popularization of ideas of securing their equal rights to education and social integration.

Monitoring mass media within the investigation of specific features of adaptation and integration of persons with reduced developmental abilities and forming the norms of tolerant attitude to this category of students.

Development of the informational Internet platform on an existing youth resource for persons with health limitations aiming at their adaptation and integration in the peers' environment.

# Educational Inequity in America's Urban Communities

Felix Kumah-Abiwu
Center for African Studies, Department of Pan-African Studies, Kent State University, Kent, OH, USA

## Synonyms

Discrimination; Disparity; Inequality; Inequity

## Definition

Inequity is broadly defined as unfairness, injustice, or inequality regarding a particular situation. Educational inequity is unfairness, injustice, or unequal access to educational opportunities (Welner and Farley 2010).

## Introduction

The power of education to transform personal lives and societies is not only accepted universally, but scholars and policymakers also share the view that access and equity in educational opportunities are critically essential in improving the human condition. This transformative power of education is a good reminder of Nelson Mandela's famous quotation on the value and power of education. According to late President Mandela, "education is the most powerful weapon which you can use to change the world" (Nelson Mandela Foundation 2020). This powerful weapon of education connects well with the mission of the United Nations Educational Scientific and Cultural Organization (UNESCO) which underscores education as a human rights issue.

Given the value and human rights perspectives of education, especially public education in advanced societies such as the USA with vast economic resources as compared to other countries, one would have expected less contentious debates on public education. The preceding statement is quite the opposite when it comes to the debates on equal access to education in the USA, especially in urban communities. In other words, USA is largely characterized by educational injustice with unequal opportunities between urban and suburban school districts to the dismay of many scholars and other observers.

To explore these issues, this entry provides an overview of USA's educational inequity with focus on urban communities. While the words inequity and inequality are closely connected to the broader issues of unfairness and injustice, these two words are also different in many ways. This entry not only acknowledges the differences in meaning of the two words, but also underscores

their interconnections to the broader issues of unfairness and injustice. The entry focuses on public school districts in urban communities, especially African American communities in the USA. The discussion is organized into two parts. The first part examines the conceptualization of educational inequity and the theoretical categories of urban communities with reference to urban public schools. The second part explores the evolutionary phases of educational inequity in the USA. The entry concludes with a reflection on policy ideas/suggestions for policy change.

## Conceptualizing Educational Inequity

As noted, educational inequity is broadly conceptualized as unequal access to educational opportunities, differences in educational resources, quality of instruction, and student outcomes (Welner and Farley 2010). Alternatively, we can also understand inequity through the lens of what equity/equality means. According to Atchison et al. (2017), educational equality is the opportunity provided for all students to receive equal access to the same educational pathways. While policy efforts toward the attainment of equality can be a worthy goal in leveling the unequal educational field, Atchison et al. (2017) have also argued that equality might not necessarily be enough in leveling unequal educational field. Instead, equity in education should be the most important aspect of public education where all students can be offered a unique support for academic success. Notably, the unique support idea of equity takes into account the fundamental consideration that diverse students have unique needs based on their different experiences, cultural backgrounds, and social identifiers such as race, ethnicity, gender, socioeconomic status, and disability which often shape their educational outcomes (Atchison et al. 2017; Klees and Qargha 2014).

Pedro Noguera shares a similar thought on the equity idea. According to Noguera (2019), the reality of the current public school system in the USA is largely characterized by several decades of systemic inequalities where students from privileged backgrounds come into the public school space with an edge or advantage. In this case, as Noguera (2019) has argued, privileged students tend to have an edge due to their access to well-resourced school system with effective teachers, private tutors, advanced course works, and other opportunities that foster predictable educational outcomes. On the contrary, students from under-resourced urban communities have less than stronger educational outcomes due to fewer parental resources and the existence of structural inequalities. To this end, an educational system where students have access to the *exact same* opportunities regardless of their backgrounds constitutes what Noguera (2019) describes as equality.

For some, the equality reasoning seems reasonable within the context of good intentions, but the reality of USA's history of educational injustice raises further questions on the equality argument. To put it differently, as Noguera (2019) has articulated, the centrality of the discourse regarding USA's public education should be about equity, not equality, given the fact that it would be difficult to access equal opportunities for desirable outcomes when a segment of the population, especially African Americans and their communities, is far behind. It thus becomes difficult for urban communities that are far behind due to historically driven structural inequalities to compete on the same playing field with suburban communities. Using a metaphor regarding the ability to "see beyond a fence," Noguera (2019) notes that educational equality practice provides *exact same* opportunities to those with advantage and those without, making those with advantage able to easily "see beyond the fence" on the basis of their already elevated position along the fence. Equity, on the other hand, provides a *unique opportunity* for every student on the basis of their needs, especially those from disadvantaged backgrounds to also "see beyond the fence." Simply put, equity in educational policy and practice should be about the commitment to provide or meet the unique needs of students in the public school system, especially those from marginalized urban public schools to be as successful as those from well-resourced public schools (Noguera 2019).

Another aspect of educational inequity that needs to be underscored is what Paolo Freire referred to as a "decolonized" view of education in his work on the pedagogy of oppressed people. Advancing Freire's ideas, McLaren (1997) argues that the reform of schools toward equity should not only be based on social patterns of representation, but reform programs also need to address what Paolo Freire describes as socioeconomic injustice that is often linked to political and social structures of society with the dominance of European-centered norms and ideas. In other words, a Freirean pedagogy of liberation should underscore the "decolonized" view of education (Freire 1970; McLaren 1997). Similarly, Patel's (2015) work which examines the importance of equitable access to resources and efforts to decolonize formal education and research adds another significant layer to the broader discourse on USA's public education landscape.

With respect to urban public education, this entry draws on the conceptual ideas of Milner (2012) in conceptualizing urban public education. Milner (2012) categorized urban school districts into three typologies. The first typology is *urban intensive*, which describes public school districts that are concentrated in large and metropolitan cities in places such as New York, Chicago, and Los Angeles with more than one million people. These school districts are often faced with huge problems and challenges of limited resources. The second typology is *urban emergent*. This refers to public school districts located in large cities, but these cities have less than one million people. These schools may also experience problems of limited resources as *urban intensive* schools. Cities such as Nashville, Tennessee, Columbus, Ohio, and Charlotte, North Carolina, are a few examples. The third typology is *urban characteristic*, which refers to school districts that are not located in or near large cities, but in suburban or rural communities with some of the challenges often associated with urban schools such as growing number of immigrant population and English language learners with varied socioeconomic backgrounds (Milner 2012; Kumah-Abiwu 2019). With reference to this entry's discussion on educational inequity in USA's urban communities, *urban intensive* and *urban emergent* serve as useful conceptual tools for the broader discussion on the structural inequalities in USA's urban public school districts.

The next section explores the evolutionary phases of educational inequity in the USA. The important questions of interest worth considering are: What explains the inequalities in USA's public school system? In other words, as Fischer et al. (1996) have noted, why do some Americans, for that matter public schools, have a lot more than others? Is inequality caused by a systemic design?

## USA's Educational Inequity: A Historical Perspective

As previously stated, the USA is not only the leading country in the world in terms of the size of its economy, but also leads the world in technological advancement, military capabilities, political/diplomatic power and influence, and home to one of the best institutions of higher learning in the world. With such a status as the leading economic powerhouse coupled with vast resources, one wonders why so much inequality exists in the American society, especially in the public education system (e.g., K-12). Welner and Farley (2010) echoed similar sentiments on the educational system when they argued that the public school system is facing growing and alarming inequities that need urgent national attention. To these scholars, the current public school system could best be described as a dualistic system when it comes to educational opportunities. In this case, as Welner and Farley (2010) have noted, public schools have some children who are doing very well and among the best in the world, while many other children are cast off into unsafe, unsupportive, under-resourced, and unchallenging school environments. Students from large, small, rural, and urban schools, especially those from marginalized urban communities such as low-income households and students of color, specifically African Americans, are left behind with limited chances of academic success (Welner and Farley 2010). What explains these troubling disparities?

For many scholars and other critical observers of the American educational landscape, the interconnections of race/ethnicity, wealth, and education are some of the explanatory factors that have sustained the country's educational inequity for centuries. While recognizing the importance of these factors, this entry focuses on race/ethnicity with emphasis on urban public education for the discussion. Two reasons informed the decision to focus on race/ethnicity. First, the experiences of African Americans with respect to the systemic inequalities they have suffered and continued to suffer seem unparalleled to other marginalized groups. The centuries of racial oppression during slavery, the Jim Crow era of segregation, and the present era of pervasive antiblackness are a few cases in point. Second, the focus on race/ethnicity is also shaped by the entry's scope/expectation of brevity of the subject matter. Notwithstanding the focus on African Americans, some references are made in the entry to other marginalized groups such as Native or Indigenous Americans and Chinese Americans in the discussion.

With respect to the evolutionary phases of USA's educational inequity, this entry draws on scholarly works from the field of public education, especially the work of Noltemeyer et al. (2012) which has captured very well the debates on USA's educational inequity. Like other scholars, Noltemeyer et al. (2012) have examined what is described in the literature as a social justice perspective to education where fairness, respect, and dignity for individuals and groups are underscored. The fundamental question worth asking is: To what extent does the social justice idea of fairness, respect, and dignity for individuals and groups manifest in the American educational terrain? Noltemeyer et al. (2012) have argued otherwise when it comes to the social justice idea and the reality of America's public education. To these scholars, the history of race and ethnicity is not only inextricably linked, but these factors have shaped and continued to shape USA's systemic inequalities.

Starting with the unpleasant experiences of Native Americans, for example, Noltemeyer et al. (2012) have noted that Native Americans were not only subjected to severe forms of oppression by European settlers/colonizers, but boarding schools were established in the 1800s where children of Native Americans were educated through the lens of Euro-centric ethos and values (Noltemeyer et al. 2012; Loring 2009). The forced and unequal system of education was not only limited to Native Americans, but Chinese American children were also educated in segregated schools in California in the 1800s and Latino students in the Southwest region were excluded from the mainstream public school system as well (Noltemeyer et al. 2012). In addition to the instances of racial discrimination/exclusion of Native Americans, Chinese Americans, and Latino Americans, the centuries of systemic oppression and other discriminatory practices against African Americans in USA's educational system, among many other sectors of the society, embodied the country's painful history of race/ethnicity and educational inequities.

## African Americans and Educational Inequity

For many observers, the agonizing odyssey of enslaved Africans who were forcefully taken from Africa to the shores of the so-called New World not only marked a painful chapter in human history, but their arrival to America in 1619 also marked the start of what Noltemeyer et al. (2012) have described as the start of the centuries of their unjust treatments. In addition to the widespread cruelty and mistreatment of enslaved Africans, they were also prohibited from education, except in instances where religious education was allowed to instill fear and psychological control over them. Nevertheless, the strong desire for knowledge and education never escaped the imagination of freed and enslaved Africans (Colon 2003; Kumah-Abiwu 2016).

As generally known, the learning activities of enslaved Africans were mostly held in secret, while some well-meaning Americans, especially the Quakers, helped in the provision of their religious education. Oberlin College in Ohio was the first institution of higher learning to admit free African American students in 1835 (Noltemeyer

et al. 2012). Three historically black institutions of higher learning that were established from the 1830s to the late 1850s also served the higher educational needs of free blacks in the antebellum or pre-Civil War period. These institutions include: Institute for Colored Youth, later renamed Cheyney University of Pennsylvania, was established in 1837. Ashmun Institute, which became Lincoln University in Pennsylvania, was established in 1854. Wilberforce University in Ohio, which was established in 1856, also served the higher educational needs of free blacks (Redd 1998).

Enslaved Africans gained their full freedom from the brutal institution of slavery following the Emancipation Proclamation, end of the American Civil War, and the passage of the 13th Amendment to the US Constitution which abolished slavery in 1865 (Noltemeyer et al. 2012). There is no doubt that African Americans embraced and cherished their new freedom from slavery with respect to legal, civil, and political rights, especially during the Reconstruction era (1865–1877). Unfortunately, the freedom of many African Americans was interrupted with new forms of racial discrimination, especially in the educational system (Noltemeyer et al. 2012). To understand the evolutionary phases of the new forms of racial injustice against African Americans in the educational system, the entry recategorizes and examines the new forms and practices from two historical phases. Phase one explores the period from the end of the Reconstruction era in 1877 to the 1954 *Brown v. Board of Education* landmark decision by the US Supreme Court. Phase two examines the post-1954 (*Brown v. Board of Education*) period to the present era.

## Phase I (1877–1954)

For many, the postslavery era also known as the Reconstruction period was expected to represent an era of rebirth, hope, and promise of citizenship for African Americans, but this hopeful era was short-lived as the unresolved race problem, as Hanchard (2018) describes it, emerged once again within the American society. According to Hanchard (2018), as other scholars have argued, the unresolved race problem that has continued to manifest in discriminatory practices is pervasive within the fabric of the American society. This was exactly the case in the late 1880s when new forms of racial discriminatory practices were introduced to deny the opportunities for upward mobility and rightful citizenship to African Americans. Butchart (2010) captures the preceding assertion very well by stating that the root of USA's educational inequity and discrimination started when African Americans began to demand access to educational opportunities after the end of slavery. White southerners, as Butchart (2010) has argued, responded to the demand by African Americans for education with a crushing force of violence that ranges from intimidation to physical violence against African Americans living in the South. The white resistance took forms such as social shaming, insults, various forms of intimidation, and the refusal to sell lands for the building of schools for African Americans (Butchart 2010).

Besides the violence, intimidation, and other methods of resistance to the educational needs of African Americans, legal means were also introduced during the period under review (*Phase I*) to deny African Americans access to education (Butchart 2010). The Jim Crow or segregated laws that were introduced in the American South from the late 1880s marked a rather destructive era of USA's democratic rule where legal means were used to support inequities, especially in public education. As Johnson and Howard (2009) have suggested, the cherished notion by Americans that education serves as a tool for liberation, empowerment, enlightenment, and economic mobility seems to disappear from the national discourse as a segment of the population was thrown in the orbital space and status as second-class citizens. As the literature has revealed, racial segregation laws in public places in many parts of the South were based on the so-called "separate-but-equal" doctrine (Noltemeyer et al. 2012). One of the most outrageous aspects of the period, it could be argued, was the 1896 decision by the US Supreme Court that upheld the "separate-but-equal"

doctrine in the *Plessy v. Ferguson* case. Simply put, as this entry observes, the US Supreme Court which is expected to protect and uphold the legal rights of citizens failed other fellow Americans by their endorsement of state-sponsored segregation laws against African Americans.

The effects of the "separate-but-equal" ruling were devastating for African Americans as social inequities were perpetuated in two fundamental ways. First, the ruling fortified the practice of the segregated laws, especially in education. Second, the era also marked a significant period in the history of USA's public education where the legal system was used to not only deny good educational opportunities to American citizens, but discrimination and social inequalities were sanctioned and tolerated (Ficker 1999; Noltemeyer et al. 2012). One of the main manifestations of the "separate-but-equal" practice was the establishment of a racially based public school system with benefits for white public schools and burdens for African American public schools. For example, African Americans were not only restricted to segregated and dilapidated public schools, but these schools were under-resourced with limited funding. On the other hand, white public schools were well-resourced and funded (Noltemeyer et al. 2012). The major outcome of the racially segregated public school system was the creation of what Ficker (1999) describes as a second-class education for African Americans as compared to European Americans until the 1954 ruling by the US Supreme Court which banned racial segregation of public schools.

It is clear as the preceding discussions have revealed that America's educational inequity does not appear to be accidental, but the inequity was the product of systematic efforts to deny African Americans the opportunity for good public education. The systematic effort argument is quite consistent with what Fischer et al. (1996) have described as inequality by design which has been shaped by national policies, actions, and inactions to maintain the inequality. The next phase explores the post-1954 era with focus on the trends in USA's educational inequity.

## Phase II (1954 to Present)

The legal collapse of the "separate-but-equal" principle in 1954 marked another important layer of success for equality and justice for African Americans. To explore the trends in America's educational inequity in the post-1954 era, the entry draws on Reardon and Owens (2014) and other scholarly works for the discussion. The discussion is divided into two periods – from 1954 to the 1970s as the first period and from 1980s to the present as the second period.

As the literature has revealed, the expected integration of the public schools after the 1954 *Brown v. Board of Education* decision by the US Supreme Court against the "separate-but-equal" doctrine was a slow process. In the American South, for example, many attempts were made to use other means and strategies to preserve the racial segregation of schools despite the 1954 ruling by the US Supreme Court which banned racial segregation of public schools. One initiative that was introduced was the freedom of choice desegregation plan. The plan shifted the desegregation responsibility to African American families to take the necessary steps in enrolling their children in white public schools. Unfortunately, this option did not appeal very well to African Americans given the hostility of many whites toward the integration of the public schools (Reardon and Owens 2014). In fact, Reardon and Owens (2014) echoed Clotfelter's (2004) point on how public schools achieved little progress on racial desegregation of the schools from 1954 to the mid-1960s. For instance, 81% of African American students in the South still attended majority black schools. Further efforts were made to desegregate the public schools in the late 1960s throughout the 1970s, thanks to the 1968 *Green v. County School Board of New Kent County* decision by the US Supreme Court which mandated schools to initiate further plans toward the integration of the public schools (Reardon and Owens 2014).

The second era (1980s–present era) of the post-1954 phase witnessed what some scholars have described as a gradual process toward the resegregation of America's public schools on the

basis of class (income and socioeconomic) status. Watson (2009) as well as Reardon and Owens (2014) have, for example, observed this trend in their respective works when they noted that the post-1954 phase marked the start of residential income resegregation in the USA as African Americans moved from the rural South to urban areas in the North. The movement of African Americans in large numbers, which is also known as the Great Migration from the South to the North, started from the early 1900s to the 1970s (Tolnay 2003). As African Africans moved into the cities, white families started to move away from the cities to establish suburban communities (Tolnay 2003).

The suburbanization process, as Massey and Tannen (2017) have captured it, not only marked the "American Dream" of home ownership with good public schools in these suburban areas, but the benefits of living in these suburban communities during the suburbanization era were reserved for whites. African Americans were systematically excluded from buying homes and/or living in these suburban communities because of individual and institutional discriminatory practices from real estates and other financial institutions (Massey and Tannen 2017). While the 1968 Fair Housing Act prohibited racial discrimination in housing as the case with the 1974 Equal Credit Opportunity Act which also outlawed racial discrimination in mortgage lending, the enforcement of these laws was not effective to check the discriminatory practices against African Americans (Massey and Tannen 2017).

With decades of policy practices that have supported public school funding from state and local sources with almost half of the funding from local taxes, the implications have been profound and devastating for urban public schools. For example, many urban neighborhoods have continued to suffer from decades of declining property taxes due to disinvestment in these areas, fewer home ownership, and the low market value for homes resulting in less property taxes for public schools in these communities as compared to suburban areas (Obidah and Howard 2005). Ironically, as Obidah and Howard (2005) have noted, many of the urban communities with lower property tax revenue base are areas where a number of tax-free institutions such as universities, hospitals, and art museums are also located.

In addition to the policy issues and structural challenges that are hampering the academic success of many students in urban school communities, other challenges and problems facing most urban public schools also rest on the shoulders of stakeholders such as school administrators, teachers, parents, and students (Obidah and Howard 2005). Issues of racial, cultural differences between teachers and students, classroom management, and the challenges of parental supervision, among others, have been identified as some of the factors creating the achievement gap between urban and suburban schools (Obidah and Howard 2005; Kumah-Abiwu 2019). Notwithstanding, it could still be argued that the unfairness in public school funding is the single most important reason for the educational inequity and huge achievement gap between rich suburban and poor urban school districts (Obidah and Howard 2005). In fact, Meatto (2019) captures this troubling trend by noting that racial segregation in public schools has been outlawed for more than 60 years in the USA, but most public schools remain largely separate and unequal on racial and socioeconomic lines with negative consequences on educational achievements in urban school districts. This point was underscored in a recent report issued by the nonprofit EdBuild. The report, as Mervosh (2019) has observed, reveals that USA's urban public schools that serve students of color received $23 billion less in school funding than white public schools in 2016, although these school districts serve the same number of students.

## Conclusion

The debates on the transformative power of education and questions on the inability to achieve educational equity, especially in the USA have continued to attract attention from scholars and policymakers. This entry has provided an overview of the discourse on America's educational inequity (Welner and Farley 2010; Noguera 2019)

in urban communities with a focus on African Americans. Drawing on the theoretical categories of urban public schools, the entry examined the evolutionary phases of educational inequity across America. The entry explored the educational inequity landscape within the context of two phases. Phase one examined the end of the Reconstruction era to the 1954 (*Brown v. Board of Education*) decision of the US Supreme Court. Phase two explored the post-1954 to the present era.

One of the main obstacles to achieving equity/equality in America's educational landscape, as revealed in the overall discussion of this entry, centers around the calculus of funding public schools, which is based on state and local revenue sources with almost half of the revenue from local property taxes. To achieve the goal of educational equity in USA's public schools, and to follow the core principle of what a *public education* constitutes and should actually look like in terms of *a public good*, policy change needs to occur with an emphasis on an *equitable allocation of funding* from the federal, state, and local governments with less focus on property taxes to fund public schools, regardless of whether these schools are located in urban or suburban communities.

## Synonyms

Educational administration; Educational management; School leadership

## Definition

Educational leadership is defined as the quality and competence of exerting leading influence on educational organization members, teachers and faculty, students, and diverse stakeholders within and beyond certain educational organizations and settings toward the achievement of educational visions and goals. According to organizational levels, educational leadership can be classified as personal leadership, classroom-level leadership, school-level leadership (including preschools, K-12 schools, and higher institutes), and system-level leadership. According to performance style and rationale, educational leadership can be classified as instructional leadership, transformational leadership, distributed leadership, and teacher leadership. Leaders are tending to perform a complexity of diverse leadership styles. The term "educational leadership" also indicates graduate programs in higher education institutions in the field of education.

E

## Introduction

Successful leadership is typically regarded as key organizational property and asset that determines the operation effectiveness of an educational organization as well as the well-being and improvement of the organizational members and students. Especially for turnaround schools, leadership matters significantly.

Leadership is easily mixed with the concept of management. Four criteria were set up by researchers to define the distinction between the two, specifically: management is about the status quo, while leadership is about change; management focuses on the short term, while leadership focuses on the longer term; management is about keeping "the ship" running smoothly, while leadership is about disrupting the status quo; management is about doing things right, while leadership is about doing the right things (Leithwood 2012).

To understand what is educational leadership, it is helpful to learn about educational leadership theories, core domains of educational leadership practice, characteristics of successful educational leaders, and how educational leadership functions to promote student learning.

## Educational Leadership Theories

Current mainstream educational leadership theories include instructional leadership, transformational leadership, distributed leadership, and teacher leadership. In the educational context, these leadership theories indicate distinguished styles and features of different educational leaders.

## Instructional Leadership

Instructional leadership generally indicates educational leaders' trait of excellent mastery and management of curriculum and instruction. Educational leaders with such trait are prone to focus their influence on building educational goals and missions centering around curriculum and instruction, initiating and promoting programs to reform curriculum and enhance professional teachers' instructional skills, and creating positive school learning climate for both teachers and students (Hallinger 2003).

## Transformational Leadership

Educational leaders who possess quality of transformational leadership are more distinguished in diagnosing institutional issues, aligning with system-level educational reform and policy trends, identifying needed changes, appreciating inspirations and innovation, and initiating transformative reforms toward educational goals through execution of systematic changes based on diligent weighing of collective intelligence.

## Distributed Leadership

In contrast to defining styles and characteristics of individual leaders, distributed leadership is a conceptual approach of defining leadership as a situated process of being dynamically distributed among committed members in the educational organizations in specified situations. In different task-based/program-based situations, official positioned educational leaders, teachers/faculty, staff, or even parents can be dynamic role players of empowered leaders, taking actions to influence other members and the organization operation toward specific objectives and the common educational goals.

## Teacher Leadership

Teacher leadership defines the capacities of teacher leaders in the K-12 school settings. Teacher leaders are teachers not only taking charge of classroom instruction but also take on administrative roles beyond the classroom settings in the school system. Teacher leaders' responsibilities include setting up role models among peer teachers in terms of managing classroom and instruction, mentoring new teachers or teachers in need of instructional help, managing teaching and learning, and promoting positive communications and collaborations among teachers toward the goal of enhancing professional development and student learning. Teacher leaders are empowered to make decisions and take on direct influence on teaching and learning on the school level.

## Domains of Educational Leadership Practice

Educational leaders play multitasking roles and exercise leadership qualities through certain patterns of practices in the process of improving organizational development. According to Kenneth Leithwood, on the school level, these practices could be classified into five core leadership practice (CLP) (Leithwood 2012; Leithwood et al. 2006), as follows.

## Setting Directions and Goals

The primary role that educational leaders play is setting explicit, appropriate, and achievable school development directions and goals according to national and provincial policies, local community aspirations and expectations, and the school's collective educational ideals. Formulating a commonly shared vision of the organization's future is regarded as key part of the task, and it functions as significant motivation for the collective efforts to be made for. Educational leaders are also responsible for setting more specific and explicit short-term goals that strategically guide the organization move toward the future visions step by step. Effective educational leaders have expertise in identifying such goals through using data, engaging stakeholders' collective intelligence, encompassing individual

teacher's professional development goals and students' learning goals, and conducting periodical review, evaluation, and upgrading.

## Building Relationships and Developing People

Teachers are the primary capacity and asset of educational organizations. One core practice of educational leaders is building harmonious relationships with the teachers as well as with students, parents, and other stakeholders engaged in the educational organization development. Educational leaders should continuously identify teachers' and students' needs, difficulties, and progress; provide respect, support, and care for individual teachers, staff, and students; create democratic and trusting climate to encourage individual's opposing and innovative ideas; and facilitate opportunities and resources for them to achieve development. Effective leaders set up role models for the organizational members through their personal morale, values, and practice aligning with the organization's visions, and this significantly enhances relationship between such leaders and his followers.

## Developing the Organization to Support Desired Practices

The educational organization is where educational leaders enact their leadership practice. The infrastructure condition of the educational organization constrains the extent to which educational leaders can exert their leadership and meanwhile provides opportunities for them to fully challenge their leadership potentials toward their desired practice and aspirations. Effective educational leaders have faith and belief in making difference of the organization toward their goals and ideals. They make best use of the people's capacity and motivation by restructuring the organization and reallocating resources through distributed leadership strategies in a collaborative culture internally within the school and externally with communities and families beyond the organization.

## Improving the Instructional Program

It is widely proved that teacher quality is the most critical factor influencing student achievement and school development. To staff the instructional programs with good quality teachers is vital practice that educational leaders exercise. Effective leaders have expertise in identifying and recruiting best teachers available and maintaining them from mobility. Effective leaders focus their practice in designing appropriate curriculum and instructional programs aligning with the organization's educational visions and goals, providing instructional support and professional development support to teachers, empowering teachers by distributing leadership, and facilitating supportive resources and opportunities to enhance instruction and student learning. Educational leaders should also have expertise in monitoring quality of the instructional programs through evaluation and assessment of teacher performance and student progress.

## Securing Accountability

Educational leaders are the ones being held most accountable for student achievement and school development. Internally, educational leaders are accountable for teacher force building, and meanwhile, leaders distribute the sense of accountability and commitment into teachers and staff members and keep them accountable for student learning through connection of student achievement evidence with teachers' merit and other teacher evaluation strategies. Externally, educational leaders secure accountability through strengthening bond with all stakeholders including education ministry, school board, families, and local community, create open climate, and establish public reporting mechanism to engage in stakeholders' opinions, feedback, and supervision.

## Characteristics of Successful Educational Leaders

Educational leaders are those who possess and exercise the quality of educational leadership.

The head of preschools, school principals, superintendents, chairs, college deans, university president, directors of educational departments, or even classroom teachers are all regarded as educational leaders in different settings and contexts. Large body of evidence from research literature shows that, no matter on which level or in which context, successful educational leaders share common characteristics and virtues, which consist of the following aspects.

First, in the cognitive perspective, successful educational leaders have distinguished expertise in problem-solving and decision-making processes when faced with challenges and conflicts in the educational settings. Effective leaders have competence and visions in prediction, identification, and judgment of problems and challenges in the organization development process, and they have expertise in allocating resources and increasing the organization's capacity to respond intelligently to the many and complex challenges it faces. Besides, successful leaders also have expertise knowledge about school and classroom conditions with direct effects on student learning. To improve student achievement and facilitate teacher and school improvement, advance educational quality and equity are the common basic goals of educational organizations. Successful educational leaders have shared competency of knowing what and how impacts should be made to advance these goals.

Second, in the social perspective, successful educational leaders share common commitment to the advancement of educational quality and equity. They have sense of mission and responsibility of promoting educational quality and equity in the organizational settings and beyond, and they have broader visions and compassion/sensitivity about social equity. Effective leaders tend to create democratic organizational culture, encourage and appreciate collective thinking, foster open communication among different stakeholders and respect different values, provide greater opportunities for collective learning and teacher development, and welcome innovative ideas and reforms. Successful educational leaders are good at perceiving emotions, managing emotions, and behaving in emotionally appropriate ways.

Third, in the psychological perspective, successful educational leaders share similar personality in terms of being optimistic and positive toward their missions, toward the organizational development, toward the teachers and students, and toward difficulties, challenges, and reforms. They positively take initiatives in situations of complexity and difficulties toward problem solving and decision-making. Their personal optimism usually fosters positive and trusty school climate and enhances morale and job performance of the teachers and faculty. Successful leaders have expertise in weighing priorities and have high efficiency in taking actions. They usually hold high self-efficacy and confidence, and resilience is the highly regarded quality commonly possessed by such group of people. Besides, successful educational leaders are always courageous and rigorous in initiating or welcoming reforms, which is regarded as their motivation of making progress toward the educational goals within the organization, and making difference to the educational quality and equity in broader context.

Educational leaders have formal positional authority and power, and keeping balance between appropriately utilizing the authority and building a democratic, trusty, positive, and progressive organizational environment with all the stakeholders engaged in the mission of promoting educational development is the core of the role. One point to summarize the characteristics of such group of successful educational leaders could be getting the right balance right (Leithwood 2012).

## Functioning Mechanism of Educational Leadership

Knowing about roles and characteristics of educational leadership helps understand how the influence generated by successful leadership practices actually works its way through the school organization eventually and results in more learning for students.

Five core practices show that although educational leaders set up primary goals of promoting student learning as the key for the organization development, their leadership functions more directly on the organization structure and

conditions as well as on teachers and other organization members rather than students. In other words, educational leadership influences student learning through "a backward mapping logic" (Leithwood et al. 2006). To put it simple, students obtain immediate influence from teaching and instruction of teachers in classroom, and teachers obtain direct influence from both students and the educational leaders' leadership style, the organizational conditions and resources which are also impacted by educational leadership, and the wider society. In such logic, teachers stay in the center of the influence process. From the teachers' perspective, since they have dominant authority in private classrooms, how and to what extent they could be influenced depends on the functioning of two types of mechanisms summarized by Lord and Maher (1993): resemblance to individual leader prototypes (recognition-based attributions) and direct experiences with the potential leader (inference-based attributions). The first mechanism works in scenarios unfamiliar and superficial relationship between leaders and the followers, while the second mechanism can be well exampled by scenarios of distributed leadership approach. From the leaders' perspective, they enact direct influence on followers through different types of tactics, such as rational persuasion, consultation, collaboration, and inspirational appeal, as summarized by Yukl and Chavez (2002).

## Conclusion

Educational leadership has contingent nature in that the leaders' own skills and performance change over time; the internal dynamics of their staff change over time, requiring them to adapt in response; their interpersonal relationships with staff change over time; building trust with staff requires significant amounts of time; and much of their influence depends not just on what they do but when they do it (Leithwood 2012). Therefore, educational leaders should have strong contextual sensibility, and keep upgrading, adapting their attributions accordingly.

Educational leadership is partially a born talent, and almost everyone has certain traits and potentials, which could be trained to its full capacity. Aspiring educational leaders can be trained to develop their potentials through educational leadership programs, workshops, and most importantly and efficiently, through practice and experience.

## Definition

Effective communication: communication that succeeds in accomplishing what it was intended to accomplish.

## Introduction

Definitions of "communication" abound, but they are remarkably similar in basic components. One such definition is "the process of sending and receiving symbols with attached meanings" (Uhl-Bien et al. 2014, p. 236). Of first importance, communication is not a "thing" but instead a *process* – one that involves the sending and receiving of messages. Messages may utilize words and other symbolic devices (such as pictures or sounds) or nonverbal ways of signifying meaning (such as facial expressions or body language). However, we have long known that conveying an intended meaning is not as straightforward as we might imagine. Much can "go right" or "go wrong" as an attempt is made to send messages between a sender and a receiver.

Notwithstanding its challenges, communication is fundamental to the human condition and can take on many forms – written, oral, nonverbal, visual, formal, informal, and virtual. Messages can be communicated through different types of media with varying levels of "richness" of information – memo, e-mail, text, videoconferencing, face-to-face conversations, and so on. Thus, communication can be one-way or interactive. It can be intrapersonal (e.g., talking with oneself), interpersonal (social), intergroup, or interorganizational. It can be targeted toward specific stakeholders of an organization or a mass audience. With such a vast array of modes and means of communication, how can one begin to understand what makes it "effective"?

The purpose of this article is to address that question and to unpack some of the factors that impact how communication "works" – i.e., how it might accomplish (or not) what it was intended to do. How can communication be more effective, particularly in an organizational context?

It could be argued that all communication is to some extent strategic, whether consciously so or not. We speak words, write text, or communicate nonverbally (e.g., through facial expressions or body language) in order to accomplish something – a *purpose*. Communication can be initiated for many purposes – e.g., to persuade, inform, command, sell, acquiesce, negotiate, and so on. Identities ("who am I?" and "who are we?") are constructed and changed through interactive communication. Communication also produces widely varying *effects* that are cognitive, emotional, and/or behavioral. It can alarm or comfort. It can *increase* or *decrease* uncertainty, conflict, love, hate, belongingness, distance, optimism, fear, rationality, hope, confidence, resilience, and so on.

Thus, before one can have any basis to evaluate whether communication is *effective*, one must ask, "What is this communicative 'event' or interaction intended to accomplish?" What is its purpose? How can it best accomplish that purpose? How can *unintended consequences* of the communication be minimized, particularly if they are detrimental to that purpose? How can one more systematically approach, understand, and plan communication such that it is more likely to be "effective" – to accomplish what one intended it to do?

## Effective Communication Is a Process

The process model (or "sender-receiver" model) of communication can account for some of the problems involved in accurately sending and/or interpreting messages sent by other persons or groups. Most organizational behavior or communication textbooks include a chapter that features some version of this model (e.g., Uhl-Bien et al. 2014, p. 236). While simplistic, the model does aid understanding of some difficulties in conveying meaning and having it understood by the receiver as intended.

As message senders "encode" their messages (choose how to express them), selections of certain words and symbols are made. However, those same words and symbols must be "decoded" (interpreted) by the receiver of the message, and that is where distortions can interfere with the "pure" transmission of meaning. That is, all sorts of perceptual biases (mental frameworks and shortcuts that we use to interpret "reality" or external stimuli) may erroneously filter or reshape the intended meaning. Cultural differences may assign different meanings to both verbal and

nonverbal cues in communication. More generally, any kind of distortions of the intended meaning or distractions of attention away from a message are referred to as "noise" in the communication process – most of which are unintentional. Such noise can result from communication barriers that are interpersonal, physical, semantic, or cultural.

To mitigate such distortion, effective communication in this process must incorporate a "feedback" loop through some means. For example, a receiver can repeat a message as he or she heard it or ask the sender for clarification. "I hear you saying that you believe that our team is not developing as it should. Is that accurate?" "Please be more specific about what you mean when you say that this report is 'riddled' with ambiguity." Asking for or giving feedback is one way to reduce "noise" or perceptual/cultural biases and to ensure that the intended meaning sent was the actual meaning received. Clarifying feedback can be valuable regardless of the communication medium – written or oral.

## Effective Communication Is Persuasive

However, it is often *not* enough for communication merely to be *understood* correctly – unless it is purely to inform. More often, communication is strategically written or uttered to *persuade* individuals or groups that the message is true, logically sound, valuable (it was worth saying or writing), and therefore worthy of acceptance. The issues raised in the communication process may be small or great – e.g., whether to order sushi or pizza for lunch or whether to develop a new line of products or to seek acquisition of another company that already makes them. Either way, the sender typically wants the receiver to agree with or endorse the message – or at least to maximize his or her own "claim or warrant to be heard" (Potter and Wetherell 1987, p. 108). The *purpose* of such communication is to assert a particular "version" of reality in hopes that it might be validated and legitimated by the receiver(s). Of course, messages can be contested and resisted (as they often should be) rather than blindly validated and so enters the need for the subtle (or sometimes blatant) art of persuasion and influence.

For communication to be persuasive, it must be goal directed, and it must assert *and support* a position on some matter of debate that is open to multiple interpretations or perspectives. Persuasion requires a change of mind (and/or heart) toward a certain issue or choice, and it therefore requires at least some receivers that are of a different opinion or perspective than the sender. Otherwise, there is no "movement" from position A to position B (if everyone already agrees, no persuasion is necessary), and thus no persuasion has taken place. What does it take communicatively to "move" (influence) individuals or groups to change their minds and hearts (to be persuaded)?

## Effective Persuasion Involves Rhetorical Skills: *Logos*, *Pathos*, and *Ethos*

Effective communication, in order to be persuasive, must be logical, moving, and believable. Therefore, it must be cognitively, emotionally, and ethically appealing. Our understanding of the art of persuasion goes back at least as far as Aristotle's three-volume work, *The Rhetoric* (c. 350 B.C.). The Greek philosopher Aristotle (384–322 B.C.) believed that the purpose of public speech was to discover and capitalize on "the means of persuasion" (Book II of *The Rhetoric*). Its efficacy is still studied today by "neo-Aristotelian" rhetoricians. Aristotle argued that the persuasive effects of any speech (or, we could also say, goal-directed communication) depended on the extent to which it was imbued with three qualities that he called "artistic proofs" (referring to the "art" of persuasion). To label these "proofs," he chose three Greek words: *logos*, *pathos*, and *ethos*.

Since many English words derive from Greek root words, the meanings of these terms are intuitive. From *logos* comes the English word "logic." Indeed, *logos* indicates the persuasiveness of words – or more specifically, solid logical arguments. From *pathos* comes "passion" and the persuasive power of emotional appeals – or, as

Aristotle put it, "putting the audience in the right frame of mind" or emotional state to fit the issue at hand (Herrick 2001). *Ethos* easily becomes recognizable as the source of the word "ethics," and it refers to the credibility and integrity established by the speaker in the course of his or her speech. Of the three, Aristotle maintained that *ethos* was most crucial for effective persuasion (Herrick 2001), since it would be difficult to be persuaded by someone whose word could not be trusted – no matter how brilliant the *logos* or *pathos*.

Determining what might be the most effective "means of persuasion" (logical/rational arguments, emotional appeals, and credibility-building devices for any given audience) is therefore the essence of persuasion as Aristotle understood it. Much of that view is still seen as valuable today.

For example, much thought has gone into how one might achieve greater *ethos* (perceived credibility) in communication. Deborah Barrett (2014, p. 11), in her book *Leadership Communication*, has suggested that *ethos* is cultivated by an ability "to see ourselves completely honestly" or as other people perceive us. Since individuals tend to overestimate their credibility as perceived by others, obtaining honest feedback from others is crucial.

Fairhurst and Sarr (1996), in their book *The Art of Framing*, devote an entire chapter to "establishing credibility." *Framing* is a skill that is "required to manage meaning." Meaning involves making sense of a subject and to "judge its character and significance." More importantly, in the process of framing, one set of meanings is chosen and asserted, while other meanings are diminished or rejected. The purpose of communication in framing is then to share the chosen "frame" (meanings) with others with the intent that this interpretation (or perspective) might be "taken as real" while others are not (Fairhurst and Sarr 1996, p. 3; Fairhurst 2011).

In order for framing to be effective, it is vital that the speaker or writer establish credibility. Two essential components that establish a speaker's credibility are *competence* (based on perceived experience, intelligence, knowledge, and so on) and *trust* (based on perceived honesty, open-mindedness, fairness, and so on). The frame that one is attempting to influence others to accept in persuasive communication is dependent on the speaker's believability (or *ethos*) (Fairhurst and Sarr 1996, p. 171).

## Effective Communication Involves Understanding the "Rhetorical Situation"

Lloyd Bitzer (1992, p. 4) is credited with introducing and defining the *rhetorical situation* as "a natural context of persons, events, objects, relations, and an exigence which strongly invites utterance." Bitzer (1992, p. 6) defined *exigence* as "an imperfection marked by urgency; a defect, an obstacle, something waiting to be done." Importantly, unless a communicator can articulate an urgent sense of a need or problem to be remedied (exigence), persuasion falls flat. Indeed, there is no perceived need for it.

A second consideration of the rhetorical situation is an understanding of the *audience* – "those persons who are capable of being influenced by discourse and of being mediators of change" (Bitzer 1992, p. 7). Without a clear idea of whom they are addressing, communicators are simply speaking into the air.

What do communicators need to understand about their audiences? Perelman and Olbrechts-Tyteca (1969) believed that understanding audiences is central to rhetorical persuasion. "Rhetoric inseparably intertwines the concepts of audience and argumentation." Arguments "depend on the astuteness and skill of the audience it succeeds in persuading," as well as their "opinions and values."

Thus, effective communication must be tailored to "be heard" by certain audiences in ways that will be most likely to be understood and accepted by them. Such notions are prescient toward ideas that would later become known as *emotional intelligence* (Goleman 2000, p. 80) – defined as "the ability to manage ourselves and our relationships effectively." Emotional

intelligence consists of self-awareness, self-management, social awareness, and social skill. Akin to that idea is a leadership competence called *perspective taking* (Mumford et al. 2000). Similar to *social intelligence*, it is the ability to understand and address problems from others' perspectives, not simply our own.

In any rhetorical situation, there may be multiple audiences (e.g., different organizational stakeholders such as employees, shareholders, customers, community, society, and so on). Therefore, for messages to be persuasive to a given stakeholder group, messages must be adapted to address differing perspectives, interests, needs, and levels of understanding.

The third element of the rhetorical situation, according to Bitzer (1992, p. 8), is that of *constraints* – "persons, events, objects, and relations that are parts of the situation because they have the power to constrain decision and action needed to modify the exigence." In other words, specific contexts matter, but they differ. Contextual considerations that impinge on any matter at hand need to be taken into account in order to persuade others. Communication that is overly generic, context-free, or too abstract simply will not resonate with hearers "where they live." People must be able to perceive a certain realism and relevance to the communication – that the communicator "understands" and is taking into account (not oblivious to) the context at hand.

Bitzer believed that persuasive communication is a "fitting response" to the rhetorical situation. He viewed the world in *objectivist* terms (that objective realities with clear meanings exist that invite a rhetorical response). However, more contemporary views understand the purpose of communication as *creating* or constructing the rhetorical situation rather than simply responding to it. These theories view situations/organizations as *constituted* by communication (cf. Boden 1994; Vatz 1973). That is, situations/organizations are in a continual state of "becoming," shaped and formed by discourse (Fairhurst and Putnam 2004). It is a matter of two different philosophical views of reality – i.e., objective realism and social construction (Berger and Luckmann 1966). Put simply, does the situation determine communication, or does communication determine the situation?

One could take a "both-and" approach and understand that the arrow goes in both directions between communication and the situation. They can mutually produce, enable, and constrain one another (see Giddens' (1984) theory of "structuration" for a more thorough explanation).

E

## Effective Communication Requires Developing Practical Skills

Leadership books that prescribe effective communication skills are plentiful. Some of the more "trending" communication skills are actually useful ones. Three of these are storytelling, negotiation, and feedback skills.

First, regarding storytelling (narrative), Stephen Denning (2011, p. xiii) observed in his book *The Springboard*: "Time after time, when faced with the task of persuading a group of managers or front-line staff in a large organization to get enthusiastic about a major change, I found that storytelling was the only thing that worked." The efficacy of storytelling is a topic that pervades much of the popular literature on communication, change, and leadership. One may also read about increasing efforts to discover credible evidence behind its effectiveness (e.g., Gottschall 2012).

In literature and public speaking, stories have been employed throughout history to communicate certain principles – from Aesop's fables to Biblical parables. Stories make otherwise complex or abstract ideas more accessible, emotionally moving, and/or actionable. As Denning (2011, p. xv) put it, "Stories can enhance or change perceptions…. They bypass normal defense mechanisms and engage our feelings."

Second, in successful *negotiations*, effective communication skills are crucial – whether one is negotiating a salary or a multibillion dollar contract. *Negotiation* is defined as "the process of making joint decisions when the parties

involved have different preferences," and we know they are effective when substantive differences can be resolved while simultaneously maintaining high-quality relationships between parties (Uhl-Bien et al. 2014, p. 224). Fisher et al. (2011) show how substantive problems and good working relationships are not necessarily conflicting goals if the relationship is based on "mutually understood perceptions, clear two-way communication, expressing emotions without blame, and a forward-looking, purposive outlook."

Third, clear and constructive, supportive *feedback* is crucial to effective communication. It serves multiple purposes, among which are clarifying meaning, praising or blaming, and providing a path to improved performance. Marshall Goldsmith (2007) suggests *feedforward* as overcoming some of the obstacles of negative feedback by focusing on *future improvement* rather than *past performance*. The purpose of feedforward is to provide an opportunity to learn from another person how one can improve in a given kind of competence, like becoming a better listener or a more compassionate leader.

## Conclusion

Effective communication is an interactive process in which meaning is conveyed so that it accomplishes what it was intended to do (e.g., inform, persuade). To persuade effectively, communicators must understand the importance of logical, emotional, and credible appeals. The context, or "rhetorical situation," must also be taken into account and incorporated to craft and deliver the message. Practical skills such as effective storytelling, negotiation, and feedback/feedforward are specific communication competencies that can be developed. In organizing and organizations, beneficial outcomes are not planned or implemented before people communicate. Therefore, organizational members should become the most effective communicators they can be if effective organizing and organizations are the goal.

# Effective Leadership of Government Contracting

Rubén Berríos
Lock Haven University, Lock Haven, PA, USA

## Synonyms

Competitive contracting; Competitive contracts; Contracting officers; Effective leadership; Federal acquisitions; Federal government contracts; Government procurement; Market efficiency; Oversight and accountability; Performance-based; Procurement process

## Definition

Good leadership and management in government contracting are required to generate efficiency and prevent poor performance or abuse. Leadership involves setting goals and developing strategies to achieve those goals, aligning people on the mission, and evaluating results. Management executes strategies, establishes organizational structures, monitors compliance and quality, and rewards performance.

## Introduction

Contracting has been used primarily as a way to reduce government costs and improve governmental efficiency. There is ample evidence that contracting can offer tangible benefits to the government. In a competitive environment, the government can obtain better performance at lower costs from contractors. However, at times, contracting arrangements might offer drawbacks. For instance, adverse events might occur if the wrong firm is chosen to perform a task. There might be moral hazard if the provider fails to perform as desired. Lastly, lapses in accountability might lead to abuse or opportunistic behavior.

Federal agencies contract for all sort of goods and services. Currently, the federal government spends about half a trillion dollars in contracting. That means the federal government has huge buying power. Making effective use of that power requires qualified contracting officers (CO), who are the contract managers. They are prudent government officials who use contract managing tools to ensure successful contractor performance. But each government agency has unique needs and its own special policies and processes for products and services. The policies are not always uniform. In the defense sector, contractors tend to be the largest and most well-established firms, since that is where much of the procurement funding is allocated.

Doing business with the government involves a vast market full of possibilities. The federal market for contracting is for both competitive and sole-source types. The process can be complex, so it is essential to know how to navigate it in order to earn those procurement dollars. The federal government has 15 departments and 68 independent agencies. Government requirements are detailed, and the procurement process consists of several steps. Competing for government contracts requires contractors to follow a step-by-step procedure to meet each agency's needs and to comply with the set of regulations in the FAR that guides government procurement. This is done in large part to safeguard the government from impropriety.

## Effective Leadership in Contracting

Effective leadership refers to the ability to solve or facilitate the solution to specific problems. Effective leaders seek to achieve an objective by using an effective strategy that leads to successful acquisition, execution, and completion.

Kotter (1990) makes the distinction between leadership and management. They differ in their primary function. Leaders articulate their vision, develop a strategy, and enlist the support of a team to produce useful change. Managers keep the system operating through planning, budgeting, staffing, and problem-solving. Management is about procedures and requirements for program success.

Three important areas where leadership will make a difference in government contracting are (1) awarding the contract, (2) dealing with problems that come up, and (3) providing the service. From the contractor's side, building relationships and being strategic to win bids with the government are critical. Establishing a relationship with the government buyer even before the request for proposals (RFP) has been released gives a contractor an edge. Sometimes it pays to find the right partner with credentials to compete for an opportunity to win a bid. Thorough knowledge of federal rules and regulations is necessary.

Successful contractors develop technical competence, good negotiating skills, and a realistic plan of action. They create the conditions needed to succeed in winning contracts and successfully completing them. The process of acquiring a contract starts with identifying well-defined objectives to ensure that the plan will be executed effectively, to set the direction of the negotiations, and to succeed in being awarded the contract.

A successful contractor is one that has technical competence as a team unit, a strong management culture, and people with good negotiating ability. Technical skills are a significant part of the requirement. To be a well-led organization that communicates well, the contracting firm has to have highly competent technical personnel who are team builders, who can solve production and service problems and who are easily adaptable to challenging new situations.

Effective leadership generates effective networking with entities the organization needs to work with to succeed in its mission. Leadership is about creating teamwork, cohesion, and collaboration. The organization must also maintain a favorable reputation by displaying cooperation and a good relationship with the federal government, which is a lifeline to the organization.

Areas of market opportunity where contractors with high win ratios have become more innovative in their approach include emerging markets such as cybersecurity. Leading contractors in these markets tend to assess the opportunity early, use color team reviews, and have developed a capture team.

A reputable and reliable contractor seeks to deliver quality in providing products or services. Quality is often rewarded in future considerations. A successful contractor fosters innovation and change. It encourages creativity and inspires its technical personnel to excel. A successful contractor might have in place a reward or incentive system for excellent performance. These firms have a clear strategy, problem-solving expertise, clear knowledge of past experience, and the ability to inspire their people to lift their game.

In terms of contract preparation, the contractor must be clear about what the government agency needs, its goals, and the amount of risk it can take. The initial process requires research, planning, and preparation prior to negotiation. Once negotiations have been established and requirements have been met, revisions and amendments may be made. Once a contract has been awarded, this is a legal document. The contractor must abide by the stipulations of the contract and comply with the client's needs. Some projects might carry uncertainties.

In terms of contract management, regular audits ensure that obligations are met. When a contract is properly managed, a relationship of trust is established with the government agency. Proper management also can minimize risk and compliance issues. Contract management involves overseeing what has been agreed upon. This requires effective oversight to ensure compliance and to ensure that a cost-effective approach is being taken in managing the contract. Effective contract management requires that the process be implemented correctly, on time, and on budget.

There are numerous statutes and regulations that cover ethics in contracting. The contractor must abide by rules of procurement integrity. Improper conduct that violates ethics rules can result in the government canceling or rescinding the contract. The contractor must disclose pertinent information during the procurement process. Violators making false claims can result, in extreme cases, in disbarment (Curry 2016). With some exceptions, the contracting process is designed to ensure market competition. However, sometimes political connections and the

"revolving door" phenomenon give rise to favoritism, and a particular contractor may receive preferential treatment (Cerrillo-i-Martinez 2017).

A major ingredient in a competitive procurement program is the quality of leadership. A strong leadership team can help the contractor avoid mistakes and missteps in the process of negotiation. Leadership is shown when there are frequent and informative meetings with employees involved in the competition. Consistent leadership instills the importance of a competitive spirit in the team. An effective leader is one who prepares in advance a compelling proposal that has a high probability of winning.

Teaming between companies to win a large contract has become increasingly common. Partnering with others increases the probability of winning large contracts (Smotrova-Taylor 2012). An established government contractor can benefit from small businesses that can form a joint venture partnership, or it can even hire them as subcontractors. The government often prefers to award contracts to proven entities that have performed well and completed other government contracts successfully. Having no past performance with the government might put the potential contractor at a disadvantage.

Since the government is the lifeline for many firms, an established for-profit contractor might have a long list of products or services it can offer it. A proactive contractor can see who buys what, how much, and how frequently. Timing is usually important to compete, sometimes even before the RFP has been issued. Marketing to various agencies is important. The contractor can determine what its capabilities are and how they align with the agency's need. It can also compare its capabilities to those of its competitors. Often the contractor has established key government contacts and built a relationship. Many of today's firms are using social media as a marketing technique and have a website to promote their services (Mlinarchik 2014).

Often there is adequate competition in the bidding process, but in some cases there is market concentration or limited competition, particularly in defense, that can affect cost savings. The procurement process requires technical knowledge, expectations of outcome, and monitoring of performance (Shick 2015). Competition is evident when there are multiple vendors. Competition is less clear when the market is concentrated. The strongest five defense contractors have the lion's share of the market. Long-term contractors can also undermine competition. Situations with limited and imperfect information can lead to higher transaction costs.

## The Government's Role

Government contractual success depends on continuous surveillance and monitoring of the explicit requirements posted, from initiation to closeout. The various agencies of government have well-trained procurement personnel who have to exercise considerable judgment and possess great expertise. For years the federal procurement system has undergone reform to make it more efficient. The acquisition process goes through several steps. There are the critical decisions on planning and articulating the solicitation, evaluating the proposals, negotiating, and awarding the contract. Then comes the contract administration phase, which includes monitoring, evaluating, and maintaining effective oversight. The last phase includes contractor performance and closeout. The most commonly used contracts are (1) fixed priced, (2) cost reimbursement, and (3) sole source. Cost reimbursement is the most commonly used type of contract for intangibles. These types of contracts usually put greater responsibility on the agency to maintain surveillance and monitoring.

Leadership and management in a governmental institution are different. An essential element of the procurement process, leadership at the agency heads goes beyond managerial or administrative duty. For instance, large contracts with DOD would require the intervention of agency top doers. For a successful process to occur, adequate planning in identifying prospective contractors and approaches to solicit their participation is essential. The agency must also have a strong management approach and maintain

comprehensive communication with all stakeholders. It must ensure contracts are properly executed. Much of the responsibility for this lies with the "frontline" supervisors, i.e., contracting officers and contracting officer technical representatives, rather than with managers.

The standard assumption is that public agencies have low-powered efficiency, while private agencies have high-powered efficiency because they compete in the market place (Kelman 2009). But for years there has been an effort to increase performance measurements, and the emphasis has been on achieving greater efficiency by taking a more business, or market-based, approach to management. However, efforts to downsize government over the years have left some agencies more vulnerable to difficulties in holding contractors accountable for cost overruns and lackluster performance.

A current concern is that many technical procurement personnel are due to retire at a time when more contracts are being awarded. This will certainly require more effective leadership to fill the void. Much of the work has fallen to the more seasoned contract managers to negotiate, to follow up on contracts, and to achieve better outcomes. Contracting is a collaborative effort that requires effective coordination of several steps in the process. Leadership will be needed in recruiting, retaining, and training personnel. Contracting officers are required to be diligent and meticulous because of the high stakes. Many COs are motivated by task, mission, and public service (Warren 2014). Government agencies have embraced change and have tried to show more competence in negotiations, but it is a long, tedious process. From the government's standpoint, the aim is to get results and to obtain value (Curry 2016).

Effective leadership in both public and private sectors requires developing competence in negotiations. Good leadership fosters pride in the organization, a strong spirit of cooperation, and teamwork. Effective leadership shows decisiveness, the ability to act in a competent manner, and the ability to make informed decisions, to execute and deliver, and to adapt to changes and innovation (Kotter 1990).

Leadership in government procurement can best be displayed by ensuring that acquisition professionals are adequately trained, empowered, and capable of handling the challenges presented. Contracting, when properly managed, can improve service delivery. The federal procurement system has undergone change, but still needs to better understand leverage spending. Imposing curbs on cost overruns and using more advanced and commercial contracts have helped. Insufficient staffing can result in poor acquisition planning, lax monitoring, and opportunistic behavior on the part of some contractors (Berrios and McKinney 2017; Curry 2016).

Government contracting officers seek to properly manage costs to procure better value for the government, even though proposals are often heavily considered for their technical merit over the cost. GAO (2009) has advised contracting officers to give greater consideration to past performance reports in their decisions on contract awards. On the whole, the contracting process is highly regulated and competitive. However, in dealing with oligopolistic markets and sole-source contracts, the government sometimes does not know the real cost. The government, to the best of its ability, oversees and surveils contractors to make sure they comply with the regulations.

Government contract requirements are extensive. This includes disclosure of cost data. But to ensure good outcomes while minimizing risk, the government has to have a well-established framework and a contract planning team to consider prospective contractors. This is intended to ensure that the government reaps the benefits of competition. A transparent and efficient contract management system enhances the agency's reputation, elevates employee morale, and strengthens government services.

The contracting process requires not only managerial competence but also the ability to inspire the agency's procurement team to aspire to excellence. Contracting cannot be seen simply as a mechanical contract management process. Instead, the government becomes a "smart buyer" that uses strategic management. Its executives take on the challenge to inspire quality and cultivate a motivated workforce that can deliver

(Kelman 2002). To be clear, the government is not just a buyer but also a provider. As such, its technical personnel are using a more businesslike approach to improve operational efficiency. In this approach, performance measurements enable all parties to be held accountable (Curry 2016; Shick 2015; Smotrova-Taylor 2012).

## Concluding Remarks

The federal procurement system is designed to lead the government to decisions that are in the best interest of the taxpayer. The system is highly regulated, but it is, for the most part, competitive. It relies on acquisition professionals to direct all aspects of contract execution. Contracting requires striking a delicate balance between the government's needs and those of a private sector that is willing and able to offer goods and services. The government has to ensure that it can properly manage and use adequate safeguards so that private contractors are motivated to provide the best value and to stay on schedule. Good government management results when, at the executive level, the aim is to set strategy and goals, inspire staff, and instill enthusiasm and public purpose.

The federal procurement system is designed to represent the public interest in dealing with private businesses. Government contracting requires strong procurement and program management; business management skills, giving officials greater discretion to meet goals; and a continuous effort to develop a strong acquisition workforce.

The contracting business provides a public-business relationship. Procurement budgets, particularly for defense, have grown, and contractors have offered a greater array of services, from intelligence to security to border patrol and others. While private contractors are motivated by profit, the government's priority is to obtain best value. For the government, there are undeniable advantages to relying on the private sector, because government provision of many of these services would be more costly and ineffective. However, the large-scale shift to more government contracting has raised new challenges under a leaner government.

# Effective Leadership of Intergovernmental Relations

Paolo Colasante
Institute for the Study of Regionalism, Federalism and Self-Government of the National Research Council of Italy, Rome, Italy

## Synonyms

Multilevel government; Intergovernmentalism; Local and national government policy coordination and conflict

## Definition

Intergovernmental relations (IGRs) are conventionally defined as important interactions between

intergovernmental units of all types and levels. Intergovernmental relations are also defined as an interacting network of institutions at national, provincial, and local levels, created and refined to enable the various parts of government to cohere in a manner more or less appropriate to the institutional arrangements.

It is an evolving system of institutional cooperation that seeks to address the relations of equality and interdependence as defined by the Constitution.

## Introduction

Deil S. Wright (1974), one of the most famous scholars of the IGR, first of all attempted to define the IGR and identified some of their fundamental features. Indeed, it is to him and William Andersen that the first studies for intergovernmental relations are due.

According to Wright, on one side, "several distinctive features of intergovernmental relations set it apart from the more commonplace term, federalism" and on the other hand "IGR encompasses more than is usually conveyed by the concept of federalism," in which attention is focused on the relations between the federation and the member states and not on the interstate relations, which are instead included in the concept of IGRs.

According to Wright, "in short, IGR includes as proper objects of study all the permutations and combinations of relations among the units of government in the American system," but – we could say with William Andersen (1960) – that by now the notion of IGR has spread in systems also different from the USA and now affects other systems.

Also according to Andersen – defined by Wright himself as intellectual parents of the intergovernmental relations – another fundamental element of the IGR is that this concept "necessarily has to be formulated largely in terms of human relations and human behavior."

That means that the IGRs are not institutionalized relationships, but rather "strictly speaking, then, there are no intergovernmental relations, there are only relations among officials in different governing units. Individual interactions among public officials is at the core of IGR. In this sense it could be argued that IGR treats its physiology" (Wright 1974).

From what has been noted so far, it is clear that there are no mandatory elements in the development of the IGRs, but everything is based on a principle of loyal unencoded collaboration that guides the conduct of public officials.

Another element that distinguishes the IGR is that these relations are not one-time, occasional occurrences, formally ratified in agreements or rigidly fixed by statutes or court decisions. Rather, "IGR is the continuous, day-to-day pattern of contacts, knowledge and evaluations of government officials" (Wright 1974).

From this point of view, the model of intergovernmental relations is the keystone of current complex systems, since it is within them that conflict is prevented or avoided.

Hence the conclusion that the leadership of public officials develops within the IGR, as the best place for the implementation of public policies and for conflict management (rectius: avoidance).

## The Reasons for the Development of IGRs: From Powers to Policies

Already at the beginning of the concept of intergovernmental relations, it was observed that a fundamental component of the IGR was the political one, in this distinguishing itself from the classic (legal and institutionalized) tools of federalism (Wright 1988).

In fact, "federalism has, to a large extent, translated questions of policy into questions of law and relied upon the courts for their resolution. Economic and political complexities, combined with rapid rates of social and technological change, have greatly reduced the capacity of courts – and legislatures – to deal with continuous pressures for policy change."

In particular, the transition from "regulatory" policies to "redistributive" policies has led to the emergence of new needs and new power relations, "to which the term federalism could be applied

only with awkward and ambiguous modifiers, such as direct, private, functional, economic."

This is linked to the weakening of the concept of competence in favor of the strengthening of the concept of public services and policies and the creation of new ways of managing public tasks, other than those inspired by a rigid separation of roles and permeated by the loyal collaboration between levels of government.

Literature has not failed to point out that "even when a public policy and a subject can be identified with the same name (*nomen*), that doesn't mean that the two categories coincide. On the contrary, logic leads us to consider that they indicate different legislative and administrative areas" (Mangiameli 2014).

It could even be added that, if the federal terminology is well suited to the concept of competence (on a subject), intergovernmental relations develop instead from the (necessarily cooperative) perspective of public policies.

To understand what has just been said, the literature (Mangiameli 2014) has used the example of "tourism" in the Italian legal system, in which one can speak of both the "tourism" as a subject matter and the "tourism" as a public policy.

The first, which would fall within the exclusive competences of the regions (Art. 117, fourth paragraph, It. Const.), is essentially expressed in the surveillance of the hotel industry and in a limited number of information services and tourism promotion services.

The second, tourism policy, in principle embraces a complex of objects, from the point of view of the division of powers, relating to different subjects, for instance, agriculture, craftsmanship, ports, airports, transport and traffic, cultural and environmental heritage, hunting and fishing, thermal waters, food, land management, sporting organization, professions, and all range of subjects included in the exclusive power of the state, starting from the civil law, the protection of competition, international relations, etc.

Even in the most accredited American literature (Shafritz et al. 2016, p. 136), the complicated nature of intergovernmental relations was underlined: "it's not simply a question of dividing the work between the levels, of assigning local issues to local government, and national issues to federal government. *The majority of issues have national, regional and local implications*."

That's the reason for which the popular image of the federal system as a layer cake, with each layer of government neatly on top of the other, is deceptive. The reality is more like a marble cake. This metaphor holds that the cooperative relations among the varying levels of government result in an intermingling of activities; this is in contrast to the more traditional view of layer-cake federalism, which holds that the three levels of government are totally or almost totally separate.

The literature (Shafritz et al. 2016) recalls the origins of this expression, which is associated with the name of Morton Grodzins (1966), who made the famous example of the rural county health officials called "sanitarians": they acted according to the standards issued by the federation, were paid with funds both of the federation and the member state, and had offices and equipment supplied by the county.

Therefore, in this regard, Grodzins stated that "it is impossible from moment to moment to tell under which government the sanitarians operates."

And this example could be repeated for many other public policies in different legal orders, coming to the conclusion that intergovernmental relations are the main tool to manage public policies and the working method for an effective leadership in the exercise of shared competences in an optics of cooperative federalism (Agranoff 2001).

## The Working Method of the IGR

When it comes to those public policies in which the method just described is adopted, the methods and techniques for managing IGR are very similar all over the world (Trench 2014).

The common pattern includes extensive, more or less routinized coordination involving not just regular ministerial meetings, but extensive liaison by officials, through meetings, individual telephone calls and group conference calls, and email.

But in all systems, such coordination is both a fact of life while lacking in any formal constitutional requirement to take place. It happens because it is necessary, in political or practical terms or both, to make the country work.

These conclusions were already reached in 1955 by the Commission on Intergovernmental Relations (better known as the Kestnbaum Commission, Conlan 2006), providing the political and intellectual basis for the development of federal relations in a cooperative sense.

The birth of IGRs in the Italian system and, in particular, in the context of relations between the state and the regions is more recent but is nevertheless the result of the de facto development of relations between levels of government for the coordinated exercise of powers in the various subject matters.

In fact, the Italian intergovernmental method revolves around the parameter of loyal collaboration (Mangiameli 2008) between levels of government, which is essentially invoked in so-called conference system (state-region conference, state-city conference, unified conference), spontaneously born and in practice, following a parliamentary fact-finding investigation which, in 1980, had underlined the need for the identification of a "seat for a permanent relationship with the central organs of the State and for the participation of the Regions in the elaboration of the general policy lines of the entire State-organization."

Only later, this method of work was enshrined in a decree by the Prime Minister (DPCM October 12, 1983), while it will be necessary to wait another 5 years before the essential discipline of the conferences is inserted into a law and exactly into that which regulates the activity of the government and the legal order of the Presidency of the Council of Ministers (Law August 23, 1988, No. 400, Article 12).

All this shows that the intergovernmental relations in the Italian regional and autonomist system have arisen as a request, not of the regions or of the local autonomies, but of the central state.

In fact, the government of the time considered it important to involve the regions "in relation to the general policy guidelines that could affect regional matters, excluding the guidelines relating to foreign policy, defense, national security and justice."

This also shows that, regardless of the existence of a competence in a certain sector, the levels of government feel the need to coordinate and relate to the other levels involved in some way to achieve an effective exercise of leadership in public policies.

## Conflict Avoidance

Conflict avoidance is a method of reacting to conflict, which attempts to avoid directly confronting the issue at hand.

It is quite evident that if a method is followed inspired by the participation of the different levels of government, the risk of a conflict between levels of government is greatly diminished.

This applies to every system in which the IGRs are developed, but from this point of view, the Italian system offers a rather interesting starting point for reflection, if one considers that there is the so-called bargaining between the state and the regions to prevent the disputes between the state and the regions before the Constitutional Court, according to a model experimented also in the Spanish legal system (Sanjaume-Calvet and Grau Creus, 2017).

In particular, according to Articles 127 and 134 of the Italian Constitution, both the state and the regions can challenge a law of the other level of government (and also an act without legislative nature) to protect their powers, when they consider that they have been invaded thereby.

The term for action is very short, being only 60 days, so both the state and the regions meanwhile propose legal action against the deed deemed harmful, but very often a dialogue is established between the two, which leads them (rather, which often leads the region) to the amendment of the contested law, determining the end of the dispute.

As the following picture shows, the percentage of cases in which negotiations lead to the resolution of the dispute are very significant and, in fact, fill a vacuum, given that the Italian Constitution entrusts the resolution of conflicts of jurisdiction

only to the court, without providing any "political" venue for their resolution.

Also in the context of conflict avoidance, we can find a case of effective cooperative leadership, if we think that the "political" rather than jurisdictional management of the conflict favors a view of sharing the powers inspired by the agreement between levels of government, which benefits the implementation of public policies.

## Conclusion

This short analysis shows that the model of intergovernmental relations has common characteristics in the various legal orders in which they are practiced, which can be summarized in some fundamental points:

1. The IGRs are the consequence of the complexity of the current legal systems and of the large number and the great variety of tasks that they must exercise, for the implementation of which it is often not possible to divide the attributions between levels of government.
2. The IGRs are developed in parallel to the federal relations, which we could define as institutionalized, and are based on cooperative modules not previously identified and entrusted to the awareness of public officials.
3. The federal relations envisaged by the Constitution essentially concern the relationship between the federation and the member states or between the central state and the regions, while the IGRs also include the other levels of government (cities, provinces, and regions) and develop both horizontally and vertically.
4. IGRs are conducted according to informal models (Phillimore 2013).
5. IGRs arise from real administrative needs and generally receive only afterward a regulation.
6. The IGR method is functional to prevent and avoid conflicts, as the prior ex ante participation of other levels of government reduces ex post risks and, in any case, can lead to the spontaneous resolution of the disputes that have already arisen.

# Effectiveness of Local Government, The

Alexander Demin
South Ural State University, Chelyabinsk, Russia

## Synonyms

Effectiveness in the public sector; Efficiency of town or municipal government; Positive public perception to the overall local government structure and services

## Definition

The effectiveness of local government – the efficiency of service delivery performed by local authorities.

## Introduction

The modern economy exists in the environment where demands definitely exceed the resources needed for their satisfaction. In the public sector, the problem is complicated by the issue of budget expenditure allocation. Monitoring of indexes of effectiveness in the public sector facilitates solutions to the problems related to budget adoption and interbudget relations. Management science by effectiveness means the ratio of management performance expressed in the change in state of the object of management to the costs incurred to generate this change. The process of local public goods' production becomes the main object of management.

## The Essence of the "Effectiveness" Concept

Effectiveness is a relative indicator which is determined by dividing the effect amount on the cost of resources required for its achievement. The concepts of "effect" and "results" are not absolute synonyms. In most cases, the result of activities shall mean the amount of work performed and services provided, while the real indicator of the effect will be not the product but the change in state of the object of management. For example, the number of patients diagnosed with ASD (autism spectrum disorder), who were treated in a rehabilitation center, is the example of work of health institutions, and the percentage of discharged children, who managed to improve their adaptive behavior level according to the Vineland scale (Vineland Adaptive Behavior Scale), is the effect of activities of the institution.

## Initial Data for Effectiveness Evaluation

It is necessary to have data of several types to evaluate effectiveness of providing public goods:

1. The amount of resources allocated to implement the program or to finance individual tasks.
2. The output. The output is the amount of work completed, for example, kilometers of roads built or repaired or the number of outpatient visits.
3. The outcome. The outcomes are the strategic direction of improvements (citizens' life

quality improvement), for example, length of roads in a city with topping having retained their original properties over a year.

## Evaluation of Municipal Educational System Effectiveness

On a practical level, indexes of effectiveness included in the reporting of local government bodies in Russia do not allow to evaluate the quality of public goods. For example, the evaluation of the municipal educational system is carried out upon two indicators: the proportion of preschool children who are registered for the distribution to a kindergarten and the proportion of school graduates who have got marks higher than minimal threshold in the Unified State Exam (USE) in Russian language and mathematics, i.e., Russian language with 36 or more points out of a hundred, mathematics with 27 points. In the expanded list of monitoring indicators, such indicators are included as the proportion of educational institutions satisfying the modern requirements to education, budget expenditure per one pupil, and the proportion of children receiving additional education. It is obvious that these indicators do not allow to evaluate the effectiveness of educational services and record only the availability of educational system in a city and the amount of resources spent on the area.

Opportunities of educational environment form an essential factor of a city competitiveness: for attraction of ingenious specialists into the city, improvement of the educational services quality for their children can play a crucial part. Today there are independent private organizations which systematize information about quality of educational services by compiling the rankings of institutions. The Moscow Center for Continuous Mathematical Education (http://www.mccme.ru) annually generates lists of top 500 best schools of Russia and top 200 rural schools and the ranking of Russian municipal kindergartens; school rankings are formed on the USE results and success of participation in academic competition. Information provided by the Russian schools project (http://russianschools.ru) contains data not only on the results of the USE but also about the average salary of school employees, the proportion of teachers with higher education, and computer endowment; website data allow to assess the ratio of the amount of learning outcomes and school budget per one pupil. Data analysis performed shows that success of pupils in the exams is not connected with the amount of school budget and the average salary of teachers: there are schools with low exam grades and a high level of funding. The quality of educational services is such a complex concept that representative assessment can only be performed taking into account results of the survey of services receivers' satisfaction; such surveys are held but they are optional (https://docs.google.com/forms/d/e/1FAIpQLSe6DLGHgGR6y3unSZRcNE-9dLHrWwr_QwyDaMXFm4Ufl_C6Dg/viewform).

## Evaluation of Provision of Urban Amenity Effectiveness

A significant part of local public goods compound urban amenities, and evaluation of the effectiveness of these goods should be the obligatory element of monitoring of local government; however, in Russia this area is assessed by such indicators as the proportion of privately owned public utilities and the proportion of blocks of flats located on the land which was under the state cadastral registration. These indicators are of indirect relevance to evaluation of the effectiveness of housing and public services, while modern IT technologies allow to carry out such an assessment in the comfort of their home. By going on a virtual tour, you can evaluate different options of city life such as urban amenities, quality of public places maintenance, and the state of road topping as the main roads of a city and residential roads. However, there is still a significant number of factors which cannot show even the most detailed video cards: environmental characteristics of outdoor air, security of presence in the city, and qualitative indicators of social welfare institutions. Nowadays official reports of public bodies do not include indicators of state of outdoor air, although, as the factor of the place of residence competitiveness, ecology of an area often becomes

crucial. This omission is compensated by organizations which compile the environmental rankings of Russian regions; in particular, the all-Russian nongovernmental organization "green patrol" has been doing this type of work since 2008 (http://greenpatrol.ru/ru/stranica-dlya-obshchego-reytinga/ekologicheskiy-reyting-subektov-rf?tid=288). While compiling, the ranking publications of social networks and mass media are used; this example points to the importance of this indicator as the reputation in the formation of the city competitiveness, for example, Chelyabinsk region is widely known for its depressing situation with the environment, even more than for the meteoric impact. News opportunities related to the environment form the basis for a large part of publications about Chelyabinsk in social networks, as well as in the mass media. The activity of public interest groups, in particular, related to the petitions creation, is also used as a database for compilation of the environmental ranking of the "green patrol"; it is possible that this criterion has played a part to include Moscow region in the top ten most hostile regions of Russia. Thus, the competitiveness of places of residence is penetrated by marketing information technologies similar to those used in consumer goods promotion, but in this case, information cloud is often negative. Gathering information through a survey of residents on their satisfaction by urban amenities has a higher degree of representativeness than the media materials. Materials of http://www.domofond.ru website can be considered as the example of such a survey; the ranking includes 300 largest cities in Russia (http://www.domofond.ru/city-ratings?utm_source=newsletter&utm_medium=email&utm_content=city_ratings_user_emails_feature_link&utm_campaign=city_ratings_domofond_101016). This survey was conducted using identification of respondents via accounts on the most popular website of free advertisements.

## Municipal Economic Development Control

Despite the fact that the market and the public sector are formally separated in Russia, reports on the effectiveness of local government contain such an indicator as the number of small- and medium-sized business entities. This indicator correlates with the quality of work of local government bodies as the interaction with public sector institutions for an entrepreneur forms an essential part of the expenses for business organization and operation. More accurate description of the current business environment could be provided by the indicator showing, for example, the value of transaction costs of a new business creation. As the similar indicator, it is possible to offer time evaluation in days needed for paperwork to open a business; the number of negotiation contacts required for business creation will be a more complex indicator but deeply showing the situation. Global complexity of the assessment of this indicator is in specific character of the operation of nonformal institutions in Russia; first of all, even in an anonymous survey, businessmen will not disclose all the information, and secondly, to put the value of existing informal contacts into quantification is often impossible. In addition to this aspect of limited informative value of the quantitative indicator, there is a problem of lack of indicators of differentiation by types of municipal units; the situation with the development of business initiatives in towns and cities with a population of about a million people is very different, first of all, in motivation to expand economic and business activities. As a general rule, the outstanding personalities, who have entrepreneurial abilities and proactive attitude, tend to move to a big city at the stage of entering the university, and after graduation very few of them return to their hometown. In consequence of that, for small towns, the quantitative indicator of individual enterprises can to some extent characterize economic situation in a municipal unit partly with regard to the performance of local government bodies. However, for big cities, the indicator of a number of small and medium enterprises per 10,000 people is not informative, particularly with regard to evaluating the performance of local government bodies. To a greater extent this indicator characterizes work of the government body of antimonopoly control in the territory, since several enterprises of a large business can

be created in order to optimize taxation and even in some cases to gain control over the market. In addition to the number of small- and medium-sized businesses, the effectiveness of local government in economic development of a city is also evaluated by analyzing the proportion of employment in small and medium business, the investment volume in fixed assets, and the proportion of land plots which owners pay land-value tax. These indicators indirectly allow us to evaluate the economic development of the city, however, poorly informed about the performance of local government bodies.

## Effectiveness of Local Public Goods' Delivery

Delivery of local public goods such as local roads and transport connection in Russia is evaluated by calculating the following indicators: the proportion of roads which do not meet regulatory requirements and the proportion of the population who do not have regular transport connection with an administrative center of a municipality. Inclusion of indicators of absence of certain goods into monitoring instead of performance indicators corresponds to the Russian mentality; instead of road reconditioning, the budget is directed to the installation of the road sign "rough road."

The strategic objective of work of local government bodies is the improvement of the population quality of life; consequently, evaluation of these bodies' activities should show the extent of achievement of this objective. The monitoring of local government includes such indicators of life quality as residential accommodation area per capita, electricity and heat energy consumption per capita, consumption of hot and cold water, and natural gas per capita. The indicator of the average number of residential square meters per capita is quite specific from the perspective of evaluation not only of local government effectiveness but also of life quality in general; its similarity to the "mean temperature in a hospital" indicator is obvious. However, if we consider the dynamics of this indicator, some conclusions can be drawn. Variation of the indicator clearly has direct dependence on economic situation in the country as a whole, as well as in a particular municipal unit. The clearest dependence is shown by the additional indicator of housing in the city expressed as the number of square meters per capita brought into force in the reporting year. The pace of housing construction is a multiple parameter; among factors of general economic growth or recession in the country, the amount of real wages, rates on mortgage loans, and financial situation in the city-forming enterprises can be mentioned. The degree of local government bodies influence on this parameter is limited, within the competence of the administration is parcelling out of land for development purposes. Since 2005, according to the federal legislation, assignment of land for housing construction is carried out at auctions. Thus, local government bodies formally affect only the decision to conduct an auction for land, but the administration is not able to influence the selection of the auction winner. The activity of residential housing development of the city in addition to other factors is affected by the availability of informal institutional links between state and municipal government bodies and heads of developers. If the city is the capital of the subject of the Russian Federation, the most significant influence has a nonformal institution of interaction between the top official of the region and market-leading developers; local government bodies in such cities often play a subordinate role. The conductivity of the nonformal institution has an impact on the real estate per square meter price in this city and, consequently, the competitiveness of the city for its residents. Thus, the analysis of dynamics of the housing provision index allows to draw conclusions about competitiveness of the city; however, to assess the effectiveness of local government bodies upon this indicator is not possible.

The extended list of indicators of the local government bodies' effectiveness in Russia (Decree of the Government of the Russian Federation from December 17, 2012 № 1317) includes such an indicator as local budget expenditures for the allowance of employees of local government bodies per capita. The value of this indicator can be used to evaluate effectiveness only in any part

of the denominator of an indicator as it shows the resources spent, but absolutely does not show the results of employees' work.

## Satisfaction of the Population with Work of Local Government Bodies

Implementation of quantitative evaluation of management effectiveness has a number of difficulties, specifically: the results of work performed are often delayed, and direct executives of work are beyond the control of the structures of local government bodies, so the impact on the quality of services is indirect. For example, the Department of Education aims to improve teaching effectiveness; however, local government bodies do not have direct influence on employee motivation; local governments do not have. In Russia, the system is that a teacher should perform tasks which are divided between several specialists in the developed countries; in addition to implementation of educational activities, the teacher conducts correctional work with children with special needs such as attention deficit and hyperactivity disorder, the teacher monitors the payments of parents for children's meals and inform them in case of payment necessity, and the teacher conducts explanatory work with parents, urging them to make regular contributions to the economic needs of the institution. It is possible to identify such problems in the educational system only through a representative survey of services receivers. Since 2014 in accordance with the Decree of the President of Russia from May 7, 2012N 601 "about the main directions of improving public administration system," the index of satisfaction of the population with local government bodies in Russia is calculated. In fact, this is the only indicator from the list of indicators which is directly relevant to the evaluation of local government bodies' effectiveness. Data for the indicator is gathered through opinion polls, procedure of which is developed by state government bodies in regions, i.e., the method of data collection varies in regions, and polls are mainly conducted with the use of IT technologies.

Independence of such surveys and their representativeness cannot but cause doubts; for example, on the website with the survey of satisfaction of the population in Belgorod region http://ocenka.belregion.ru, one can get a report for a certain period of time broken down by municipal units and areas of evaluation; among the latter, there are such areas that have provision of urban amenities and housing and community amenities, road facilities, health care, culture, local government, education, public order and security, production and trade, labor, employment, tourism, physical culture, and sports.

The report data are surprising: most evaluates range within 90–100%, i.e., according to the survey, the residents of Belgorod region are extremely satisfied with performance of all areas of local government; moreover, some municipal units managed to obtain evaluates of the respondents, the number of which exceeds the population of the municipal unit; for example, in 2015 in Starooskolsky urban district, 312,791 answers of respondents were received, while the population numbered 257,948 people; a similar situation was in Gubkinsky urban district where the number of respondents interviewed exceeds the population by more than two times. The explanation of the situation is very simple because each Internet user can participate in the poll on Belgorod website, and there is no identification of the respondents.

Survey procedure development is in its formative stage in Russia. Currently the Decree of the Government of the Russian Federation from December 17, 2012N 1317 states that the criteria for satisfaction of the population with activities of heads of local government bodies' evaluation are based on satisfaction of the population under the following three sections: organization of transport services, the quality of roads, and the quality of housing and utility services, in particular, heat, water, electricity, and gas supply. It remains unclear why such areas of municipal activities such as education, health, and culture were not included in the evaluation criteria. Some municipal unities extend the list of criteria on their own initiative and conduct surveys on self-developed questionnaire; lack of respondent's identification

system reduces the representativeness of survey results; however, the presence of these questionnaires on a website of a municipal unit indicates an increase in information transparency of government authorities in Russia.

For a substantial part of the population, the straight question – are you satisfied with the activities of the local government bodies? – is much more complicated than a question in comparative form, for example, has the situation with city management improved or worsened due to shift of the head of the city, in case of the elective head? the answer to this question could be reelection of the head for a new term; however, today direct elections of the head of the city are abolished in many municipal units of Russia. Rugion company has launched a questionnaire on the most popular website in Chelyabinsk "Chelyabinsk in 12 chapters: who is better?" (http://chelyabinsk.ru/text/280_years/20657161 9725312.html). In addition to an opportunity to vote, the questionnaire offers to see pictures of city managers, their background, and their merits to the city. Representativeness of this survey is higher than the direct polling on satisfaction with activities of local government bodies as it allows to evaluate the work result of the head of the city after a long period of time.

In addition to the complexity of perception of the question about satisfaction with local government, there is a problem of public awareness of the area of accountability of local government bodies; most people tend to blame any level of government in their personal problems like their wages or prices of food and gasoline.

## Conclusion

In order to evaluate the effectiveness of local government, it is necessary to determine the key development direction of the city such as competitiveness enhancement of the city for its residents and investors. Direct evaluation of the competitiveness of cities is possible by compiling rankings based on population surveys and objective data of official statistics.

# Efficiency of New Zealand District Health Boards

Antony Andrews
School of Economics, Auckland University of Technology, Auckland, New Zealand

## Synonyms

District Health Boards; Healthcare efficiency; New Zealand public health; Public funds; Technical efficiency

## Definition

*Technical efficiency* refers to the performance of each healthcare provider relative to the efficient production frontier. The frontier is based on "best-observed practices," where inefficient healthcare providers are found to be operating below the efficiency frontier. *Technical efficiency* in this entry computes the measure of how far below healthcare providers are operating from the efficient production frontier for a given level of inputs.

## Introduction

In the past 50 years, New Zealand has experienced a considerable increase in public healthcare expenditure. The real cost spent by New Zealand government has risen from $583 in 1950 to $2987 per capita in 2011 (2011 New Zealand dollars), which, as a share of GDP equates to an increase from 3.1% in 1950 to 6.9% in 2011 (The Treasury 2013). The same Treasury report also projects healthcare expenditure as a share of GDP to rise to 12% by 2060. The persistent increase in the public healthcare expenditure presents an unavoidable challenge to the New Zealand government, who must now look into ways to manage healthcare resources more efficiently.

A crucial part of the New Zealand public healthcare system is 20 District Health Boards (DHBs) that are entrusted with a substantial

portion of the public healthcare budget to provide hospital services in their regions. In the year 2017/2018, approximately 75.6% of the total public healthcare budget of 12.7 billion was distributed to DHBs to meet the regional healthcare demand, including hospital services (The Treasury 2017). However, public healthcare audit reports show that DHBs have failed to manage public funds efficiently and have posted consistent deficits over the past few years (Controller and Auditor-General 2018).

This entry aims to contribute to the New Zealand healthcare literature by providing a conceptual measure of DHBs efficiency and link to the factors that may explain variability in levels of technical efficiency.

## New Zealand District Health Boards

The New Zealand Public Health and Disability Act 2000 gave DHBs the sole responsibility of managing resources to provide for the health and disability needs of communities in their regions. Under the act, DHBs own public hospitals as their provider arms and are solely responsible for providing public hospital services. A population-based funding formula (PBFF) is used to determine the amount of funding DHBs receive every year. The PBFF aims to allocate resources between DHBs according to the relative needs of their populations. Therefore, DHBs form the nucleus of the current public health system in New Zealand in providing hospital services to the public. Currently, there are 20 DHBs in New Zealand that vary considerably in size, with Waitemata DHB being the largest serving about 560,000 people and West Coast DHB being the smallest with about 31,000 under its jurisdiction. Table 1 displays the list of 20 DHBs along with their various characteristics.

**Efficiency of New Zealand District Health Boards, Table 1** New Zealand DHBs

| DHB | Population deprivation level | Population |
|---|---|---|
| Auckland | Low | 460,000 |
| Bay of Plenty | High | 220,000 |
| Canterbury | Low | 501,425 |
| Capital and Coast | Low | 300,000 |
| Counties Manukau | High | 512,130 |
| Hawke's Bay | High | 165,000 |
| Hutt Valley | High | 140,000 |
| Lakes | High | 108,000 |
| Mid Central | High | 160,000 |
| Nelson Marlborough | Low | 134,500 |
| Northland | High | 175,000 |
| South Canterbury | Low | 55,000 |
| Southern | Low | 315,000 |
| Tairawhiti | High | 46,000 |
| Taranaki | High | 110,000 |
| Waikato | High | 360,000 |
| Wairarapa | High | 40,000 |
| Waitemata | Low | 560,000 |
| West Coast | High | 31,000 |
| Whanganui | High | 60,120 |

## Data Envelopment Analysis and Beta Regression

DEA is a non-parametric technique based on a linear programming tool developed by Charnes et al. (1978). A DEA model for $n$ decision-making units (DMUs) with each using $i$ inputs to produce $j$ outputs, the output-oriented technical efficiency of $DMU\ r_0$ can be evaluated by solving the following linear program:

$$\widehat{\theta}_{r_0} = \max \ \lambda \tag{1}$$

subject to:

$$\sum_r X_{ir}\gamma_r - X_{ir_0} \leq 0 \quad i = 1, \ldots, I$$

$$\sum_r Y_{jr}\gamma_r - \lambda Y_{jr_0} \geq 0 \quad i = 1, \ldots, J.$$

$$\gamma_r \geq 0, \ r = 1, \ldots, R$$

where $Y_{jr}$ is the amount of the $j$th output observed for the $r$th DMU, $X_{ir}$ is the amount of the $i$th input consumed by $r$th DMU, and $\lambda$ is a scalar value that seeks to expand all outputs proportionally given the input quantities.

This entry also uses beta regression to model a dependent variable ($y$) that is measured continually on the standard unit interval, i.e., $0 < y < 1$. The beta regression allows dependent variables that fail the normality assumption to be modelled with a very flexible alternative. The beta regression assumes the dependent variable is beta distributed denoted by $\mathcal{B}(\mu, \phi)$ that take varying shapes depending on the values of $\mu$ and $\phi$ and can easily incorporate asymmetry.

## Data Description and Descriptive Statistics

The efficiency analysis of healthcare units requires the selection of appropriate outputs and inputs to derive the efficiency frontier using DEA. This entry uses case-weighted inpatient discharges and price-weighted outpatient visits as outputs. In New Zealand, each inpatient visit is first assigned into an AR-DRG (Australian Refined Diagnostic Related Groups) based on clinical condition and then weighed according to Weighted Inlier Equivalent Separation (WIES) weight to derive case-weighted inpatient discharges. On the other hand, outpatient visits are price-weighted by multiplying outpatient volumes by the price of respective purchase units and then dividing by national case-weight price. The weighted outputs offer a consistent way of accounting different healthcare outputs for their relative complexity and resource consumption.

With respect to inputs, this entry uses Full-Time Equivalent (FTE) counts of medical, nursing, allied, support and management staff of each DHB as a measure of labor consumption. To increase the discriminatory power of DEA, the FTE counts of nursing, allied, support, and management are combined to form a new weighted measure -*Non-med staff,* based on their proportion of total labor expenditure. However, it is worth noting that many clinicians in larger DHBs also offer contractual services to neighboring smaller DHBs, which may not be adequately reflected in FTE calculations. Second, for capital inputs, the end-of-quarter capital asset values of hospital buildings, clinical and non-clinical equipment, information technology and motor vehicles reported by DHBs are used as a proxy for capital input.

The MoH, under the Official Information Act 1982, has provided quarterly balanced panel hospital data from month ending September 2010 to June 2018 for all 20 New Zealand DHBs. In Appendix A1, the variables and their definitions are provided, while Table 2 presents basic descriptive statistics by year.

E

**Efficiency of New Zealand District Health Boards, Table 2** Descriptive statistics

| Variables | Statistics | Values |
|---|---|---|
| Medical staff | Mean | 1,264 |
| | Std. Dev. | 1,219 |
| | Min | 97 |
| | Max | 5,230 |
| Non-Med staff | Mean | 7,795 |
| | Std. Dev | 6,110 |
| | Min | 1,078 |
| | Max | 24,068 |

## Results

A distinct feature of this entry is the availability of the panel data on DHBs. This gives an opportunity to take into consideration the dynamic structure of data, which, if ignored, penalizes DHBs that consume relatively high resources that are intended to produce future benefits. Therefore, this entry intends uses an intertemporal approach where a single production frontier which spans the whole period is defined. This approach adopts the idea that there is no significant change in technology over the entire period under analysis, i.e., the production frontier is fixed. In this framework, a multi-period comparison can be carried out as in each particular period, one DHB's performance is compared to its own performance in other periods and with other DHBs (Cullinane et al. 2004). This virtue of intertemporal analysis enables to evaluate efficiency scores that include a DHB's ability to make efficient use of available technology, in particular for DHBs that are characterized by low investment in capital and technology, whether or not increase in the capital per labor raises their overall efficiency levels.

The results show that the performance of New Zealand DHBs has not changed from 2011 to 2018 and in fact, the technical efficiency dropped from 0.89 in 2011 and to 0.87 in 2015. The overall grand average technical efficiency is 0.89, which indicates, that, on average, New Zealand DHBs have not made any improvements since 2011 and could have increased their hospital services by approx. 12% if they have not only followed the sector's best practice but had also kept abreast of technological innovations in the New Zealand healthcare industry.

The weakest performers that experienced decreasing efficiency performances from 2011 to 2018 are Northland (−12%), Mid Central (−4%), Nelson Marlborough (−17%), Hawke's Bay (−7%), Taranaki (−10%), and Whanganui (−3%). It is noticeable that all these DHBs except Nelson Marlborough operate in areas with high deprivation. This indicates that DHBs operating in the area of high deprivation suffer from deteriorating efficiency performance.

However, bucking the deteriorating trend is West Coast, which showed a commendable improvement of 32% from the efficiency score of 0.69 in 2011 to 0.92 in 2018. The top performers with stable trends in the sample are Auckland and lakes, both showing an overall average efficiency rating of 0.95 and 0.94, respectively, followed by Counties Manukau, Bay of Plenty, Canterbury, Waikato, all posting a score of 0.93. Other top performers include Southern, Capital & Coast, Hutt Valley, Wairarapa, South Canterbury, and Waitemata posting average efficiency rating between 0.89 and 0.92.

The results of the beta regression model are displayed in the form of average marginal effects in Table 3. The marginal effects in Table 3 show the impact of patient structure and other related factors on technical efficiency levels when

controlled for level of deprivation, seasonality, and year-specific effects. In the results, a negative sign is associated with decreasing effect on technical efficiency, whereas positive implies an increasing impact on technical efficiency levels. The 1% statistically significant positive sign of the marginal effects for DHB operating in highly deprivation area suggest that these DHBs experience better levels of technical efficiency. This appears to be contradictory to the results found in the previous sector, where these DHBs posted some of the lowest and deteriorating level of efficiency. This is expected as DHBs in highly deprived areas often experience a high number of patients in their public hospitals due to a large section of the population's inability to afford access to primary health care providers who as an alternative choose public hospitals (Cann 2016; Edmunds 2016). As a result, DHBs operating in highly deprived areas experience a relatively high demand for hospital services leading to higher service to resource ratio than DHBs in areas of low deprivation.

Nonetheless, this positive effect on DHBs that have highly deprived population reduces and become negative with an increasing proportion of Māori and Pacific inpatient discharges at a

statistically significant level of 1%. This negative effect of Māori and Pacific inpatient can be explained by the high resource consumption associated with the Māori and Pacific population living in highly deprived areas, who are generally less healthy, and experience high levels of poor health outcomes compared to other ethnicities.

Similarly, in isolation, the marginal effect shows that DHBs with a higher proportion of surgical inpatients experience higher levels of efficiency. However, when controlled for DHB deprivation, this effect reverses and become negative. This suggests that significant mismanagement of resources exist with the scheduling, and allocation of staff and equipment for surgeries. Inefficient management of surgical units has resulted in a high rate of surgery cancellations and long waiting lists for patients waiting for elective surgeries in New Zealand. Likewise, the result shows the existence of the negative effect of a higher proportion of acute inpatients that operate in a highly deprived area, but this effect is found to be insignificant. The effect of the average length of stay in hospitals, as expected, high length of stay impacts technical efficiency negatively and therefore reducing them can assist in improving technical efficiency to some extent. This effect holds true whether a DHB operates in a highly deprived area or not.

In isolation, the effect shows that increasing capital per labor decreases efficiency level, but for DHBs operating in the area of high deprivation experience a higher level of efficiency with raising capital investment. Capacity constraints relative to demand lead to low asset utilization leading to inefficient use of hospital space, whereas ageing information technology leads to substantial duplication of administration practices. A report by Auditor General pointed towards deferred maintenance, underinvestment in buildings and capital equipment as a major hurdle for the majority of DHBs in reducing cost and maximizing efficiency (Controller and Auditor-General 2016).

## Conclusions

The findings of this entry can be presented as follows:

(i) The average technical efficiency levels of New Zealand DHBs in providing hospital services over the period 2011–2018 stands at 0.89.
(ii) The average yearly levels of technical efficiency among the DHBs show that no improvement in technical efficiency levels has occurred between 2011 and 2018; instead, efficiency dropped from 2011 to 2015.
(iii) There is also some evidence that DHBs providing hospital services to the population with low socioeconomic status are associated with low levels of efficiencies as the bottom six DHBs operate in the area of high deprivation.
(iv) The DHBs operating in highly deprived areas with a higher proportion of Māori and Pacific inpatients, surgical or acute discharges experience a decreasing level of technical efficiency compared to DHBs that operate in the area of low deprivation.

## Introduction

The coming of e-governance transformed the way one would look at the ethics of leadership. The new technology was ready to take over most of the routine jobs of an executive, who would thereafter need more learning and knowledge to coordinate the emerging new networks of agencies, signing contracts for collaborations, partnerships, and outsourcing services. The administrative offices would now be occupied with non-government consultants, firms, and service providers and every transaction would demand from administrators much more transparency, accountability, efficiency, and speed. The new priorities of ethical leadership which substitute the conventional principles of Weber's hierarchy, written rules, impersonality, and neutrality are transparency, accountability, efficiency, speed, and rule of law. Since the new technology is capital intensive and it also deals with online transactions, investments, and cash transfers from banks, government agencies, and finance companies, regulators would coexist with the administrator, and this relationship would also be a new challenge to ethical leadership. How did this change arrive and what would be the new priority areas for the ethics of leadership is the concern of this paper.

## Imperatives of e-Governance on the Ethics of New Leadership

e-governance is imperative to public administration today. Most services are online and most offices which were earlier spread around the whole city are now working from small cells and call centers. Banks have reduced their physical presence and tax collection windows are now rarely visible. The administrators are getting the pulse of their policies through WhatsApp, Twitter, and other social media groups, and most services have become self-steering in a manner that the time and cost of service delivery has relatively much reduced as compared to the past. The conventional framework of ethics in Weber's bureaucratic theory reflected a protestant ethic of an advancing capitalist state but the new technology transforms ethics to a new direction. The online portals of administrative departments deliver many services such as registration for admission; interviews and shortlisting for educational and professional institutions; online result declaration and management of selection and training processes; conducting examinations; registration for services; procurements, tendering, and transactions of payments for utility services; money transfer; e-passports and visa; online commerce; online deposit and submission of tax returns; e-banking; citizen verification and identity cards; e-complaint; e-FIR at police stations. This overload of online responsibilities is intimidating and also vulnerable. To manage such a challenge would need an integrated and synergistic e-technology which is linked to many other devices and is also fully secure.

Studies on a critical and comparative impact of this new change have been rare, marginalized, (Suggested reading is Wescott (2001). And subsequent unpublished papers on the same theme for the Asian Development Bank 2010 and NAPSIPAG 2012, Reddick (2010), Singh (2013) and Tolbert and Mossberger (2006), Rahman (2016).) and mostly confined to e-government leadership. The technology grew without leadership in its initial years. In the Asian region, developments towards e-governance started in the decade of 1970s when National Information Centres were established in most of the countries. Gradually in the next decade most countries including India launched a satellite-based computer network (NICNET in India 1987). The satellite connectivity was quick to set up ambitious district level information centers, computerization of all offices which soon after got tele and internet

connectivity to launch e-governance initiatives at various levels of government (Fig. 1).

Ethical leadership in present times indicates "*five key dimensions*"

- **Controlling Corruption**: e-governance is the strongest strategy to prevent corruption as established in the Global Corruption Report survey in 2003. (p. 11, "E-government offers a partial solution to the multifaceted problem of corruption. It reduces discretion, thereby curbing some opportunities for arbitrary action. It increases chances of exposure by maintaining detailed data on transactions, making it possible to track and link the corrupt with their wrongful acts. By making rules simpler and more transparent, e-government emboldens citizens and businesses to question unreasonable procedures and their arbitrary application.") Many authors (Carr and Jago 2014; Iqbal and Seo 2008; Charoensukmongkol and Moqbel 2012; Sturges 2004) have established empirically by comparing the corruption and e-government indexes that the advance of e-governance has reduced corruption and arbitrary discretions of bureaucracy in many regions. To achieve Sustainable Development Goals for ending poverty by 2030 and achieve the targets set for Financing for Development it is incumbent upon leaders to stop the flow of USD 1.5 trillion in bribes every year (World Bank 2017) which hijacks opportunities from the lives of the poor. To prevent this pathetic situation, innovations such as e-office, in-house training to personnel at every level of the hierarchy, on-desk support mechanism, regular meetings with staff to motivate them and also provide incentives to help them adopt e-governance would add up to the responsibilities of a leader. The World Bank (2017) sets a requirement for leadership in creating international transparency standards (Global Initiative on Financial Transparency, Open Contracting Standard, Asset Disclosure Standards) and support for implementing open government.
- **Removes Regional Disparities**: By deepening internet penetration to the farthest corner of the country most regional disparities start fading (see Kim et al. 2005). This refers to achieving "access," "affordability," and "speed" in a "last mile delivery." It also indicated that government programs should adopt complete

**E-Governance and Ethical Leadership, Fig. 1** Essentials of ethical leadership and e-governance. (Source: Author)

e-technology rather than in segments as it is counterproductive to the objectives of e-governance.

- **e-Governance Bridges the "digital divide"** among communities, regions, and nations and focuses upon technology systems which respective requirements of gender, disability, caste, class, religion, race, language, or geography. A report (This information is taken from "Digital in 2017" report compiled by Hootsuite, social media management platform, and We Are Social, a social media agency. See link http://www.hindustantimes.com/opinion/locating-gender-in-the-digital-divide/story-zt10VjNAwnOqcChjkYCLfN.html. Accessed on 23.8.2017.) demonstrates that India's internet penetration rate is only 35% in comparison to 50% of global internet penetration rate. Of the total Indian Facebook users of 191 million, only 24% are women. Economic and cultural norms dominate perceptions on the use of internet by women. Andreea Stoiciu (2011) highlighted in the UN Chronicle that there is need to increase the level and depth of all stakeholders' participation in decision making and in implementing e-governance to bridge the great gap between knowledge-based and rudimentary societies which continues to be one biggest impediment towards bridging the digital divide.
- **Facilitates Learning of Processes**: Inculcation of knowledge prevents techno-centrism or techno-determinism which give rise to monocultures in the pedagogies of development. This development is likely to bypass alternate designs which sustain civilizations and histories. This learning helps administrators to scientifically approach and improve indices of e-governance which move towards holistic and inclusive development through scientifically established targets (see Singh 2013). The most commonly followed indices are those from the United Nations such as Human Development Index (HDI) such as the e-Governance Index (EGI), e-Readiness Index (ERI), Networked Readiness Index (NRI), and Web Measure Index (WMI). By setting indices the problem of biases which is so common in qualitative assessments is addressed to logically. This helps benchmarking of results and practices relatively more authentic for research.
- **Ensures Data Security**: Government and people expect their data to remain secure if they were to use e-services, and these are; cash, medical records, bank accounts, agreements, official communication, emails, decisions, citizens' identity information, intellectual property, etc. Hacking of the most protected government websites has taken place and data stolen and misused. (On 26th June 2017 some websites of the US Government were hacked by the pro-Islamic group. On 13th February, India's most protected website of the Home Ministry was hacked and in 2016 also several such cases including the websites of Indian Missions abroad were hacked.) The ATM, debit and credit cards are protected through a password yet those who have lost cash are still growing. This has also thwarted many states from being proactive on uploading information on e-governance portals especially payments to the retired personnel such as e-pensions which had to be tested in many security trials before opening to people. A large number of software ensure safety of our bank accounts, property information, family data, creative and intellectual data.

A very interesting argument made by Singh (2013, p. 6) highlights an intriguing predicament for a practitioner "whether the precedence of 'e' in governance makes any substantive change in the nature of governance or it's the nature of governance itself which defines the applications of 'e' in governance." This line of thought has a key role to play in an emerging design for ethical leadership which is likely to face many dominating strands of politics and business companies. A liberal state governed by new institutional economics would get iconic market-friendly leaders as e-governance technology advances with the willing support of varieties of modern world messiahs like the media baron Keith Rupert Murdoch, (He is an American Australian business tycoon who shot into popularity due to his rapid strides in controlling the digital media and expanding it into

a monopoly business through "News Corporation" owning over 800 companies in more than 50 countries with a net worth of over $5 billion.) world visionary saints like the late Steven P. Jobs, (The iconic co-founder of the Fortune 500 Apple Company which not only ushered in an era of personal computers and touch screens but also a cultural transformation of all entertainment business in music, movies, IPhones and social networking sites on digital media. He recently died on 5th October 2011.) and strategic genies such as Bill Gates, (The American software genius and business leader in computers, founder of Microsoft Company which is constantly innovating with software for personal computers and for long remained uncontested in the market.) Bob Young, and Marc Ewing (Bob Young and Mark Ewing are two founders of the Open Software movement called the Red Hat movement in 1993, which since then has broken the Microsoft's expensive monopoly of software. Red Hat has decontrolled ownership of these software for the benefit of smaller businesses, firms, and public sector applications. Red Hat Movement can be referred to as a digital grassroots movement serving the interests of the underprivileged in electronic industry.) (Singh 2013, pp. 5–6).

## Ethical Leadership: The Great Transformation

This chapter attempts to find out if ethical leadership has undergone a transformation with the coming of e-governance. It is accepted that the concept of leadership entails many difficult ethical questions which lie beneath the processes of organizational management and the leader's drive towards the achievement of common good rather than personal interests. Ethical leaders are provided much visibility through e-governance through which the structures and the processes of authority, compliance, and supervision standards are maintained with responsibility, transparency, and accountability. e-governance ensures a stamp of ethical forbearance and maturity to the decision-making processes. It is also transforming the traditional ethical leadership of compliance to moral codes of hard work, right behavior, and observance to norms of spiritualized ethics to a new knowledge-based wired mechanism which ensures collective moral responsibility to an impersonal and detached self-steering mechanical system. Different authors have shared a variety of perceptions on traits of an ethical leader of today. While John W. Gardner (1990) could agree on "wisdom" as a key trait for a leader, Zhang (2013) suggested that leader should be able to create an open environment in which one could express and criticize or could even be a whistleblower. For the purpose of clarifying the connection of ethical leadership to e-governance, Starratt (2004) explains it as a commitment based on three essential virtues, i.e., proactive *responsibility*; personal and professional *authenticity*; and an affirming, critical, and enabling *presence* to the workers and the work involved in teaching and learning. Notwithstanding an attached warning to ethical leadership alongside the above discussion on its traits is about its ability to understand the limitations of what this leadership can achieve as followers may not always follow everything that the leader would expect from them (p. 145). e-governance has speed which many users may not have the capacity to match with.

The transformation is phenomenal but there is a common agreement to three fundamental requirements in ethical leadership as given below in Fig. 2. The subsequent section of this chapter would explain how ethical leadership gets supported through e-governance in undertaking proactive responsibility, remaining present for his supporters and followers, and also making his authenticity visible to the organization.

## Traditional Versus Modern Concepts of Ethical Leadership

e-governance has transformed the concepts of ethical leadership by transforming the manner in which government works. It is not simply a breakdown of bureaucratic boundaries but also a leveling down of the traditional concept of hierarchy. The most substantive change comes in the dimensions of trust, legitimacy, and patterns of morality

**E-Governance and Ethical Leadership, Fig. 2** Substantive role of ethical leadership

due to which citizens participate in the processes of governance. This could be understood only when one is familiar with what form of ethical leadership has traditionally preexisted this change.

Traditional concepts of ethical leadership have emerged from the first recorded histories of kingdoms as relationships between the rulers and the ruled rather than from the origin of mankind as biological records of "homo sapiens." The earliest records dating back to the Indian manuscripts of *Yajurveda* 1500–3000 BC (Chendrayan 2009) and Kautilya's *Arthashastra* (see Kazanas 2010, where the 3000 BCE produced Indian manuscripts of *Ramayana* and *Mahabharata* have been acknowledged as the most ancient world texts for governance and ethical leadership.) of 321 BC, Chinese manuscripts of Taoist philosopher Sun Tzu's *The Art of War* (Bryman et al. 2011) (600–421 BC) have described relationship of the rulers and the ruled in civil and military organizations, tactical dispositions of a leader, and statecraft. Interestingly, ethics (There could be no better holistic description of ethics as given by Kautilya, "The root of happiness is *Dharma* (ethics and righteousness), the root of *Dharma* is *Artha* (economy, polity), the root of *Artha* is right governance, the root of right governance is victorious inner-restraint, the root of victorious inner-restraint is humility, the root of humility is serving the aged" (Kautilya's Book *Chanakya Sutra* 1–6) quoted in Rajput (2012).) occupies the core of every activity of the king, i.e., law making, administration, and citizen services. Ethical leadership safeguards the delivery of services from cradle to grave and common good becomes the key of governance. (Kautilya's Arthashastra Book two, *Duties of Government Superintendents*.) It justifies its existence by providing the right environment and freedom for citizens to advance. This perception dominated administrative theory during the postcolonial narratives of developmental administration and continued till the radical current of public choice and new institutional economics exposed the intentions of the state which provided and obtained ethical leadership (Buchanan and Tullock 1962; Olsen 1965; Meador and Skerratt 2017). The former concept of a leader with characteristics of being humane, interactive, and participative undergoes transformation with the coming of e-governance. The new era leaders could be skilled in technology and may manufacture their leadership through the use of e-campaigns and publicity over the net and social media which have a global reach at the click of a button. The new scenario suggests that even an invisible and absentee leader can be seen to provide ethical leadership. This is clearly reflecting

the nature of the new techno-deterministic state as Singh (2015) suggests that the state has become neocorporatist and acts more in self-interest rather than as Weber's rational-legal entity. At this juncture when the world seems changing its ethical discourse and the greatest epitome of ethical leadership "the state" itself came under the sharpest attack, traditional trust in the leader also broke down (see Chakrabarty's 2016). The deepening impact of new institutionalism over state institutions was exacerbated with the coming of the faceless system of government called e-governance which was large enough to hide a snoring administrator. The deadlines for achieving targets set by the Millennium Development Goals (MDG) required both online and onground tracking for evaluating progress on implementation, of administrative capacities, and about community resilience building. These few years preceding the MDG deadline of 2015 could highlight the fact that sustainable ethical leadership is predominantly a ground-based leadership which is sensitive and proactive to people's problems rather than a mere skilled-based cyber world campaigner, which could have elevated some to leadership status by default.

## Ethical Leadership Is About Strengthening Equitable Development with Efficiency and Speed

The fourth report "Ethics in Governance" of the Second Administrative Reforms Commission in India (2007) had emphasized that the tools of modern technology such as Information and Communication Technology (ICT) should be used to transform the relationship of government with its constituents, citizens, businesses, and also its own agencies. This form of governance is called SMART (Simple, Moral, Accountable, Responsive, and Transparent) governance. (Paragraph 83, Report of the Working Group on Convergence and E-Governance for the Tenth Five Year Plan (2002–2007), Planning Commission November, 2001.) The year 2005 brought out some scholarly work in understanding leadership in relation to the trials of governments before the new technology. The overlapping domains of technology, ethics, integrity, and leadership challenges of 2005 found a place in some US-based publications by George Fredrickson and Richard K. Ghere's *Ethics in Public Management* and Carol W. Lewis and Stuart C. Gilman's *The Ethics Challenge in Public Service*. A few years later in 2008 an edited volume *Ethics and Integrity of Governance: Perspectives Across Frontiers* brought together the whole ongoing discourse on the subject.

The new environment of e-governance during its starting years seemed more like a confused chicken and egg controversy (The scores of access to the ordinary masses have been so low that despite huge investments ranging from almost INR 40,000 crore in India (NeGP budget), TK 2.81b and TK 10.97b. spent in Bangladesh (BanglaGovnet), and PKR 2.6 b. (ITS Notification, 19.10.2002) already exhausted in Pakistan (TRE survey) for the development of ICT infrastructure and procurement proposals, the percentage population outreach efforts have not shown any significant change (Singh 2013, p. 9).) and was ready to become a recipe for disaster. The policies of e-governance did not and could not be brought in a single package like other policies and above that, the internal and external networking of the department further aggravated unresolved challenges for an erstwhile steel frame bureaucracy. Therefore, e-governance recasts bureaucracy (West 2005) and can redistribute power and functional responsibilities across all agencies with the critical intention not to accept status quo and to promote emancipation (Hirschheim and Klein 1994). It triggers many questions on the kind of "leadership ethics" needed for changing times (Van Wart 2013). This change finds it important to bring together critical management studies, critical information systems, and critical theory approach to technology (Stahl et al. 2014). This transforming ethical leadership would no more be localized, communitarian, or confined to specific geographical regions but is expected to spread wider and deeper in a manner known only to the state and the big multinational service providers (see Singh 2013). These new e-governance systems running state administration would need leadership which is highly

knowledgeable, exposed to global politics, ICT Control systems, internet governance, and the specialist groups within the ecosystem of ICT. The new ethical leadership in e-governance is a legal person governed by Information and Technology laws which nevertheless greatly influence the regular constitutional laws and requirements of civil and criminal Penal Codes.

The e-governance era has proven record that an efficient, sensitive and hardworking leadership owns the largest number of best practices. This section would highlight the facts from some case studies in India. In 2005 the Department of Administrative Reforms and Public Grievances (DARPG) in India embarked upon an evaluation process of its identified best practices in e-governance. More than 200 practices were evaluated with the funding made available by DFID and the World Bank to India. Interestingly, evaluation highlighted the need for ethical leadership as an indispensable tool for success in performance. Two states, i.e., Gujarat and Andhra Pradesh, provided a committed leadership for their initiatives in e-governance through their chief ministers Narendra Modi and Chandra Babu Naidu, respectively. **The success of their leadership is attributed to the following reasons**:

1. **Indigenization**: Time-based, home grown skill development program. This was home grown through the use of local language, local relevance, and local markets. It was also locally managed as the government had hired retired personnel from the same office. The state encouraged their own sons of the soil from foreign countries and absorbed them in a mission-driven assignment for the benefit of their countrymen. The software and programs were simplified so that people do not feel obstructions in accessing services. As electricity load shedding was common, the state governments were held accountable for undeclared and arbitrary load shedding which affected the delivery of services. Training was imparted in several areas, i.e., uploading information, increasing access, simplifying administrative file jargon, signing partnership contracts, and diffusion of technology. Some of the richest states like Haryana and Punjab in India demonstrated the worst records in ethical leadership in e-governance, while some of the poorest regions of the country like Bundelkhand in the state of Madhya Pradesh and Goghumba in the state of Gujarat had greater success stories due to the availability of ethical leadership. (Governance Knowledge Centre created by the Department of Administrative Reforms and Public Grievances, at the Centre for the Study of Law and Governance, evaluated more than 200 e-governance practices across the country which were subsequently submitted to the government in 2009.These practices from Gogumbha and Bundelkhand (TARA-Haat) are published in Singh's *Enlarging Entrepreneurial Networks of Local Citizens in backward Regions of India*, 2005.)
2. **Proactive Bureaucracy**: Bureaucracy made accountable to people through IVRS, SWAN, and Video Conferencing systems. Regulating the regulator and generating legislative responsibility for implementation was difficult, yet decentralized pathways due to the presence of answerable bureaucracy were not porous enough to create islands of corruption. The middle men disappeared and local people made the citizens' service centers functional. The meticulously prepared 15 Reports of the Second Administrative Reforms Commission in India completed between 2007 and 2010 have yet to be opened up, read, and implemented by the executive bodies. The 4th report is exclusively on Ethics and Integrity.
3. **Interactive Websites**: Reworking government websites to disseminate and deliver information. The Web Measurement Index suggests the nature of a particular government department as it rates the degree of openness being practiced by it. They were prepared in a manner that substantive information would be difficult access, downloading impossible, or search engine to an accountable administrator would be fuzzy. The websites should have quick access, relevant information, transparency about the department officials, simple contact processes, budgetary information, regular updating, and fast downloading.

Therefore ethical leadership becomes a quid pro quo of e-governance. Given below is a simple figure to show why one e-governance practice which progressed incrementally in relationship to citizens' needs could be successful but the other which implanted arbitrary e-systems could not.

Figure 3a, b bring out the facts that to enable ethical leadership in e-governance, a complete e-system application and integration has to be completed through computer-mediated communication with mobile telephony. The mobile telephony is also an integrated service mechanism which connects to land-based cellular networks as well as to satellites. Both networks are connected to the public switched telephone network (PSTN) which allows connectivity to any phone in the world.

## Does e-Governance Help in Installing Ethical Leadership?

Ethical leadership as believed by the critical theorists removes hurdles to the progress of workers in an organization. Ideology is one such hurdle which critical theorists dismiss as skewed perceptions of reality which disadvantage some and advantage others (Freeden 2003; Hawkes 2003; McLellan 1995). e-governance may also be driven by a particular ideology (Gramsci 1971). It also relates to the rise of new technologies which have a hegemonic purpose often leading to reification which renders a potentially contested social agreement as a natural fact. It further leads to commodification which fails to question the purposive rationality and generates perpetuation of ideologies.

Conventional public administration suggests that individual perspectives on power, authority, and leadership may influence the ethics of leadership in an organization. However, the coming of e-governance has largely diluted and depersonalized issues in a way that they can now be dealt with more rationally and participatively (Likert 1961). The humanists in organizational theory such as Chris Argyris, Rensis Likert, and F. J. Roethlisberger have emphasized the development of human potential rather than just routine performance of jobs. Computer-mediated communication (CMC) coupled with various software, apps, and web applications has reduced or deepened routine management workload by transferring them to self-regulatory automated systems and made more valuable time available to an administrator (Derks and Bakker 2010). These e-governance systems inadvertently contribute to ethical leadership in another valuable way. They assist in tracking performance and by doing that they are able to solve a long-standing bureaucratic puzzle of why rabbits loose and tortoise wins. Robert Jackall (1983) comments through an interpretative sociological analysis in an organization which is not tracking the work of its employees, "What if, however, men and women in the big corporation no longer see success as necessarily connected to hard work? What becomes of the social morality of the corporation—I mean the everyday rules in use that people play by—when there is thought to be no 'objective' standard of excellence to explain how and why winners are separated from also-rans, how and why some people succeed and others fail?" Such ethical problems have always consumed work ethics within an organization and over the period has greatly diminished the impact of the Weberian Protestant ethics (see Weber 1958, p. 172) in the functioning of the organizational bureaucracy. The economic rise in the Asia-Pacific region drastically reinvented its work ethics (The bureaucratic ethics undergoes a drastic turnaround in a modern world in which success, patronage and wealth defines hard work and commitment to ethics. 'In short, bureaucracy structures for managers an intricate series of moral mazes. Even the inviting paths out of the puzzle often turn out to be invitations to jeopardy.'(Jackall 1983)) into ostentatious production plans and conspicuous consumption replacing the colonial critique of expensive bureaucracy and sensitivity towards the rights of the underprivileged. If at any point ethics has been compromised, it is because the CMCs have not been tracked, monitored, and acted upon with diligence and commitment (Fig. 4).

**E-Governance and Ethical Leadership, Fig. 3** (**a**) Successful e-governance practice. (**b**) Failed e-governance practice

**E-Governance and Ethical Leadership, Fig. 4** Regular/ritual functions which can be brought under e-office activities of governance releasing time for substantive ethical leadership

## Conclusion

e-governance requires a multidimensional ethical governance in contrast to the conventional personalized leadership ethics of the past. The democratic state is inherently driven by the rational choice or hedonistic policies which strengthens its own survival in the form of discretionary and biased decisions, excluding participation of the opponents, marketing unsustainable short-term policies, and making information on grants and finances inaccessible on e-governance. All this is highly unethical therefore as organizations open themselves to the external world, its ethical dimensions become one of self-rationalization but through work and not through positions as in the past. The nature of administration and the state also influences ethics of leadership in e-governance. The paper has established through case studies how ethical leadership can steer through manifold challenges of e-governance. Under this tremendous lack of trust in the organizational leaders, e-based governance came as a mechanical, apolitical, and impassive tool to protect the permeable developmental grants from misuse. This remains till today a most desirable reality of public governance (see the 2016, September, Tallinn, Estonia Meeting of OECD on 'Leading Digital Transformation. . .').

# E-Governance in Bangladesh

Abdur Rahman
Department of Public Administration, Stamford University Bangladesh, Dhaka, Bangladesh

## Synonyms

Cyber governance; Digital administration; Digital governance

## Definition

**E-governance** is a process which helps to provide government service to the citizen as earlier as

possible through technology by dint of which people won't have to go to government office. And by using this system government activities will speed up dramatically.

## Introduction

To keep pace with globalized world, Bangladesh government took an initiative of digitalization in 2001 so that government service can reach at the citizen's doors and decentralization of government for ensuring good governance. Good governance has some important criteria to help government to become accountable and dedicated to the citizen's welfare. Those criteria are accountability, transparency in all sectors, security sector reform, people's participation in decision-making, improve service delivery, decentralization, cavil and political right, efficiency and effectiveness of governmental activities, role of law, sound democracy, easy access to information, equity and last not least eco-friendly development (Gisselquist 2012). According to the Corruption Perception Index (CPI), Bangladesh has scored only 25 out of 100, which makes it as the 13th most corrupted country in the world, and the country's position is unchanged till date (Transparency International 2015). Corruption situation of Bangladesh is the worst even in South Asia and the Country's score is lowest in comparison to other South Asian countries. Within the periphery of South Asia, India holds first position with an aggregate score of 38, Sri Lanka is in the second position (37), and Pakistan, Nepal, and Bangladesh stands in the 3rd, 4th, and 5th position, respectively (Transparency International 2015). In this backdrop, the real scenario of e-governance is also in dire state. The implementation process is neither satisfactory nor visible. Still, a few sectors are not fully operated in digitalized system. It is very difficult to find out a single government organization which is fully operated through digital system. As a result, the status of e-governance of Bangladesh is so poor both from the global as well as regional context. The position of Bangladesh is fifth out of eight countries in south Asia. Sri-Lanka holds the first position, Maldives is in second position, and India and Bhutan stands in third and fourth position, respectively (Table 1).

We have to consider that how many people are going to be involved in decision-making process. At the same time how quickly government is able to implement that decision so that they can solve citizen's problems. A peaceful environment has to be made so that as many people as possible can participate in decision-making and citizen can raise their voice against all kind of odds. Each and every single citizen of the country will be able to get citizen service from the government through digital devices and websites. These are: all kind of government forms, institutions related news, need-based news, and information will be available through a single device, mobile phone, internet, website, and any kind of electronics device available throughout the year. The most important fact is that the whole process will be served automatically without any physical presence of citizen, and this automated process will lead to e-governance system. E-governance can contribute towards promotion of "good

**E-Governance in Bangladesh, Table 1** Adopted from Rahman M. Lutfar

| Name of country | Ranking among country | Ranking out of 193 (global) | EGDI |
|---|---|---|---|
| Sri Lanka | 1st | 74 | 0.5418 |
| Maldives | 2nd | 94 | 0.4813 |
| India | 3rd | 118 | 0.3834 |
| Bhutan | 4th | 143 | 0.2829 |
| Bangladesh | 5th | 148 | 0.2757 |
| Pakistan | 6th | 158 | 0.2580 |
| Nepal | 7th | 165 | 0.2344 |
| Afghanistan | 8th | 173 | 0.1900 |

governance" by way of ensuring greater civic involvements in the government decision-making process, because ultimate objective of e-governance is to ensure good governance which represents citizen satisfaction of providing service of the government official.

## E- Government and Its Conceptual Linkage

"E-Government refers to the use by government agencies of information technologies (such as Wide Area Networks, the Internet, and mobile computing) that have the ability to transform relations with citizen, business, and other arms of government. These technologies can serve a variety of different ends: better delivery of government service to citizen, improved interactions with business and industry, citizen empowerment through access to information, or more efficient government management. The resulting benefits can be less corruption, increased transparency, greater convenience, revenue growth, and/or cost reductions" (World Bank 2001). UNESCO defines e-governance as the exercise of political, economic, and administrative authority in the management of a country's affairs, including citizens, articulation of their interests, and excise of their legal rights and obligations. E-Governance may be understood as the performance of this governance via the electronic medium in order to facilitate an efficient, speedy, and transparent process of disseminating information to the public, and other agencies, and for performing government administration activities. Thus, e-governance is a process which helps to provide government service to the citizen as earlier as possible through technology by dint of which people won't have to go to government office. And by using this system government activities will speed up dramatically.

The service delivery of e-governance can be divided into different categories:

1. G2C (Government to Citizen): Where different required forms and government information can be downloaded from different website.
2. G2B (Government to Business): Different number of business institution needs different types of information to continue their business and starting their business. For example making trade license through online, paying corporate tax, e-tendering, e-commerce, and electronics money transaction, etc.
3. G2G (Government to Government): Interaction that occurred when government and its different organization and different authorities interacts each other.
4. G2E (Government to Employee): Government has to maintain communication with his employment. Traditionally this communication has established through manually like letter or face to face meeting but digitally this communication has established through digital way like e-mailing, video conference, etc.

Stages of e-governance: Layne and Lee (2001) have identified four stages of e-government in their article named Developing Fully Functional E-Government.

1. Stage I- Cataloging: At this stage, government takes an initiative to make website so that citizen can get some required information through website although information is static not dynamic.
2. Stage II- Transaction: At this stage, citizen can get different types of services (tax payment, different type's service bills and fees payment) through digitally or online without any physical presence in the office.
3. Stage III- Vertical integration: At this stage, online service become more extensive and wide and more emphasis has given on transformation on government services. As a result, citizen expectation level will increase. At the same time, communication among local, state, and central government have occurred via online.
4. Stage IV-Horizontal integration: This is the highest and sophisticated level of e-government where everyone is connected via information technology. All information are available in Internet, and citizens get all data form Internet. Government has to maintain a

database of citizen so that any required information can gather in a single click. It is very difficult to reach in this stage for any government. A mega database management system is more complicated to maintain and ensuring its data security.

## Existing Institutional Capacity of E-Governance in Bangladesh

### Ministry of Science and Communication Technology

Ministry of science and technology is promoting technological knowledge for positive change in the society. It is also working for balancing socioeconomic development and sustainable use of environment. This institution has been functioning consecutively to ensure peace and prosperity of the country through maximum utilization of apposite technology. Under the Bangladesh Telecommunication Act 2001, Bangladesh Telecommunication Regulatory Commission (BTRC), an independent, statutory, Regulatory Commission, was established 31st January 2002. According to the Telecommunication act, the Commission has to perform with various tasks. Out of those, establishing, operating, regulating, maintaining telecommunication establishments, and providing various telecom services in the country are the major ones. Besides, fixing charges on the subscribers, ensuring the services for the subscribers, and to ensure people's right are also tasks of BTRC. Finally, for facilitating a quick and stable socioeconomic development and to provide a dependable telecommunication services, Bangladesh Telecommunication Regulatory Commission (BTRC) was formed on 31st January of 2002, under the Bangladesh Telecommunication Regulatory Act 2001. However, the Telecommunication Act (Corrected) bill again has been passed in 2010.

### Bangladesh Computer Council (BCC)

Bangladesh computer council (BCC), established in 1990, has the topmost power body of the government of Bangladesh for assisting and advising the government regarding use of information technology. This institution has been successfully implemented by the ICT in the Prime Minister's Office and other government ministries and departments (BD & UNDP report 2005). BCC can contribute identifying how IT system in concerned office is able to connect, integrate, and exchange data with each other. Even under the project "Development of Infrastructure for IT Applications," BCC has already been able to set up a central database and infrastructure for sustainable application development for E-government. BCC has been consecutively working for securing central database, introducing Cyber law and data security service providing different technological support like cloud service, ensuring uninterruptible network connectivity to different organizations outside of city that cloud-hosted applications are accessible without any interruptions. At the same time, BCC has been providing different training to thousands of government, public, private, and NGO officers directly and most importantly 800 node videoconferencing networks those are maintained by the BCC providing training facilities remotely. Especially some government officer has received training facilities from Bangladesh, Singapore, and India.

### Bangladesh Computer Samity (BCS)

The information and communication technology association of Bangladesh and nongovernmental organization, popularly known as Bangladesh computer samity, established in 1987 (BCS) has been working for last three decades. BCS is not only popularized in Bangladesh but also all over the world. This renowned institution also represents the global and regional different forms like the world information technology and service alliance (WITSA), ASOCIO, and AFACT. The achievement of this institution is massive. Since 1987, this institution has been helping to withdraw duties, tax and VAT from computer and its related product. For the first time, for introducing computer education, syllabus was outlined in SSC (Secondary School Certificate) and HSC (Higher Secondary Certificate) in 1998. BCI also assisted to formulate National ICT policy and is organizing ICT exhibition on regular basis in the

capital city of Dhaka and other mega cities of Bangladesh.

In Bangladesh, various measures have been taken by different government to establish digital governance to ensuring efficiency and ensuring delivery of service to the citizen. For establishing e-governance, Bangladesh government has some strength and capacity. Using these types of strength and capacity, government can easily be transformed into next stage. The core objectives are encourage the orderly development of Telecommunication System that enhance and strengthens the social and economic welfare of Bangladesh and ensure in keeping with the prevalent Social and economic realities of Bangladesh, access to reliable, reasonably price and modern Telecommunication services and internet. At the same time Services for the greatest number of people as far as practicable and ensure the efficiency of the national Telecommunication System and it capability to complete in both the national and international spheres.

**ICT Policy** Although the ICT policy was approved in 2002 but this policy was not implemented during that regime in 2002–2006. National ICT policy review committee was formed in 2008 and The National ICT policy 2009 is the outcome of this committee. The present government felt the necessity of ICT and it is reflecting in the government activities like tax waiver from import of computer and computer accessories and broad band internet connection.

**ICT Training Facilities** Bangladesh computer council, is implementing a project named LICT (leveraging information and communication technology) under the ministry of posts, telecommunication and information technology. This project has launched in January 2013 to develop a vibrant and healthy information technology, to train human resources, to enable services industries efficient and effective by identifying strategies, programs and investment needed for the country. They are trying to make 3,40,000 skilled manpower's for IT and ITES sectors and to expose local IT and ITES capabilities in the international IT market. 2000 government officials have already received training facilities from reputed institution under this project and another 500 government official has been prepared for receiving training. This project is funded by Bangladesh government and World Bank jointly and total worth amount is 572.48 crore BDT.

## Mobile Coverage and Number of Users

Third Generation (3G) mobile network has covered almost whole Bangladesh and mobile operator are providing calling facilities and high speed internet service all over the Bangladesh. It is very easy to spread internet service among the peoples and using mobile internet is very easy while every people can use internet according to their need. A large number of Bangladeshi workers are living in abroad due to meeting their need. If they want to communicate to their family, they have to pay a large amount of money. At the same time, there is no chance to see in live. But now a day it is very easy to communicate their family, video chat with them very chip way. They just manage a 2 multimedia set one for him or her and another for their family. Then they bye internet data and they can talk, massing and video chat with their family as much time as they want. There are around 63.290 million internet subscribers in Bangladesh which number is increasing day by day. This is one of the good sides to achieve digitalization of governance. At the same time government are trying to reduce broadband internet price by cutting vat or surcharge on using internet and internet related device which are imported from foreign countries so that internet user can get internet connection in low rate (Table 2).

There are 131.376 million subscribers in Bangladesh which is covered majority of the population of the country. This is one of the good

**E-Governance in Bangladesh, Table 2** Bangladesh Telecommunication Regulatory Commission, 2016

| Number | Name of operator | Number of internet subscribers (in millions) |
|---|---|---|
| 1 | Mobile internet | 59.658 |
| 2 | Wimax | 0.112 |
| 3 | ISP+ PSTN | 3.520 |
| 4 | Total | 63.290 |

sides to achieve digitalized governance. The number is increasing gradually. All of the operator have already gotten license of 3G so that client can get best quality service of video calling, video conference, live TV facilities, multimedia downloading, and last but not least high speed mobile broadband internet. Grameen phone has already covered whole Bangladesh on 3g network and rests of them are on track. At the same time government are thinking to make auction of 4g network so that they can increase their service (Tables 3 and 4).

## Problems of Implementing Digital Governance in Bangladesh

It is not clear that whether government is opting to find out an appropriate way for solving governance problems of this country. If government can accelerate the e-governance it will ameliorate the economic growth and people's satisfaction as well.

**E-Governance in Bangladesh, Table 3** Bangladesh Telecommunication Regulatory Commission, 2016

| Number | Name of operator | Number of Cell Phone subscribers (in millions) |
|---|---|---|
| 1 | Grammen phone Ltd. (GP) | 56.909 |
| 2 | Banglalink digital communication limited | 31.941 |
| 3 | Robi (Robi) | 27.442 |

|---|---|---|
| 1. | BTCL | 0.7500 |
| 2 | Ranks Telecom Ltd | 0.0592 |
| 3 | BanglaPhone | 0.0002 |
| 4 | Total | 0.8095 |

### Cyber Crime

World has rapidly been advancing due to technological advancement and intellectual advancement as well. Technological advancement brings multifunctional facilities for human being. At the same time human beings are losing their valuable data, highly specific secret documents which worth multi billions of dollars due to technological malfunctioning. And technological malfunctioning is being occurred by some wide spread international and national criminal. Actually we are not talking about general criminal. But discussing about a specialized IT unethical expert those are widely known are cyber criminal (Ahmed 2016). These types of cyber criminal are more lethal than that of ordinary criminal. in some cases, A cyber criminal can be deadly because he or she can be able to hack any kind of electronics device those device have a small computer. They could hack nuclear bomb career (air craft), power plant, dame, oil and gas pipe line, large industries and air traffic control system, financial and non financial institutions even a small private auto mobile etc. This cyber criminal activity is not a recent issue. It was started during the 2nd world war when axis power and allied power, both tried to hack their radio wave each other so that they could control their air defense system, submarine communication.

Bangladesh has significantly changed in the e-governance system in the last decade both in public and private sectors. Now a day's almost all ministries are under fiber optic cable which provides high speed internet connection within the office. Internet service has been spreading up all over the country. Each and every mobile operator has already gotten 3G license and providing high speed internet facilities all over the country. It is easy to get any information for rural people to urban even all over the world. Government has taken initiative to easy access so that people can easily get facilities from it. But recently, Bangladesh one of the most vulnerable situations in the e-banking system at present time, has faced

in serious cyber attack in different public and private bank specially, in the central bank which named is Bangladesh bank. Cybercriminal break into Bangladesh bank payment system and they attempted to steal money by sending some fake payment request to New York based Federal Reserve which worth was almost billion dollars in Federal Reserve (FR) and they have not only successfully transferred million of dollars from the Bangladesh reserves to Sri-Lanka and the Philippine but also erased some traces of their activity so that Low enforcement agency could not trace them in future (Paul 2018).

The current scenario of cybercrimes in Bangladesh can be summarized as follow:

- Over 250 cybercrime cases are under investigation
- About 400 cybercrime cases are under trial at the tribunal
- About 35% of cybercrime cases have been settled through trial
- 1417 cases filed under cyber security Act from 2012 to June 2017
- CID has a forensic lab to help detect or investigate cybercrimes
- And CID received more than 1400 complainants during 2013- July 2017.
- According to police headquarter, 1417 cases were filed under the cyber security act from 2006 to 2012 to June 2017 (Rabbi 2017)

One of the worst case in Bangladesh is, In March, Bangladesh bank, faced one of the biggest banking robberies in world banking history, was attacked by some international cyber criminal who had fraudulent ordered 35 ordered worth 951 million dollar made via swift system, but finally has successfully robbed five order worth 101 million dollar via Pan Asia banking corporation and the rest of the money was sent to Philippines. Using fraudulent order, the money was sent to account at manila based commercial bank crop and finally this money abruptly disappeared into different casino in the Philippines while only $15 million has been retrieved by Bangladesh Bank nearly 2 years later (December 2017). The consequence would have been more dangerous if Bangladesh bank had failed to halt robbing 850 million dollars.

Couple of years back, some cyber criminal, who are known as hacker, hacked some public organization and low enforcement agency's web site specially RAB web site. Most importantly, hacker has hacked the verdict of the war crime tribunal those was published in the national daily newspaper (Haque 2016). Bangladesh, now a day belongs to 134 out of 156 countries on the bases of e-governance system while others south Asian countries like India, Bhutan and Nepal (134, 143 and 142 respectively) are infringement of Bangladesh. However, anonymous are consecutively trying to annihilate the entire cyber security system so that they could be able to accommodate the cyber power and make chaotic situation among mass people. Women are victimized of cyber crime. More than 17,000 complaints were submitted to the ICT division cyber help desk in the 2 years that it was open (Rabbi 2017). Some culprit usually makes hidden video so that they could be able to do blackmail and make demand huge amount of money from victim family. At the same time, some rapist rape and take video to harass the female and consecutively threaten them to upload in the internet if their family take any help from police. After many years of scandal, people are hardly known that veracity.

### Lack of Uninterruptable and High Speed Internet Connection and Costly Data Plan

One of the major problems is uninterruptable connection. Bangladesh is connected to (SE-me-we four) information super highway which is connected fiber optic cable. In our connection inside the country, fiber optic cable is hanging in electric pillar and foot over bridge. Sometimes city corporation worker cut the all kinds of illegal cable those are hanging above the road and electric pillar. As a result, internet users lose their internet connection for 1 or 2 days in some cases for long time. Another major problem is high cost of internet connection and monthly line rate as well. Till internet cost is too high to consider affordable for the commoners. Users need to pay a big amount of money for getting a broad band internet connection and so do monthly line rate (Table 5).

**E-Governance in Bangladesh, Table 5** Developed by the authors and data has been collected from Gp, Banglalink, Airtel, Robi, Teletalk

| Name of company | Data amount | User fee |
|---|---|---|
| Gp | 1.5 gb | 275 tk + 15% vat (1$ = 80 Tk) |
| Banglalink | 1gb | 210 + 15% vat |
| Airtel | 1gb | 199 + 15% vat |
| Robi | 2gb | 264.55 (316) + 16% |
| Teletalk | 1gb | 275 + 15% vat |

At the same time, it is very difficult to select an internet package within so many internet packages such as, Social package, smart package, daily face book package, day package, night package, mega plan, mid plan and heavy package and so on. As a result, internet users fall into a deep dilemma which package is suitable for him/her.

### Lack of Availability of Computer Accessories, Electricity and Training Facilities

Alam (2012) states that computer accessories scenario has found in different government office. In the ministry and division level PC and employee ratio is 0.22 while department and corporation level is 0.065 which comparatively very poor then ministry and division. 30.64% officer are using PCs at the ministry and division level while 32.64 staff use PCs which is a little bit higher than that of officer. Although majority of the ministries, divisions, departments, corporation academic institutions, are connected with internet. But internet speed is not in satisfactory level while a small number of government institutions are connected with high speed broadband internet connection (Chowdhury and Sattar 2012). Another one of the major issues is lack of uninterruptable power supply. Electricity is the key factor to implement the digital government. Although electricity production is increasing dramatically but still we are facing load shedding in different time in a day. Now our electricity generation capacity is increased to 12,725 while BPDB are actually producing around 8271–8300 MW while actual demand is around 8800 MG (Ministry of Power 2016). In the other training facilities is not up to the marl. At the ministry level, only 28% officers are trained while number of staff is little higher. 23% officers are trained at the department/ corporation while trained staffs are very poor (Chowdhury and Sattar 2012).

## Conclusion

Bangladesh has duly endeavored for renovation of public service delivery as it is evident from United Nations commissioned e-Government survey in 2012 pointing out that many countries including Bangladesh have already put in place e-government initiatives and information and communication technologies for the people to further enhance public sector efficiencies and streamline governance systems to support sustainable development. But the position of Bangladesh in south Asia in the sector of e-governance is quite insignificant. However, a lot has to be done to see tangible benefits in the times to come. Meanwhile, Bangladesh present government is trying to catch up the track. If government fail to toke apposite measure, good governance will not be established let alone digital Bangladesh. Although government is going ahead slowly but for ensuring e-governance, arrange computer related training facilities for official and make sure availability of computer and other computer related device. ICT structure has to be built through step by step process. For interconnecting all government organizations IOS (Inter Organizational Systems) has to be built EDI (Electronic Data Interchange) software has to be used. Decentralized or localized database has to be established to ensure autonomy as well as reduces traffic loads in network communication. Make easier and customer oriented of internet connection process and reduced monthly line rate of internet connection. At the same time, make sure uninterruptable internet connection in the office and everywhere.

# E-Government and Corruption

AbdelRahman Ahmed AbdelRahman
Department of International Relations, University of Sharjah, Sharjah, UAE

## Synonyms

Bribes; Bureaucratic corruption; Corruption: E-government; Kickbacks; Online Public Services; Transactional E-government; Web-enabled Provision of Public Servicers

## Definitions

E-Government and corruption:

(a) E-government: This refers to Web-enabled provision of government services and information at the municipal, sub-national, and central or national levels of government. Citizens use government portals at these three levels of government to obtain information and/or to undertake transactions for government services that can be provided online. Such services may include obtaining licenses, filing for taxes, vehicle registration, payments for utility bills, etc.
(b) Corruption: This is generally defined to refer to the use of public office or authority for personal or private gain. Common examples of corruption associated with bureaucratic provision of services to the general public include, inter alia, bribes and kickbacks.

## Introduction

Observers continue to debate the impact of e-government not only on organizational or administrative values (e.g., efficiency, economy, effectiveness, service quality) and on political values (public accountability, democratic responsiveness, equity, transparency), but also on the public bureaucracy itself. The potential for e-government to transform the public bureaucracy has prompted some to claim that information technology has engendered a paradigm shift in the practice of public administration, particularly at the municipal level of government.

Considerable interest in the relationship between e-government and corruption has of late arisen. E-government is found to reduce bureaucratic corruption (Andersen 2009; Elbahnasawy and Revier 2012; Kim 2014). This has now become a stylized fact or an empirical generalization. This has an important policy implication in that e-government may be an effective instrument that contributes to enhancing good governance.

A type of criminal behavior, corruption is hard to observe or measure empirically. In the empirical investigation of the relationship between

e-government and corruption, researchers invariably used cross-national measures of corruption. Those measures are based on surveys of people perceptions of corruption. They are thus indirect measures of the phenomenon.

## How Does E-Government Reduce Corruption?

The use of government portals by members of the public to obtain public services does not require any physical interaction with public officials, thereby precluding opportunities for corrupt acts (e.g., taking bribes and kickbacks). This implies that the more developed and extensive e-government is, the less will be opportunities for corruption and the less will be corruption itself. This is related to the rent-seeking hypothesis which, in the context of government regulation, posits that discretionary authority provides public officials with the opportunity to solicit or extract rents (i.e., bribes/kickbacks) in exchange for desired government services. In other words, e-government, like deregulation, reduces corruption by eliminating the physical contact between members of the general public and public bureaucrats.

In sum, in the provision of public services by public bureaucrats, the physical interface between those bureaucrats and members of the public who seek such services provides opportunities for those bureaucrats to ask for bribes/kickback in return for the services they provide. Transactional e-government (i.e., the use of government portals by members of the public to conduct transactions for public services) eliminates those opportunities for bureaucratic corruption. This happens because e-government removes the physical interface between public bureaucrats and members of the public who must otherwise physically contact those bureaucrats to obtain public services. This is how transactional e-government is conceived to reduce or curb bureaucratic corruption.

Anecdotal evidence from various countries that have transactional e-government in place points to this association between transactional e-government and reduction in bureaucratic corruption. Indeed, several reports from various countries indicate that transactional e-government reduces bureaucratic corruption. Several of such cases are documented and available from annual global corruption reports and from the World Bank. The most notable case is probably Seoul's anticorruption project (known as the OPEN system) which, under the strong leadership and commitment of Seoul's Mayor, successfully introduced and used transactional e-government to combat corruption in Seoul's Municipality.

Plausible though it is to expect the elimination of the physical interaction between public bureaucrats and members of the public to reduce bureaucratic corruption, the phenomenon is determined by a multitude of factors that make it empirically hard to pinpoint its root causes and what influences it. Corruption is likely to be rooted in the cultural, legal, social, political, and economic fabric of society. Nonetheless, a growing body of investigative studies into the causes of corruption corroborates the observation that transactional e-government reduces or curbs bureaucratic corruption. In other words, a growing body of systematic evidence underscores this relationship.

## E-Government and Other Factors Affecting Corruption

E-government is not likely to be the only factor that affects the level of corruption. Indeed, a host of economic, cultural, political, etc. factors exert their influence on corruption both independently of e-government and in interaction with it. For policy makers and researchers, it is important to recognize those factors which may mitigate or altogether neutralize the effect of e-government on bureaucratic corruption. This is likely to be the case in developing countries where computer penetration in society and e-government development is likely to be very limited. Recognizing those factors is important in planning for launching anticorruption e-government initiatives, and may as well be of interest to students and researchers interested in investigating the causes of corruption or in combating it. A brief discussion of some of key factors in this regard is in order.

### Economic Freedom

An important factor that rivals e-government in reducing corruption is economic freedom. In general, previous research has demonstrated that, given the level of economic development and wealth, economic freedom curbs corruption (Paldam 2002; Graeff and Mehlkop 2003; Pieroni and d'Agostino 2013). This is related to the aforementioned rent-seeking hypothesis in that economic freedom, in so far it leads to deregulation, deprives officials of the opportunity to engage in rent seeking.

A multidimensional phenomenon, economic freedom, encompasses components that preclude opportunities for corrupt practices. In general, this is the case with those corrupt practices that arise from the physical interface between those who seek public services and public officials who deliver those services. A case in point is bribes and kickbacks. A key economic freedom component which obviates the need for such interface is deregulation. Cross-country measures of economic freedom are, as to be expected, multinational in nature. They usually encompass, inter alia, freedom from corruption, property rights, fiscal freedom, financial freedom, investment freedom, trade freedom, labor freedom, government spending, etc.

### Inflation

Inflation is an important factor that is found to increase bureaucratic corruption. It may lead public bureaucrats to engage in corruption. High inflation reduces real incomes if nominal incomes (e.g., salaries of public officials) do not increase as inflation increases. Faced with diminishing real incomes during high inflation, public officials may resort to corrupt practices to supplement their incomes. Thus, the effects on corruption of transactional e-government and that of inflation pull in opposite directions, leading to their cancelling out. In poor developing countries with very limited computer and Internet penetration in society, e-government, if any, is highly unlikely to have any effect on corruption during periods of high inflation.

### Level of Society's Wealth

Wealthy countries are more likely to have the infrastructural requirements for e-government. Thus, a country's wealth is expected to positively affect the likelihood of adopting Web-enabled transactions for public services (AbdelRahman 2014). In other words, the wealthier a country is, the more likely that it will have developed e-government. In addition, members of the public in countries with high per capita incomes are likely to have greater access to computers and the Internet than those in countries with low per capita incomes. The implication here is that wealth in society interacts positively with e-government to reduce corruption. Perhaps this is why wealthy countries have highly developed e-government systems and also low level of bureaucratic corruption.

### Political Instability

Political Instability or conflict appears frequently in the empirical literature as a factor leading to corruption (Treisman 2000; Shim and Eom 2008; Pellegrini and Gerlagh 2008). Underpinning the relationship between political instability and corruption is the argument that the former creates conditions of lawlessness that is conducive to corruption. However, the reverse argument has also been made; corruption may also cause political instability (Treisman 2007; Elbahnasawy 2014). This causal relationship appears to be buttressed by a 2015 study on peace and corruption conducted by the Institute of Economics and Peace. The study concludes that increases in police and judicial corruption directly undermine the rule of law, thereby increasing domestic violence and conflict (Institute of Economics and Peace Study, 2015:2). However, limiting corruption in government to only two state institutions (i.e., the judicial system and police) may not capture the full extent of corruption in a country, including those aspects of corruption that may be affected by political instability. For instance, one study has found that political instability motivated officials to embezzle public funds (Campante et al. 2008). Moreover, and rather ironically, the study of the Institute of Economics and Peace has found that out of 16 indicators of domestic peace/violence, political instability is the only indicator that has a statistically significant effect on corruption, though at 0.1 level of significance.

## Impediments to the Effectiveness of E-Government in Reducing Corruption

As an anticorruption tool, e-government faces some potential impediments or challenges, particularly in the context of developing countries. A principal challenge is that Internet penetration in society in those countries is extremely limited. For instance, Internet penetration rates in Africa and Asia are, respectively, 28.3% and 42.2%. These are well below the world penetration rate of 49.7% (Table 1). Ironically, most of these countries have the highest corruption levels in the world. For instance, of the 13 countries that score the lowest (18 or less) on the 2016 Corruption Perceptions Index, only 1 (Venezuela) is not in Africa or Asia. By the same token, of the 94 countries scoring 39 or less on this index, only 26 countries are not in Africa or Asia. Under those conditions, one would not expect Web-enabled government information and services to have but an insignificant impact on the level of corruption. Moreover, access to and use of e-government is likely to benefit urban residents to the exclusion of rural dwellers. This raises the digital divide issue in the societies of those countries, and thereby underscores asymmetry and concomitant inequity in Web-enabled access to government information and services.

Another impediment to the effectiveness of e-government in combating corruption is that its online services are limited, as they do not cover the whole gamut of government services. For instance, online services do not cover street-level public bureaucrats (e.g., police and traffic officers) or bureaucrats in services that require physical interface between service providers and members of the public (e.g., teaching, nursing, geriatrics, etc.). In some developing countries, those bureaucrats are reported to have the highest levels of corruption. Thus, according to the 2013 Global Corruption Barometer (GCB), most people surveyed in 36 countries saw the police as the most corrupt institution. Fifty-three percent of the people surveyed in those countries reported having paid a bribe to the police. Similarly, the 2015 GCB reported that most people surveyed across Africa saw the police as the most corrupt government institution (GCB 2015: 10). Obviously, this is potentially detrimental to the rule of law and law enforcement which is crucial for the fight against corruption.

In view of the potential limitations of e-government to provide government information and online services to most people in developing countries, it is not suggested here that e-government is not useful in the fight against corruption. However, given those limitations, traditional media (e.g., TV, radio, the press, phones, etc.) have the potential to be more effective in providing government information and services to the general public. The use of such media is likely to fill in the gap associated with using Web-based media, which are characterized by limited societal penetration in those countries. Thus, in view of their greater outreach capability,

**E-Government and Corruption, Table 1** World Internet usage and population statistics (March 31, 2017)

| World region | Population (2017) | Internet users(as of March 31, 2017) | Penetration rate(% of population) |
|---|---|---|---|
| Africa | 1,246,504,865 | 353,121,578 | 28.3 |
| Asia | 4,148,177,672 | 1,874,136,654 | 45.2 |
| Europe | 822,710,362 | 636,971,824 | 77.4 |
| Latin America/ Caribbean | 647,604,645 | 385,919,382 | 59.6 |
| Middle East | 250,327,574 | 141,931,765 | 56.7 |
| North America | 363,224,006 | 320,068,243 | 88.1 |
| Oceania/Australia | 40,479,846 | 27,549,054 | 68.1 |
| World total | 7,519,028,970 | 3,739,698,500 | 49.7 |

Source: Internet World Stats: http://www.internetworldstats.com/stats.htm. Accessed on August 7, 2017

traditional media may be more effective tools for making government transparent, accountable, and hence less corrupt.

In passing, it is worth noting that social media (e.g., blogs, Twitter, YouTube, Text messaging, Wikis, Facebook, etc.) have of late been highlighted as tools for e-transparency, civic engagement, and public accountability. This type of Web-based media is likely to be effective as e-transparency tools in developed countries in Europe and North America, on account of the high computer and Internet penetration found in these countries (Table 1). However, this is highly unlikely to be the case in developing countries where computer and Internet penetration rates are very low. It is worth noting that even in developed countries like the United States such media have accessibility and inclusion challenges.

A third impediment to the effectiveness of e-government in reducing corruption is the propensity of public bureaucrats to resist the introduction of Web-enabled provision of public services or even to bring about the failure of e-government projects once they start (Aladwani 2016). There are at least three reasons why public bureaucrats resist the introduction of Web-enabled provision of public services. First, online provision of public services removes or at least reduces administrative discretion. Street-level bureaucrats, armed with consequential administrative discretion, have no place in today's IT-based public management, as street-level bureaucracy is being replaced by screen-level bureaucracy. According to Bovens and Zouridis (2002), screen-level bureaucracy is a decision-making process where public officials, when they are in direct contact with members of the public at all, communicate with them through computer screen. However, screen-level of bureaucracy itself is withering away in favor of system-level bureaucracies which transfer administrative discretion to system designers and other officials engaged in data processing. This transformation removes face-to-face interactions between members of the public and administrators (other than those bureaucrats who merely interface between the public and systems such as help-desk workers) and, concomitantly, raises the possibility of the withering away of public bureaucrats exercising administrative discretion.

E-government may also lead to job losses in the public bureaucracy. The new term for this effect is organizational disintermediation, where Internet-based systems enhance efficiency by decreasing layers of middle management (Swiss 2003).

Finally, e-government may also lead to loss of incomes from bureaucratic corruption associated with the physical interface between the public and public officials. More specifically, by eliminating such interface, online transactions for public services remove the opportunity for bureaucratic corruption. As previously noted, reports from various countries indicate that e-government, specifically transactional e-government, reduces bureaucratic corruption. However, while e-government may detect and remove corruption, it may also have no impact on corruption and may even just "upskill" it (Heeks 1999).

## Conclusion

A general conclusion that can be drawn from the relationship between e-government and corruption is that e-government, in combination with other factors, reduces bureaucratic corruption. However, e-government is not the only factor having this effect. To be sure, other factors, particularly economic freedom interacting with the level of economic development, also has this salutary effect. Nevertheless, e-government, in its own right, appears to be at least responsible for some of this effect insofar as it eliminates the physical interaction between economic agents (i.e., individuals and business firms) and public officials. The absence of such an interface forestalls any opportunities for a key component of corruption; namely, bribes and kickbacks.

This salutary effect is the function of transactional e-government or online provision of government services which does not require any physical interface between members of the public and public officials. The policy implication of this effect is fairly obvious; an anti-corruption strategy should embrace a strengthened role for e-government. More specifically, the scope of

online services should be widened to include more services. At present, online services are mainly provided for such things as application for car registration, driver licenses, filing tax forms, business licenses, etc. Widening C2G and B2G to incorporate a wider range of web-enabled government services could contribute to promoting efficiency, effectiveness, and responsiveness in government service provision.

An expanded scope for online government services could be a catalyst for expanding the scope of economic freedom. A wider range of online services could provide the impetus for some measure of deregulation which is a key component of economic freedom. E-government could be an effective conduit for good governance insofar as it contributes to curbing corruption in government and facilitating economic freedom which also has the effect of curbing corruption. In other words, e-government could promote good governance directly through reducing corruption and indirectly through facilitating economic freedom which, in turn, also reduces corruption.

Investigation into the relationship between e-government and corruption reveals that as society achieves a high level of economic growth and development, three factors converge to reduce or curb corruption in public service: GDP per capita, economic freedom, and e-government development. These forces are mutually reinforcing. A high level of economic growth and development enables countries to have more developed e-government infrastructure and services. A developed e-government facilitates deregulation which is an important component of economic freedom. In turn, economic freedom may boost investment as economic agents are free from the shackles of government regulation.

The observation that these factors come together to curb corruption suggests that there may be synergies associated with them that generate this effect on corruption. The implication here is that more research may be needed to explore such synergies. Case or country-specific studies may provide insight into synergism among these factors in curbing corruption. Such a case is the OPEN System in South Korea. As previously noted, this system drastically reduced corruption in Seoul Municipal Government. The system involved the introduction of transactional e-government and limiting the discretion of public bureaucrats. In addition, the system was implemented when South Korea was a country with a relatively high GDP per capita.

School of Economics and Management, Jiangxi University of Science and Technology, Ganzhou, Jiangxi, People's Republic of China

## Synonyms

Electronic government; Information and communication technology; Public sector

## Definitions

E-government: Electronic government (e-government) is the use of appropriate information and communication technologies (ICTs) in government public administration systems to improve the delivery and access to public services and to enhance the interaction between government agencies and citizens.

Public Administration: Public administration has to do with the structure and organizational workings of government agencies responsible for the management and administration of government functions.

ICT: Information and communications technology (ICT) refers to technologies that provide access to information through telecommunications such as the Internet, wireless networks, cell phones, and other communication mediums.

## Introduction

Public administration and public management systems all over the world ranging from developed to developing countries to less developed countries have seen dramatic and dynamic changes since the concept of e-government was introduced into the sphere of public administration. E-government is the use of appropriate information and communication technologies by government to enhance its delivery of public services to its constituents such as citizens, businesses, and the general public. ICTs are therefore the major components integrating and supporting the development and growth of e-government initiatives (Joseph and Kitlan 2008). The digitization of public administration and its related services and information is termed as e-government. The use of the Internet and its associated technologies to improve government responsiveness and empower citizens is known as e-government (Rodriguez Bolivar et al. 2007). The application of these advance technologies according to Rodriguez Bolivar et al. (2007) has transformed and continues to change how public sector organizations and public administration systems interact with the public. Public administration can be seen as the products and procedures that the government implements to actively interact with citizens, businesses, employees, and other government agencies. E-government, therefore, is a catalyst to implement products, procedures, and services to the government's stakeholders such as businesses, citizens, employers, and government agencies.

The purpose of this chapter is to dissect, discuss, and highlight the vital changes and impacts that the concept of e-government has had and continue to bring to public administration. The rest of this chapter is organized as follows: the discussion of the background of e-government along with its challenges, examining the major impact of e-government on public administration, and finally, the discussion and conclusion of this chapter.

## E-Government

Electronic government (e-government) is considered as the process of creating public value through the integration of ICTs such as the Internet by government to interact with citizens and the general public (Joseph and Kitlan 2008). Broadly, e-government is the situation in which administrative, legislative, and judicial agencies both at the central and local government level digitize their internal and external operations and utilize networked systems efficiently to achieve better quality in the provision of public services (Palvia and Sharma 2007). It is also seen as the continuous optimization of service delivery, constituency participation, and governance by transforming internal and external relationships through technology, the Internet and new media (Palvia and Sharma 2007). Ultimately, the integration of ICT in government public administration systems would contribute to the promotion of efficient and effective government, greater facilitation of access to government services and information and thus empowering citizens and the general public to hold government accountable. The common underlining theme that encompasses e-government has to do with the use of information technology such as the Internet, to improve the delivery of public services to citizens, businesses, and other government agencies (Palvia and Sharma 2007).

The nature and kind of e-government are dependent on the extent of the interaction that occurs with government. These interactions are Government-to-Government interactions (G2G), Government-to-Citizen interaction (G2C), Government-to-Business interactions (G2B), and Government-to-Employees interactions (G2E). The Citizen-to-Government interaction (C2G) has to do with the communications and interactions between government and citizens and vice versa. This form of interaction seeks great a customer-centric approach toward the delivery of government public services to citizens. The Government-to-Government forms of e-government has to do with the interaction that occurs between governments be it central and local government, municipal and central government, regional and district interaction for the payment of local and central government taxes, and transfer of documents and information. The transfer of information from a lower level of government to a higher level of government is known as the vertical integration in e-government development (Joseph and Kitlan 2008). The G2G interaction can also happen horizontally where a department interacts with another same level as a government department (Joseph and Kitlan 2008). In addition, the Government-to-Business (G2B) form of interaction is the kind of communication and flow of information and services from government bodies and agencies to business sector industries. The Government-to-Employee (G2E) form of interaction in e-government is based on the human resources management component of the relationship between the government sector and employees. The G2E forms of e-government lead to improve strategic planning, cost reduction, and service improvement between management and employees (Joseph and Kitlan 2008).

The broader view of e-government that has to do with the entire range of government roles and activities influenced by the use of information and communication technologies can be grouped into four domains into which governance and public administration can be classified (Brown 2005). The first domain of e-government is concerned with the jurisdiction of the state and its roles and relationship within the economy and society (Brown 2005). Based on e-government, government takes appropriate measures to promote enterprise creation and innovation in the knowledge-based economy through regulatory and program activity and development of national technology infrastructure (Brown 2005). The economy concerns within the first domain of e-government lead government to some social policy concerns through a knowledge economy that necessitates possession of new skills and human capital investment (Brown 2005). This domain of e-government is designed to eliminate barriers and building capacity to empower sections of society that are disadvantage and marginalized by the workings of the knowledge economy (Brown 2005).

The second domain of e-government has to do with the legitimacy of the state and its relationship with its citizens and the rule of law which evolves into e-democracy and e-governance (Brown 2005). A major concern of this domain is democratic decision-making using electronic technologies such as e-voting and electronic channels for public consultation on government decisions and actions (Brown 2005). This domain thus builds new mechanisms and vehicles for delivery of services to the public, emphasizing self-service and citizen empowerment (Brown 2005). Due to the huge amount of personal information generated at this stage, government is under obligation to pass the needed legislation to promote privacy and protection of personal and transaction information (Brown 2005). E-government thus necessitates the development of new laws to deal with matters about electronic crimes, ranging from hacking to identify theft and fraud and the protection of intellectual property (Brown 2005).

The third domain of e-government concerns the operations of state institutions and opening up issues of electronic public administration. Within this domain, the concern is the effect of ICTs on government operations from creating a networked internal working environment to demand new skills in the civil service and new administrative processes (Brown 2005). And lastly, the fourth domain of e-government is concerned with the state in the international arena in terms of its relationship, interaction with a state institution, international institutions, and international private and nongovernmental bodies (Brown 2005). The nature of these relationships is influenced by ICTs within the electronic environment where government has access not only to each other, but at all levels of administration and without having to abide by the formalities of interstate interactions/relations but also to their respective citizens as well (Brown 2005).

### Challenges of Implementing E-Government

The development and implementation of e-government are herald with many challenges. Notable among them are infrastructure development, law and public policy, digital divide, e-literacy, accessibility, trust, privacy, security, transparency, interoperability, records management, education and marketing, public/private sector competition/collaboration, workforce issues, cost structures, and benchmarking (Almarabeh and AbuAli 2010). The summarized e-government challenges alongside their recommendations are shown in Table 1.

## Effect of E-Government on Public Administration

E-government development presents many benefits in public administration. Some of these benefits are lower administrative costs to the government sector; provide more efficient government operations, stronger, and closer relationships between citizens and government; and improved service delivery to citizens (Joseph and Kitlan 2008). Others are to ensure greater access to decision-making, empowerment of citizens, and more transparency in government. There are three advantages when it comes to e-government in public administration such as reduced paper usage, transaction efficiency, and improved governance (Joseph and Kitlan 2008). A broader understanding of the impact of e-government on the public administration can be interrogated in these directions: citizen-centered services, information as a public resource, new skills and relationships, and impact on accountability and management models (Brown 2005).

### Citizen-Centered Services

One of the major reasons for the introduction of e-government in the public administration system is to provide public services that meet citizens' requirements and demand for quality of public services from public sector agencies and government. According to Brown 2005, the most important and powerful concept inherent in e-government is client-centered service delivery. It ensures that government public services are developed and designed from the view of meeting citizens' demands and thus encouraging citizens to perform/meet their civic obligation (Brown 2005). E-government can facilitate the provision of citizen-centered service in public

**E-Government and Public Administration, Table 1** E-government challenges and recommendations (Almarabeh and AbuAli 2010)

| E-government challenge | Recommendation solutions |
|---|---|
| **Infrastructure development**<br>All countries implementing e-government have struggled to develop a basic infrastructure to take advantage of new technologies and communications tools. Many developing countries, even if possessing the will, do not have the infrastructure necessary to immediately deploy e-government services throughout their territory | Develop projects that are compatible with the nation's telecom infrastructure<br>Use public access kiosks and mobile centers if telecommunication density is low<br>Introduce telecom competition and lift regulations on wireless and other digital technologies to accelerate their deployment<br>Build on the microenterprise model to bring connectivity to underserved areas and ensure sustainability<br>Consider the government's current use of technology and learn from past successes and failures<br>Establish an action framework at the beginning of the process to allow for a rational and coordinated investment effort down the road |
| **Law and public policy**<br>The application of information technology and communication (ICT) to government may encounter legal or policy barriers. Legislatures must ensure that laws are updated to recognize electronic documents and transactions. Policymakers implementing e-government must consider the impact of law and public policy | Consult with stakeholders to assess how existing laws may impede the desired results<br>Give legal status to online publication of government information<br>Clarify laws and regulations to allow electronic filings with government agencies<br>Reform processes by simplifying regulations and procedures |
| **Digital divide**<br>The digital divide is the gap between people who have access to the Internet and those who do not. Those without access cannot learn essential computer skills, cannot access information that can provide economic opportunities, and cannot share in the benefits of e-government | Provide communal access through village computer centers or kiosks<br>Combine access with training<br>Provide incentives to the private sector to donate equipment and training<br>Emphasize local language and content tailored to different communities<br>Use for-profit entrepreneurs to build and sustain access points in small communities |
| **E-literacy**<br>E-literacy refers to marginalized groups who are unable to make use of information and communication technologies because they are not computer literate. With the digital revolution, there is a very real danger that the world will be divided into the "information rich" and the "information poor." E-government has the potential of either equalizing access to government and its services or increasing the barriers to participation | Ensure that content is in local languages and that interfaces are easy to use<br>Develop applications that use speech or pictures in addition to, or instead of, written text<br>Include an educational component in e-government projects<br>Provide aides at access points who can train citizens in basic computer skills<br>Create programs that include traditional media, like radio programs or newspaper columns, where citizens can learn about e-government |
| **Accessibility**<br>Governments must serve all members of society irrespective of their physical capabilities (disabled people: those who are blind, deaf, or otherwise handicapped). Online services will have to be designed with appropriate interfaces | From the outset, design applications that accommodate the disabled, such as an audio option for the blind<br>Establish as a legal requirement that the government must adopt technology to assist the disabled |
| **Trust**<br>To be successful, e-government projects must build trust within agencies, between agencies, across governments, and with businesses, NGOs, and citizens | Map key internal and external partners and build a strategy to keep open lines of communication<br>Start with short-term projects that yield early results. This helps build trust and could help point to areas for larger-scale ventures<br>Strong leadership can help build confidence in programs |

(continued)

**E-Government and Public Administration, Table 1** (continued)

| E-government challenge | Recommendation solutions |
|---|---|
| **Privacy**<br>Governments must be responsible custodians of the enormous amounts of personal information they hold. Governments collect vast quantities of data on their citizens through everyday transactions. Protecting the privacy of citizens' personal information stored on these databases, while making effective use of the information contained in them is a vitally important issue | Educate and train government officials on the importance of privacy<br>Design applications that integrate privacy protections<br>Follow "fair information practices" Minimize the collection and retention of personal information<br>Limit access to personally identifiable information – do not automatically allow employees to tap into databases of personally identifiable information |
| **Security**<br>Security is costly, but must be addressed in the design phase, as security breaches can shatter public trust in e-government. Trust is a vitally important component of e-government projects. Without trust, citizens who may already be leery of using technology may avoid and even shun the use of online services that ask for detailed personal information | Designate a senior official responsible for computer security<br>Continually assess systems to make sure that security precautions are being implemented<br>Backup information regularly and store backups in a separate location<br>When it comes to personal information, keep information collection to a minimum, and do not disclose personal information without express prior consent<br>Evaluate performance of system managers in adhering to sound security practices |
| **Transparency**<br>Citizens too rarely understand how government decisions are made. This lack of transparency prevents the public from actively participating in government and from raising questions or protesting unfair or ill-advised decisions. A lack of transparency can conceal official graft or favoritism | Post online rules, regulations, and requirements for government services (such as requirements for obtaining a license) to minimize subjective actions by officials<br>Highly placed public officials can expedite transparency and accountability efforts by making their offices positive examples of openness<br>When putting services online, give citizens the ability to track the status of their applications<br>Train civil servants and provide incentives to reform<br>Integrate transparency and process reform to simplify regulations and procedures |
| **Interoperability**<br>Putting incompatible record formats online neither simplifies nor reduces the workload imposed on people and government officials. Reliable e-government requires a comprehensive overhaul of legacy systems | Map and assess existing record systems<br>Identify and reform regulatory schemes that make interaction with the government onerous<br>Use common standards throughout the government to shorten development time and ensure compatibility<br>Adopt a common IT infrastructure for the government |
| **Records management**<br>Better information management can help officials identify barriers to more efficient government. An information management framework is necessary to make sense of available data. Without this framework, policymakers could not derive useful analysis quickly enough to react to social and economic developments | Encourage data sharing and cooperation between government departments<br>Streamline offline record-keeping processes to make the transformation to online publication easier<br>Creation and standardization of metadata are critical for conducting successful data searches across institutions and networks |
| **Education and marketing**<br>E-government services are only useful if people know about them. Education and outreach programs will be needed | Develop publicity and training campaigns that will engage the public about e-government initiatives<br>Conduct research to ensure that online services respond to actual needs and that the implementation suits the target audience |
| **Public/private competition/collaboration**<br>Answering the question of where government controls end and the private sector takes over in e-government efforts | Forge multi-sector partnerships<br>Review and reassess laws and policies that impede public/private cooperation<br>Ensure that agreements with contractors and partners are equitable and can be reviewed and revised over time<br>Seek assistance and involvement from organizations that |

(continued)

E

**E-Government and Public Administration, Table 1** (continued)

| E-government challenge | Recommendation solutions |
|---|---|
| | already have experience in providing services and information using the same or similar technologies |
| **Workforce issues**<br>Human resources must be structured and managed with e-government goals in mind. A well-trained and motivated workforce is critical to e-government success | Articulate a timeline for implementation in a step-by-step manner, so the reforms will not seem overwhelming to the bureaucracy<br>Hold regular meetings between e-government policy leaders and the affected workforce, so employees are active participants in the process<br>Create incentives by rewarding individuals and agencies that apply the reforms rapidly |
| **Cost structures**<br>While planning and budgeting in a changing climate is difficult, governments should seek to invest in sustainable programs that can produce savings | Avoid advertising-based or fee-based services. They have generally not been sustainable<br>Articulate functionalities clearly and try not to add details that will push budgets into deficit<br>Develop projects that are achievable with resources available<br>Consider the government's current use of technology, and study past successes and failures<br>Designate an officer or organizing body that will oversee cost |
| **Benchmarking**<br>Governments must regularly evaluate the progress and effectiveness of their e-government investments to determine whether stated goals and objectives are being met on schedule | Designate an office to oversee e-government implementation<br>Make sure the office is sufficiently funded and is recognized by all relevant agencies and departments<br>Conduct regular audits to ensure progress is being made to achieve stated goals<br>Review benchmarks regularly to ensure that accurate measures are appropriate for rapidly changing technology<br>Create a data collection system to support program operations and "before and after" surveys of knowledge, skills, and applications among participating organizations to assess program impact<br>A common IT infrastructure and architecture standard is key to ensuring that ongoing development takes place in a coherent and integrated way<br>Advanced planning of common IT infrastructure standards results in shortened development time and system compatibility<br>Governments must regularly evaluate the progress and effectiveness of their e-government investments to determine whether stated goals and objectives are being met on schedule<br>Quantitative measures can be as beneficial as qualitative ones |

administration systems through the simplification of processes involved in the access and delivery of services. Citizen-centered services place much emphasis on the transformation of service delivery by using concepts of business process and reengineering (Brown 2005). One important component of the citizen-centered model of service is self-service which enables the provision of services to citizens 24/7.

## Information as Public Resource

Another impact of e-government on public administration is the strengthening of the public sector administration systems to be able to store, process, and manage a large amount of information and data. Information in this context is regarded as a key resource of government which enables the government to enact the right legislation, policies, and institutions (Brown 2005) to manage and

process such information. E-government thus has changed and transformed the traditional records management and documentation of government information and data through digitization. This digitization of the traditional record management and documentation in public administration ensures that proper collection and production of government information when it comes to its usage, storage, retrieval, dissemination, protection, and disposal (Brown 2005).

### New Skills and Relationships

E-government in public administration demands the development of new skills and building of strategic relationships both for the public sector works and the government itself. E-government provides the needed technology that can shape the environment in which public administration operates and the knowledge and skills required by public service managers and works (Brown 2005). E-government has enabled the use of new working methodologies and processes that emphasize on group collaboration and information sharing across the vertical division of labor (Brown 2005). Public sector works thus are forced to embrace and develop new skills to be able to acquire the needed capacity to manage the integration of e-government into the public administration system. This integration enables the creation of an interdependent relationship between government and policymakers, program administrators, and technical specialists. One critical strategic relationship that government builds as a result of e-government is the relationship with the private sector (Brown 2005). This is an important relationship since government cannot be self-sufficient in the adoption, development, and use of electronic technologies and thus imperative to collaborate with the private sector to build the needed e-government infrastructure (Brown 2005). This strategic relationship with the private sector empowers the government to tape into consultants for policy and technical advice for the implementation of new information systems and technology-enabled programs and services (Brown 2005). The government can, therefore, depend on the skills and capabilities of the private sector to augment the unavailable or lacked skills and technological know-how in the public sector. The underlying challenges in the public sector empower government to seek to delivery public services by building new working relationship with private sector organizations (Bertot et al. 2016; Klievink et al. 2016; Scupola and Zanfei 2016).

### Impact on Accountability and Management Models

Another major impact of e-government on public administration is on its ability to improve the accountability and management models of government and other sector agencies. A major concern over the years in public administration is the lack of proper accountability of public sector managers and government due to the nondisclosure of crucial information and data to the public. The client service concept in e-government deepens and changes the relationship between the public, the civil service, and elected representatives (Brown 2005). E-government can foster better accountability in public administration systems and bureaucracies by promoting greater financial accountability, openness, and transparency measures as a tool to control government by citizens who are the taxpayers (Pina et al. 2007). E-government can also contribute to improving the transparency in the decision-making processes by making information and data easily accessible through publishing of government debates and minutes, budgets and expenditure statements, and outcomes and rationales for key decisions and permitting online tracking of services and applications. Also, e-government administrative components like computerized treasury, integrated financial management information systems, and human resource management systems contribute to greater efficiency in public administration.

## Discussion and Conclusion

E-government development and integration into public administration have reshaped the traditional concept of public administration. E-government has demonstrated that it is a permanent and dynamic agent of reform in public administration in the public sector. The impacts continue to be visible in all parts of public sector administration systems in reforming and redesigning the functions of governmental organizations from local to central government agencies. The integration of

technology into improving the fundamentals of public administration has come to stay, and thus it is imperative that government address the challenges that front e-government in public administration. Tackling the challenges will ensure that the intended purpose of e-government in public administration and the public sector can be sustainably achieved. To sustain the positive impact of e-government on the public administration system, key stakeholders such as citizens, employees, and businesses including the private sector and government agencies must continue to collaborate and cooperate maximally in terms of the development of e-government initiatives in public administration and the public sector.

## Introduction

Federal E-government legislation has continued to evolve over the last two decades as the proliferation of the use of information technology (IT) in both public and private sector has continued. While many have examined specific e-government legislation and its relation to various concepts of public administration, a comprehensive timeline of all related federal e-government legislation has not been conducted. This chapter presents a comprehensive timeline of these federal laws and analyzes each for their purpose and focus. These laws are

also contextualized within the past three presidential administrations in order to analyze their specific priorities, as well as the evolving nature of their technology needs. Such reference is highly valuable as a source for students and researchers to understand the progression of federal e-government legislation.

## Phases of Federal E-government

"E-government" was historically a limited concept, but many federal initiatives addressed the guidelines for its effective implementation and subsequently led to its widespread inclusion in the United States. Through different administrations, e-government efforts evolved toward greater levels of use of information and communication technology (ICT). Tables 1, 2, 3, and 4 provide a comprehensive timeline of e-government precursors, efforts, and goals.

### The Early Years (Before 1992)

Prior to 1992, computing technology was in its infancy compared to the years following the High Performance Computing Act of 1991. With the Cold War dominating policies and with surveillance efforts on the minds of many congressional and presidential bodies, the primary goal became the limiting of potential security breaches in e-government. Therefore, technology-related federal legislation concentrated on privacy protections with government surveillance. The Foreign Intelligence Surveillance Act, Comprehensive Crime Control Act, Computer Fraud and Abuse Act of 1986, and Computer Security Act all show shifts toward legislation that protects both government and computer systems from sabotage both foreign and domestic.

Still, during this time there were also efforts to protect consumers of technology and the privacy and security of users in regard to the government's authority over their personal information. The Privacy Act and Freedom of Information Act (FOIA) for the first time set national standards for personal protections and privacy/transparency in government record acquisition. Although computing technology and the Internet were in very early stages, these laws were fundamental for future IT legislations. Table 1 highlights security technology implementations and preliminary security/privacy standards.

The first steps toward increased accountability and transparency in government records are discussed below. The Paperwork Reduction Act of 1980 promoted IT for enhancing efficiency, cost savings, and performance management. Later versions of this law expanded computing capabilities in federal government. Similarly, the High Performance and Computing Act of 1991 strongly supported IT development. Congressional/executive dialogue included accountability, efficiency, cost savings, and the need for technological superiority (i.e., the "information superhighway"). There were several IT "booms," and future congressional legislation emphasized greater IT integration. Specifically, the High Performance and Computing Act can be seen as the law that sets the new precedent for e-government, characterizing a paradigm shift toward a government more encapsulated by computing services.

### The Clinton Administration (1992–2000)

The Clinton administration fully embraced the IT "booms" that were touted by the High Performance and Computing Act, and it shifted attention from house surveillance/protections to effective governance as outlined in Table 2. The goal of many of the bills passed during the Clinton administration became the effective use of e-government to enhance management within government or increase the effectiveness of government services. The Government Performance and Results Act began this initiative as it promoted increased effectiveness with technology taking a central role in processes that needed improvement. Other bills saw the inclusion of technology, among critical goals of the bill.

Limitation of waste also became a central concern and The Paperwork Reduction Act was an amendment to highlight IT benefits in government (e.g., cost savings, efficiency, and performance), as well as expanded government transparency, improved access to information, and accountability of computing services. Later, the bill was expanded upon again to increase process efficiency through

**E-Government Policy and Legislation: A Chronological Timeline, Table 1** Early stages E-government laws

| IT law | Year | Congress number | Law number | Purpose | Focus |
|---|---|---|---|---|---|
| **Freedom of Information Act (United States)** | 1966 | 89th | 89-554 | • Ensure that government records are now subject to disclosure<br>• Ensure full or partial disclosure of previously unreleased information and documents<br>• Create greater government transparency | • Transparency<br>• Access to information |
| **Privacy Act** | 1974 | 93rd | 93-579 | • Establish Code of Fair Information Practices for the collection, maintenance, use, and dissemination of personally identifiable information maintained in federal records systems<br>• Require that federal agencies give the public notice of their systems of records by publishing them to the Federal Register<br>• Prohibit the disclosure of information from a system without written consent from an individual, pursuant to 1 of 12 exceptions outlined in the law<br>• Allow individuals to seek access to and amend their records<br>• Set forth agency record keeping requirements | • Transparency<br>• Privacy<br>• Accountability |
| **Foreign Intelligence Surveillance Act** | 1978 | 95th | 95-511 | • Outline procedures for physical and electronic surveillance of "foreign powers" and "agents of foreign powers"<br>• This may include American citizens and permanent residents suspected of terrorism | • Security |
| **Paperwork Reduction Act** | 1980 | 96th | 96-511 | • Minimize the total burden of paperwork imposed by the federal government on private businesses and citizens<br>• Establish the Office of Information and Regulatory Affairs (OIRA) which is within the Office of Management and Budget (OMB) to oversee collection of information<br>• Improve the dissemination of public information | • Efficiency<br>• Cost saving<br>• Accountability<br>• Transparency<br>• Access to information |
| **Comprehensive Crime Control Act** | 1984 | 98th | 98-473 | • Extend the United States Secret Service's jurisdiction over credit card fraud and computer fraud | • Security |
| **Computer Fraud and Abuse Act of 1986** | 1986 | 99th | 99-612 | • Amendment to the Comprehensive Crime Control Act of 1984<br>• Limit federal jurisdiction to those computers that had a "compelling federal interest" (defined as protected computers) which included computers of the federal government or certain financial entities who are suspected of involvement | • Privacy<br>• Security |

(continued)

**E-Government Policy and Legislation: A Chronological Timeline, Table 1** (continued)

| IT law | Year | Congress number | Law number | Purpose | Focus |
|---|---|---|---|---|---|
| | | | | • Criminalize additional computer-related acts such as accessing or defrauding government computers<br>• Address distribution of malicious code<br>• Criminalize trafficking of passwords | |
| **Electronic Communications Privacy Act (ECPA)** | 1986 | 99th | 99-508 | • Extend government restrictions on wiretaps to include electronic data transmitted by computer<br>• Prohibit access to stored electronic communications<br>• Prevent unauthorized government access to private electronic communications | • Privacy<br>• Security |
| **Computer Security Act** | 1987 | 100th | 100-235 | • Improve security and privacy of sensitive information in federal computer systems<br>• Establish minimum security practices under the National Institute of Standards and Technology (NIST)<br>• Mandate security training for federal employees who use these systems | • Privacy<br>• Security<br>• Accountability |
| **Computer Matching and Privacy Protection Act** | 1988 | 100th | 100-503 | • Amend the Privacy Act of 1974<br>• Add protections for privacy of subjects used in automated computer matching programs<br>• Protect individuals from adverse treatments and ensures due process related to computer matching without verification of data by the agency<br>• Establish a data integrity board at each agency to oversee implementation of the Act | • Privacy<br>• Security |
| **High Performance Computing Act** | 1991 | 102nd | 102-194 | • Build efforts toward a national networking infrastructure "information superhighway"<br>• Emphasize high performance computing and technological development including the mosaic web browser software, which acted as a springboard to the Internet and high speed fiber optic computing network<br>• Touted as responsible for tech boom of the 1990s<br>• Lead to National Information Infrastructure<br>• Lead to founding of the National Research and Education Network (NREN) | • Accountability<br>• Efficiency<br>• Technological superiority<br>• Cost savings |

the Government Paperwork Elimination Act. Consumer protection also took on a heavier role and amendments to the FOIA in 1996 included broader protections and access to information.

Still, perhaps the most technology centric bills to emerge during this time were the Telecommunication Act and Clinger-Cohen Act. Each emphasized technological superiority, while the

**E-Government Policy and Legislation: A Chronological Timeline, Table 2** Clinton era E-government laws

| IT law | Year | Congress number | Law number | Purpose | Focus |
|---|---|---|---|---|---|
| **The Government Performance and Results Act** | 1993 | 103rd | 103-62 | • Establish goals for government agencies in performance management<br>• Aid congressional committees in their capabilities to amend, suspend, or bring about programs based performance management standards<br>• Improve the performance, efficiency, and effectiveness of all federal agencies<br>• Develop and improve operational processes, skills, technology, human, capital information, and other resources needed in agencies | • Accountability<br>• Efficiency<br>• Performance management |
| **Government Management Reform Act** | 1993 | 103rd | 103-356 | • Provide for a more effective, efficient, and responsive government<br>• Calls for a government-wide financial statement that includes all results of governmental operation, accounts, and associated activities | • Efficiency<br>• Transparency<br>• Accountability<br>• Access to information |
| **Paperwork Reduction Act** | 1995 | 104th | 104-13 | • Amendment to Paperwork Reduction Act of 1980<br>• Confirmed that the OIRA's (Office of Information and Regulatory Affairs) authority extended to agency orders that provide information the government, and also to the public<br>• Minimize paperwork burden "for individuals, small businesses, educational and nonprofit institutions, federal contractors, state, local and tribal governments, and other persons resulting from the collection of information by or for the federal government"<br>• Ensure the greatest public benefit from information "created, collected, maintained, used, shared and disseminated by or for the federal government" and that such standards conform to the laws regarding (1) privacy and confidentiality, (2) security of information, (3) access to information | • Cost savings<br>• Transparency<br>• Efficiency<br>• Performance<br>• Privacy<br>• Security<br>• Accountability<br>• Public access to technology<br>• Access to information |

**E-Government Policy and Legislation: A Chronological Timeline, Table 2** (continued)

| IT law | Year | Congress number | Law number | Purpose | Focus |
|---|---|---|---|---|---|
| | | | | • Lay out a plan for schools, libraries, and hospitals to have Internet access by 2000 for learning purposes | |
| **Personal Responsibility and Work Opportunity Reconciliation Act (PRWORA)** | 1996 | 104th | 104-193 | • Provide a mandate for social services to test e-government applications in the field for laws purposes | • Technological superiority<br>• Efficiency |
| **Electronic Freedom of Information Act Amendments** | 1996 | 104th | 104-231 | • Amendment to the Freedom of Information Act of 1966<br>• Ensure that agencies make all information stated in previous laws available by computer telecommunication or by other means electronically<br>• Ensure that agencies provide electronic reading rooms for citizens who do not have access electronically | • Transparency<br>• Public access to technology<br>• Access to information |
| **Government Paperwork Elimination Act** | 1998 | 105th | 105-277 | • Amendment to the Government Paperwork Elimination Act of 1980 and 1995<br>• Ensure agencies use electronic forms, electronic filing, and electronic signatures to conduct official business by 2003<br>• Allow individuals access to and interaction in line with previous tenets of the law electronically<br>• Ensure that all electronic records are not denied legal effect, validity, or enforceability due to their electronic form | • Cost savings<br>• Efficiency<br>• Privacy<br>• Transparency<br>• Access to information |

Telecommunications Act was the first attempt at the government's regulation of certain content on the Internet. The Clinger-Cohen Act also focused on integration of government services with IT and strategic planning goals that set the process in motion to maximize benefits of IT in government. The legislation was also characterized by forward thinking in regard to e-government integration and implementation.

## The Bush Administration (2000–2008)

The noticeable lack of security and privacy legislation during the Clinton years is addressed largely during the Bush years as the events of 9/11 along with an increased recognition of the vulnerabilities of newly integrated technological systems were starting to be more fully understood. As Table 3 shows, during the Bush administration, the USA PATRIOT Act and Homeland Security Act outlined limitations of privacy protections in national security and defense. The latter Act also established the Department of Homeland Security (DHS), with the agency having an active umbrella of cyber security as one of its main goals.

The emphasis extended as well to interagency and international cooperatives as lone wolf and

State sponsored cyber aggressions became a more prevalent occurrence. The Federal Information Security Management Act (FISMA) and Cyber Security Research and Development Act promoted collaboration for developing cybersecurity measures and enhancing IT capabilities.

Still, the focus did not shift away from technological integration but instead expanded upon Clinton Era efforts, with an increased focus on security and privacy. The E-Government Act of 2002 was perhaps the most highly influential law for federal e-government management. It promoted technological superiority and proliferation via tenets of successful e-governance (e.g., privacy, security, efficiency, performance management, and cost savings). It promoted IT and interagency collaboration that would enhance IT efforts in a horizontal fashion, with departments collaborating to bring about more effective e-government services.

The Bush era is represented by an expansion on Clinton era efforts to improve processes through e-government, but with an increased emphasis on the security of such systems and limiting vulnerabilities presented by the new technologies. This dialogue dominated legislation during the era as the nation recoiled from both a major physical terrorist attack in the form of 9/11, but also increased cyber aggression that lawmakers began to see as vulnerabilities to ever increasing e-government systems.

## Obama Administration Focus (2008–2016)

During the Obama administration, the focus continued on IT security as systems capabilities continued to grow and with them vulnerabilities, as shown in Table 4. Congress and the Obama administration also emphasized national/IT security and promoted cooperation/technological development to minimize cyber threats. Privacy in regard to IT was somewhat impacted as the Patriot Sunsets Extension Act contained many surveillance provisions from the USA Patriot Act passed during the previous Bush administration. However, the USA Freedom Act was an amended version of the expired Patriot Act and limited surveillance to specific threats, in order to increase privacy and limit the authority of the

**E-Government Policy and Legislation: A Chronological Timeline, Table 4** Obama era E-government laws

| **USA Freedom Act** | 2015 | 114th | 114-23 | • Restore and modify provisions of the Patriot Act<br>• Impose further limits on the bulk collection of data on US citizens by intelligence agencies | • Privacy<br>• Security |

(continued)

E

**E-Government Policy and Legislation: A Chronological Timeline, Table 4** (continued)

| IT law | Year | Congress number | Law number | Purpose | Focus |
|---|---|---|---|---|---|
| | | | | • Continue extensions for roving wiretaps and tracking lone wolf terrorists | |
| **FOIA Improvement Act** | 2016 | 114th | 114-185 | • Further extend and clarify access of the public to government records<br>• Ensure requesters do not need to show need or reason to request such information<br>• Ensure that records requested 3 or more times must be made available for public record | • Access to information<br>• Transparency |
| **The Federal Cybersecurity Workforce Assessment Act (Act contained in the Consolidated Appropriations Act)** | 2016 | 114th | 114-123 | • Continue to improve workforce development in cyber security efforts<br>• Increase certification in cyber security training among agency staff and addressing gaps that aren't addressed in such training<br>• Identify critical areas of need in the cyber related civilian workforce | • Security<br>• Collaboration |
| **American Innovation and Competitiveness Act** | 2016 | 114th | 114-389 | • Primarily invest in innovation through research and development in order to improve the competitiveness of the United States<br>• Reduce administrative burdens for researchers<br>• Advance public private partnerships<br>• Enhance agency oversight<br>• Promote science, technology, engineering, and math (STEM) education | • Technology superiority<br>• Collaboration<br>• Accountability |
| **United States-Israel Advanced Research Partnership Act** | 2016 | 114th | 114-827 | • Allow the USA and Israel to cooperate on cybersecurity technologies research and development | • Security |

government to only certain instances in its surveillance efforts.

Further, the National Cybersecurity Protection Act of 2014 aimed to combat cyber threats/terrorism by amending the Homeland Security Act and encourage interagency collaboration and ensure the DHS to conduct regular audits that address cyber security vulnerabilities. The law continued to promote public-private partnerships/collaborative efforts that commenced in the Bush administration. The Consolidated Appropriations Act of 2016 contained the Federal Cybersecurity Workforce Assessment Act of 2015. The latter act was also codified into training procedures and accountability measures for cyber threats among government employees.

Collaboration took on a central role as already mentioned, as legislators saw increased cyber aggression as a major threat to existing e-government systems. Furthermore, interagency collaboration addressed these threats and also addressed shortcomings in processes associated with e-government systems. The American Innovation and Competitiveness Act (AICA) was enacted during the end of Obama's term, and it increased nationwide collaboration and IT development efforts. The law's goal was to bring the USA to the forefront in technological development, particularly via investments in research and IT. Furthermore, the FOIA continued to increase transparency by expanding citizens' access to government records. The goal then became technological dominance through public-private partnerships, with an emphasis on privacy and security.

## Conclusion

E-government efforts continued to evolve over decades and began to become more sophisticated with each administration. The early years were highlighted by a focus on surveillance and security, as well as increased efficiency in processes made possible by new technologies. The Clinton administration in 1992 first realized the transformative aspect of e-government and its potential in making citizens more informed and technology more accessible. However, the priorities shifted during the Bush years as increased security needs and vulnerabilities of existing cyber security systems began to dominate discussions. The Obama administration continued the efforts of the Bush administration, while also focusing on effectively increasing e-government efforts through public and private collaborations.

Each era was dominated by a specific law that outlined the purpose of the administration; however, they were also not exclusive in their e-government focus. The Clinton administration's focus on technology centric processes was juxtaposed with efforts to increase access for the public to information and improve internal government processes. The Bush administration's passage of the E-Government Act represented sweeping legislation in enhancing e-government use throughout the nation. The Obama administration prioritized interagency collaboration and innovation, as well as increased transparency and open government. With technology continuing to take on an enhanced role and e-government increasing at the federal, state, and local levels, the need for legislations that address various tenets of e-government including security, transparency, privacy, interagency collaboration, accountability, and overall effectiveness continues to be necessary. This entry presents a timeline of important federal level IT legislation and their purpose and focus and discusses their significance in guiding the implementation and use of e-government and emerging technologies.

E

# E-Government Procurement (e-GP)

Rajesh K. Shakya
The World Bank, Washington, DC, USA

## Synonyms

Digital procurement; e-Bidding; e-Procurement; e-Public Procurement; e-Tendering; G2B; Online procurement; Public e-Procurement

## Definition

An e-Government Procurement (e-GP) is the collaborative use of information and communications technologies by government agencies, bidding community, regulatory and oversight agencies, other supporting service providers, and civil society in conducting ethical procurement activities of the government procurement process cycle for the procurement of goods, works, and services, and management of contracts ensuring good governance and value for money in public procurement, and contributing to the socioeconomic development of country (Shakya 2015, p. 141).

## Introduction

e-Procurement concept is not entirely new. In fact during the 1990s, a new trend of limited automation within the organizational processes as well as the communications with the suppliers in relation to purchase requests and supplies started using Electronic Data Interchange (EDI) systems. As the Internet became accessible within both public and private sectors, there followed a gradual development and use of online tools for the automation of business processes, which also led to the appearance of a number of web-based Business-to-Business (B2B) e-commerce sites and platforms. Inadequate Internet bandwidth available at the time and concerns around the security of ecommerce were the key challenges for these early solutions.

Internet bandwidth is not a challenge anymore, but the cost of bandwidth varies significantly country to country. Today the situation is significantly improved, web-based technologies are matured, choices of state-of-the art-data and network securities are available, and this digital environment is facilitating easy implementation and uptake of electronic services. Digital technologies can be fully leveraged for enhancing public services including, among other public services, public procurement through the implementation of a comprehensive e-Government Procurement system and can deliver tangible benefits to the government, private sector, and citizens.

## What Is e-Government Procurement (e-GP)?

According to the World Bank (2003), e-GP is defined as "the use of information technology (especially the internet) by governments in conducting their procurement relationships with suppliers for the procurement of works, goods, and consultancy services required by the public sector."

The European Union (EU) offers a similar definition, specifically distinguishing procurement by "government institutions and other public sector organizations" (European Commission 2004).

Shakya (2015) has given a comprehensive definition of e-Government Procurement that covers the modern spirit of implementing e-GP:

> An e-Government Procurement (e-GP) is the collaborative use of information and communications technologies by government agencies, bidding community, regulatory and oversight agencies, other supporting service providers, and civil society in conducting ethical procurement activities of the government procurement process cycle for the procurement of goods, works and services, and management of contracts ensuring good governance and value-for-money in public procurement, and contributing to the socioeconomic development of country (p. 141).

The handling of all procurement processes cycle, fully electronic and integrated, is called an end-to-end e-procurement. Implementation of a full-fledged e-GP system is a transformational initiative that cuts across the entire government agencies, supplier community, regulatory and oversight agencies, other supporting service providers, and civil society. Making the shift from manual environment of public procurement to electronic environment requires a well-planned and sustained effort. Government officials and suppliers will have varying levels of maturity when it comes to using IT systems; training is therefore necessary so they can become adept in using e-GP systems. Legislative facilitation has to be made to enable e-GP. Computers and Internet connectivity in government agencies have to be made available and helpdesks have to be established to support users of e-GP. In short, solutions have to be designed to address business, functional, technological, and administrative challenges associated with e-GP implementation.

## International Best Practices in the Implementation of e-Government Procurement

More than 100 countries already implemented e-GP systems and a few countries have yet to take even the initial steps. Existing e-GP systems

implemented in different countries are at various levels of maturity. International best practices entail the following key significance key significance for the successful implementation of the e-Procurement platform:

- The e-Procurement platform is implemented as unitary centralized system, but the Procuring Entities (PEs) carry out their procurement transactions in decentralized way and independently on the platform following prevalent law and regulations and circulars.
- The e-GP System is configured with the provisions available in acts and regulations to make most of those requirements automatically compliant while carrying out the e-GP transactions.
- The e-Procurement system provides a single collaboration platform among the legislative, regulatory and oversight agencies, public procurement entities, bidders, and civil society to carry out all kinds of procurement related transactions and execute their given mandates under the authority and role-based workflow enhancing accountability across the process through automated notification and time-stamped audit trails.
- All stakeholders must get registered into the e-GP system as users with different roles, and each of users get their private workspace or dashboard to carry out procurement transactions under the defined workflow of each of the organizations based on the authority given and configured in the system for them.
- Non-PKI-based authentication is preferred alternative to PKI-based authentication because of the complexity of PKI-based authentication management for national and international bidders.
- E-GP systems are compliant to the Multilateral Development Banks (MDB) e-Procurement Guidelines. Development banks also use the e-Procurement system as user to monitor the project progress and carry out review process through the system.
- Open contracting Data Standard (OCDS) and Geotagging are built in the e-Procurement System.

Early implementations of e-Procurement were mostly limited to few functions and processes. Based on the experience and lessons learned from the success and failure in different countries, end-to-end system implementations are preferred. Some countries have implemented advanced, fully integrated end-to-end e-GP systems, others e-Procurement systems with limited functionalities and processes. Countries such as South Korea, Bangladesh, Georgia, Zambia, and a handful of other countries have implemented full-fledged end-to-end e-GP. e-Procurement systems cover end-to-end procurement cycle (see Fig. 1) for all the public organizations to goods, works, and services using all procurement processes, and practices through all procurement methods (quotation, direct, open competitive, restrictive, single and multistage, framework agreement and auctions) from national and international proposers leveraging the innovative functions and tools to address all aspects of good governance (i.e., transparency, accountability, efficiency and effectiveness, corruption control, equity and ethics, rule of law and predictability, and civil society awareness) through electronic environment.

An end-to-end e-GP system generally covers the following functions and tools in addition to other supporting features:

(a) e-GP portal and module for the information publication based on open contracting data standards (OCDS) and geotagging
(b) Registration for bidders and PDE users
(c) User-specific administrative dashboards
(d) e-Bidding (covering procurement and disposal methods supported by public procurement law and regulations; from Annual Procurement Plan to signing of contract)
(e) e-Auction
(f) Contract management with contractor performance appraisal and management
(g) Framework agreements and their management
(h) e-Payments and guarantees
(i) Administrative reviews (Complaints management)
(j) e-Catalog

(k) e-Authentication and authorization functionality
(l) Workflow management and audit trails
(m) Risk-aware indicator based e-Procurement Management Information System (e-PMIS)
(n) Interface to Financial Management Information System (FMIS), business registration systems, and e-Tax
(o) Online help and video tutorials

Countries, such as Canada, USA, Chile, Indonesia, Malaysia, Mexico, the Philippines, and Portugal, have applied e-GP systems for more than a decade, and they are now used extensively by a large number of procurement entities, with scope for further enhancements.

## Strategic Objectives of e-Government Procurement

In terms of e-commerce, e-procurement is usually the e-Government Procurement (e-GP), or e-procurement, is more than just a government website on the Internet to publish information about the procurement opportunities and other related information. The strategic objectives of the e-Procurement (see Fig. 2) are enhancing good governance, achieving value-for-money, and contributing to socio-economic development leveraging information and communication technologies in the country (Shakya 2015). The e-procurement supports and simplifies the public procurement processes for all stakeholders involved in public procurement: public/procuring entities, suppliers from business, oversight and regulatory authorities, and citizens. The use of the e-procurement system can connect all stakeholders and support processes for online procurement transactions and other related activities. In other words, e-GP supports and stimulates good governance. Therefore, the objectives of e-procurement run parallel to the objectives of good governance in public procurement. Implementation of e-procurement system for the good governance can be seen as an exercise of

**E-Government Procurement (e-GP), Fig. 2** Objectives of e-Government procurement (Copyright 2015 by R. K. Shakya)

economic, political, and administrative authority to better manage the public procurement sector in the electronic environment.

The strategic importance of procurement has been reiterated frequently. The level of coordinated incorporation, integration of public procurement, and different dimensions of good governance in process and practices of the e-procurement system development and implementation influence the role of e-procurement in enhancing good governance. However, having all the best practices and dimensions of good governance in a single system may require considerable understanding of the principles of good governance in public procurement.

According to Arrowsmith et al. (n.d.), the last decade of the twentieth century witnessed the start of a global revolution in the regulation of public procurement. Actually, challenges in procurement reforms are beyond procurement regulations to include procurement process, methods, procurement organizational structure, and workforce. According to Thai (2001), procurement reforms occur constantly in all countries, developed as well as developing countries. The purpose and scope of reforms may vary from country to country depending on the problems in the country, but fundamental principles of procurement are in general same either that is in the developing country or in the developed country. The evolution of procurement is ongoing, from bureaucratic, manual process, green procurement to e-procurement systems. Therefore, the efforts have been made for the reform activities for the good governance in key sectors.

## Challenges in Traditional Procurement Environment

Government procures goods, works, and services to meet the policy outcomes as well as carry out operational activities. In some cases, it is obvious that a particular procurement is directly associated with the development policies, but in other cases the procurements may facilitate indirectly. Whether the procurement is strategic for policy outcome or it facilitates regular operational activities, government procuring organizations must adhere to government procurement policy, spirit of acts, and regulation through a fair and transparent procurement process, adhering to the principles of procurement good governance and value for money on spending public funds (Shakya 2016a).

In traditional paper-based procurement environment or ad hoc technology-based procurement

systems, ensuring the adherence to the government policy, procurement acts, regulations, guidelines, and principles of good governance by all of its government procuring organizations consistently and due diligently is not easy, and monitoring their compliance and procurement performance are not realistically possible. Traditional procurement environments are challenged by processes with loopholes, officials given authorities to sanction procurements and contracts without having effective system of accountability, and undocumented practices. It is not easy to establish structures, processes, and monitoring system ensuring the desired practices because of paper-based work culture, fragmented processes, scattered authorities and inconsistent standards in procurement documents and practices, and enforcement complexities. Traditional procurement environment are prone to numerous compromises with the legislative, procedural, operational, and ethical behavioral requirements, which spans the whole life cycle, from the identification of the need to procurement, through supplier selection and contracting, to the delivery of the required goods or services and (where relevant) the underlying policy outcome through to the disposal of the asset(s) or service closure or recompetition exercise.

The implementation of e-procurement has been considered one of the most promising and feasible options for addressing challenges faced in the traditional procurement environment, and facilitates the governments in rendering enhanced governance in the acquisition of goods, works, and services for the public sector.

## e-Procurement as an Ideal Environment for Public Procurement

There are different forms of e-Procurement implementations around the world that ranges from simple email-based bidding document sharing and bid submission to selected process automation to comprehensive end-to-end e-Procurement systems covering complete processes of procurement life cycle. Very few of the e-Procurement systems can be found implemented with full fundamental functionalities, and considering all the aspects of the good governance principles of public procurement. Fragmented and ad hoc implementation of e-GP system only engenders inefficiencies, complexities in workplace, and frustrations to users and policy makers, as well as providing new options of corruptive practices and creates challenges in accountability chain. The e-procurement system implementation covering only partial or fragmented set of procurement functions may be inefficient and ineffective. This approach is not favorable for achieving desired objectives of public procurement (Shakya 2016a).

According to Matthews (2005), vulnerability discovered from the traditional procurement system has led to the development of e-Procurement in the governments. The issue about public accountability of conventional procurement process also becomes an ethical issue. Whereas the procurement of goods and services is the most significant activity of the government, not only in terms of the amount of activity but also the funds allocated (Moon 2005).

Most of the governments around the world are implementing the e-GP systems as a tool for public procurement reform for better governance in this sector. e-Procurement as an innovative tool for reform in public procurement sector is required to be adopted by its stakeholders, mainly by the procuring agencies, bidders, and regulatory/oversight agencies. The introduction of the e-GP system is expected to enhance the good governance, achieve better value for money in the public procurement sector, and support the socioeconomic development of the country. e-Procurement has proven itself to be one of the more effective and efficient tools for bringing good governance to the procurement process in many countries (Shakya 2012).

Also as a result, the implementation of the e-GP system is expected to improve transparency in the procurement process; ensure accountability, rule of law, equity, and competitiveness; improve corruption control; and increase civil society awareness in regard to the public procurement. Success of the e-GP implementation depends on numerous interdependent factors and processes,

which are sometimes ignored or not considered by the implementers during its planning and implementation process. If properly designed and implemented with strong determination of the leadership for the public procurement reform, e-Procurement environment can be significantly a better platform for public procurement, which can strictly implement and enhance all the aspects of the procurement good governance principles and the environment set by the legislative framework without any compromise on ethics and accountability and with enhanced transparency, efficiency, and effectiveness collaborating with all of its stakeholders including the tax payer citizens.

## Benefits of e-Government Procurement

e-GP has a range of potential benefits, and the procurement of goods, works, and services through e-procurement is emerging worldwide with the potential to reform processes, improve market access, and promote governance in public procurement. However, rather than a technical solution, e-procurement should be considered as a mainstream platform for the public procurement in general. Perceived benefits of implementing e-GP System are:

- Improved overall procurement efficiency
- Streamlined procurement processes
- Shorter procurement processing time
- Simplified and transparent procurement processes
- Faster procurement cycle times
- Ensured accountability
- Corruption control
- Increased competition from bidders
- Equal opportunity for small to large bidders help to level the playing field
- Enhanced public awareness on the expenditure of public fund
- Lower procurement prices
- Reduced order times
- Improved compliance with procurement legislation and rules
- Improved contract management
- Improved information management and procurement analytics
- Significant administrative savings
- Easy implementation of decentralized procurement and performance monitoring
- Informed procurements and policy decisions

It is clear that the business case for e-GP should include a range of qualitative and quantitative aspects (see Table 1).

The above discussion establishes the benefits of a well-conceived, competently implemented e-GP strategy. Benefits have been described in qualitative and quantitative terms. The qualitative benefits are not readily measurable; however the reported quantitative results include savings ranging between 5% and 20%. With public procurement accounting for between 15% and 20% of the national economy, this level of savings potential is substantial and the benefit/cost ratio should be overwhelming even without considering the qualitative benefits.

Malpractice, a flawed strategy, or poor management in the development and implementation of e-GP can show negative impact.

## Conclusion

This entry has provided an overview about e-Government Procurement (e-GP), and the role that it plays in enhancing public procurement sector. It began with a discussion of e-GP background and evolution of definitions. The author presents a comprehensive definition of e-Government Procurement (e-GP) covering the core principles of public procurement, good governance, and modern spirit of implementing e-GP. Implementation of e-GP continues to advance across the world. Next, the entry provides a discussion on the international best practices in implementing e-GP and its coverage.

This entry also discussed strategic objectives of the e-Procurement, challenges in the traditional procurement environment, and discusses how e-Procurement can resolve those challenges. Finally, the entry discusses the benefits of e-GP and factors of e-GP impact assessment.

**E-Government Procurement (e-GP), Table 1** Factors for e-Procurement impact assessment

| No. | Factor | e-Procurement impact | Direct stakeholders |
|---|---|---|---|
| 1 | Prices | Reduced 5–8% in competitive markets | Ministry of finance, departments |
| 2 | Transactional efficiency | Reduced 65% for simple procurement | Suppliers, departments |
| 3 | Procurement cycle times | Reduced 25–75% for complex procurement<br>Reduced 80–95% for simple procurement | Departments, communities |
| 4 | Compliance | As for maverick buying 30% | Departments, public procurement authority |
| 5 | Delegation control/ decentralization | Up to 100% simple procurement | Departments, civil society |
| 6 | Transparency/illicit practices | Substantial reduction reported | Public procurement authority, attorney general, departments |
| 7 | Spend coordination X maverick buying | Increased 30% | Budgets, departments |
| 8 | Audit capacity | 100% for parts of procurement cycle | Attorney general, public procurement authority |
| 9 | SME/business development | Online business enablement 25% | Business development, suppliers |
| 10 | Inventory value | Reduced 70% | Budgets, centralized procurements, centralized medical stores, departments |
| 11 | Training requirements | Reduced for common functions | All stakeholders |

## Synonyms

Convergence governance; E-government: Digital government; Intelligent government; Network governance; Online government; Smart E-governance: Connected governance

## Definitions

| | |
|---|---|
| Smart | The term "smart" originally comes from the acronym "Self-Monitoring, Analysis, and Reporting Technology" but smart technology goes beyond just the normal sending and receiving of information and the traditional turning things on and off. Instead, it offers the people much more interaction and control, which is always connected, through the use of the Internet, smart phones, smart cars, Internet of Things (IoT), and other smart devices. It implies both the device and network connectivity. |
| Smart E-governance | A highly intelligent governance system that redesigns existing administrative practices and procedures based on the smart technologies and social networks, and enables government and businesses, citizens, and local communities to share knowledge and information. It is also a governance system that aims to serve as a cooperative partner by providing a platform for public relations that helps social actors to generate productive and democratic added value through mutual transactions among the community people. |

## Introduction

The current smart society suggests the beginning of a post-information society which is beyond the technology-driven and system building initiatives during the information society. Government-driven ICTs policies could not pull out individuals' creative ideas and thoughts in the stage of agenda setting and decision-making cycles. A smart society more focuses on the deliberation process of agreement among governments, citizen, and private sector organizations through the advanced ICTs and social media.

The government now should carefully listen to the people's opinion and quickly respond to the demand of various stakeholders. The government in a smart society must have the capability of multi players like politician, public officials, and mediator of the social conflict agendas under the cross-checking mechanisms enabling people's use of smart technologies. Information asymmetry between government policy initiatives and policy implementations cannot be allowed in this hyper-connected society in which people get information more quickly through a variety of information resource channels then the blocked government built in the period of e-government building which has worked somewhat efficiently enough in a silo and centralized data management environments. Unfortunately, many governments including Korean government mistakenly believe that e-government services will work again in a smart society and eventually have failed to transform their e-government into e-governance and smart e-governance.

The purpose of this chapter is to discuss the paradigm of e-government by introducing a smart e-governance perspective. Firstly, it looks at the

history and success factors of e-government building in Korea. Secondly, it discusses a paradigm shift from e-government to smart e-governance based on a contingency theory. And finally, a new perspective based on smart e-governance is introduced which entails both consensus processes and effective implementation of balancing democracy and efficiency in the fourth industrial revolution.

## Brief History and Success Factors of E-Government in Korea

Korea has strategically planned and implemented policies for building ICT infrastructure and e-government systems from the 1980s. Korea has become as one of the world's best countries for ICT and e-government, ranking it at the top of the United Nations E-Government survey done in 2010, 2012, and 2014.

The Table 1 shows the government-driven e-government initiatives and ICT policies which have seldom been found in other competing nations. Particularly, the 11 e-government initiatives of Kim Dae-Jung's government (1998–2002) was a citizen-centered e-government by which citizens can access to online applications for government services without redundant processes and documentations. The Roh Moo-Hyeon's government (2003–2007) has more focused on integration of government portals and citizen participation by carrying out 31 roadmap projects for E-government as well as laying the groundwork for linking and integrating multiple government departments and agencies.

**E-Government to Smart E-Governance: Korean Experience and Challenges, Table 1** Development stages of E-government in Korea

| Stages | Major Actions |
|---|---|
| Inception (mid 1980s~mid 1990s) | Building five National Basic Information Systems (NBIS)<br>Act on Computer Network Expansion and Usage Promotion (1987) |
| Foundation (mid 1990s~2000) | Building foundation for high-speed information and communications and promoting the Internet<br>Enacting the Framework Act on Informatization Promotion (1995) |
| Launch (2001~2002) | Carrying out 11 major initiatives for e-government<br>Enacting the Act on E-Government (2001) |
| Diffusion (2003~2007) | Carrying out 31 roadmap projects for E-government<br>Laying the groundwork for linking and integrating multiple government departments and agencies |

| Smart Government (2011~present) | Initiating the future e-Government blueprint, Smart Government (2011~2015) |

Note: Source: MOSPA (2013a: 6)

The success factors in Korean e-government building are analyzed as a strong government leadership, aggressive investment based on clear goal-setting, effective informatization governance framework and structure (MOSPA 2013b: 16–17). Firstly, the Korean government established a supervising and coordinating body in the area of informatization policies under the strong president's leadership to oversee and manage the process. For example, "Invest first, settle later method" supported by laws including the Act on Computer Network Expansion and Usage Promotion (1987), the Information Infrastructure Protection Act (2001), Informatization Promotion Framework Act (1995), and the Electronic Government Act (2001) is an example of presidential leadership. Secondly, the government strategy of "choice and focus" was successfully been applied for the construction of the Korean broadband network, the aggressive investments in e-government projects which resulted in the improvement administrative efficiency and quality of citizens' life. Thirdly, an informatization governance framework was established for mutual benefit and cooperation between the public and private sectors. Experts in the private sector played important roles in overseeing, coordinating,

reviewing, and advising organizations on informatization policy and e-government projects.

## Contingency Model of E-Government

Contingency approaches provide more flexible perspectives to IT management and e-government studies. This is especially useful for the study of ICT management in government organizations because there is greater interdependency within and between departments or higher levels of governments, more accountability to the public. For example, "reinforcement politics" theory (Kraemer 1990, p. 530) argues that decision-making power over the ICT use varies from setting to dominance of particular groups contingent on the local political system and its specific configuration of dominant of values, interests, and actors.

Contingency model of e-government is shown in Fig. 1. The vertical axis (e-government for what) indicates the objective values for building e-government, which include efficiency or productivity, transparency, and power. The horizontal axis (e-government for whom) indicates the target of e-government systems and services whether it is citizen-oriented or designed for the sake of government itself. The contingency model of e-government shows how the e-government changes according to the shifting social paradigm and political environments, which can be classified by six types of e-government based on the conceptual model of e-government.

## Industrial Society-Based E-Government (Type I, II) – "Technocratic E-Government and Information Management-Centered E-Government" (Type I, II)

### Technocratic E-Government (Type I)

E-government is in a stage where it has little direct connection with civil society in which citizens participate in the policy decision-making process and is still very exclusive to the external groups of stakeholders while the information is shared among a small number of people in the government. The type of e-government at this stage, then, can be defined as "Technocratic E-government."

| Values \ Target | | E-Government for Whom? | |
|---|---|---|---|
| | | Government/Nation | Citizen |
| E-Gov For What? | Efficiency Productivity | Type I Industrial Society based E-Gov *Technocratic Gov.* | Type II Industrial Society based E-Gov *Info. Management-centered Gov.* |
| | Transparency | Type III Monitoring Gov. | Type IV Information Society E-Gov *Transparent Gov.* |
| | Power | Type V Big Brother Gov. | Type VI Next Generation E-government *Democratic Gov.* |

**E-Government to Smart E-Governance: Korean Experience and Challenges, Fig. 1** Contingency model of e-government. (Note: Source (Myeong 2018: 106))

### Information Management-Centered E-Government (Type II)

E-government in this stage where the level of social pluralism is still fairly low, and the civil society still rather passive should be classified as e-government centered on information disclosure. E-government is applied, in other words, to disclose government-held information to civil society and thereby honor citizens' right to know. The type of e-government also focuses on building information systems based upon the provider-oriented design and structure, then, can be classified as "Information Management-centered E-government."

## Information Society E-Government – "Transparent and Participatory E-Government" (Type IV)

E-government in this stage, where there is an active civil society and considerable progress has been made toward a more pluralistic society, in which citizens find out access channels and begin to express their opinions in government portals. In this stage, the scope of application of e-democracy is extended so that the government takes part in the government's decision-making process but it is still limited to the provider-driven portals. In other words, there is a two-way exchange between the government and citizens. The e-government model in this stage can, then, called "Transparent and Participatory E-government."

## Next Generation E-Government – "Democratic and Governance-Type E-Government" (Type VI)

In this stage of social development, society is highly pluralistic and civil society, which has a capacity of self-governance, is highly active enough to decide the agenda in a local community. E-government in this stage is, therefore, pluralistic e-democracy enabling active e-voting not only between different sections of the government but also between the government and the various sectors of society. An optimal level of democracy and transparency is reached in the government's decision-making process, and the views are exchanged by people from all walks of life through a far and wide-reaching network and platforms. In this stage, e-government systems will finally assume a model adapted for the next-generation society and may be defined as "Democratic and Governance-type E-government." The role of government is now shifting from the role of a "decision-maker" to that of a "coordinator" who gathers the opinions of people from everyday life, serving as a mediator to reconcile differences between interest groups and stakeholders. Meanwhile, the fourth industrial revolution, accompanying the shift in the government's role, is causing a shift also in the service paradigm in the public sector. Convergence of ICT, such as the Internet of things (IoT), artificial intelligence (AI), Big Data, and blockchain sweeping across society has not only assigned a new role to the government, but is also transforming government services, and improving accessibility as well as the overall technology environment and shown in Table 2. It compares the successive models of e-government in Korea in terms of services, accessibility, and technology environment and proposes future strategies. E-government is more system-oriented and has built-in government initiatives in the earlier stages of e-government building in the industrial and information society. E-governance is more about communication-oriented and integrating various stand-alone systems and services between government-to-citizen (G2C), government-to-government (G2G), government-to-employees (G2E), as well as back-office processes and interactions within the entire government framework (Saugata and Masud 2007). Through e-governance, government services are made available to citizens in a more convenient, efficient, and transparent manner. The three main target groups are government, citizens, and businesses/interest groups. In e-governance, there are no distinct boundaries (Garson 2006).

## Next Generation E-Governance: Smart and Platform E-Governance

A smart society focuses on the process of mutual communication and the incorporation of each

**E-Government to Smart E-Governance: Korean Experience and Challenges, Table 2** Evolution and elements of e-government model

| | | Industrial-society e-government | Information-society e-government | Next generation e-government |
|---|---|---|---|---|
| E-government generation | | E-government | E-governance | Smart E-governance |
| Services | | One way service<br>Digitalization of services<br>Limited amounts of information is closed<br>Services subject to temporal and spatial constraints | Intersection of government and private-sector services<br>Creation of new values through new services<br>Two-way information exchange<br>Extended range of information disclosure<br>Mobile services | Personalized and customizable services<br>Proactive, intelligent services<br>Interactive information exchange<br>Real-time information disclosure<br>Uninterrupted supply of services |

individual's thoughts into some social agreement. With the rise of smart society, "smart e-governance," as a new model for e-government, is a system where the government strengthens the cooperative partnership with people and the private sector. Figure 2 shows the change of e-government from e-government to smart e-governance from the perspective of governance including the role of each actor, the goal of e-government services, and the environmental changes to ICT and demand. In the era of smart e-governance, the Internet, and SNS have already established their influence in the most powerful information-sharing media in history, playing immeasurable roles in globalization, in the spread of democracy around the planet, in economic growth, and in education. Democratic and governance-type e-government, based on smart e-governance, constitute the phase in which the main progress consists in enabling active participation by citizens in the affairs of the government and their open communications with it. These systems are expected to upgrade gradually to platform-based systems, espousing the new e-government paradigm for the next-generation smart society.

As ICT develops, e-government evolves and evolves into a form of public information that maximizes accessibility through people-oriented public information, public-private-public cooperation, and information convergence. The future e-government will be transformed into a new government role paradigm, not traditional government intervention, while strengthening the link between government and enterprise. It is possible to define the function of the government that can change the state of the future government as the platform function. We can define the type of future government as follows (Myeong 2011, pp. 77–79).

Firstly, based on the interconnection function of the platform, it *is a cooperative government* as a future platform government functioning centering on the strengthening factors of government-

| | (E-government) | (E-governance) | (Smart E-governance) |
|---|---|---|---|
| **Goal of E-Gov.** | Efficiency of System | Info. Sharing & Connectivity | Open Big Data<br>Individual-oriented Service |
| **E-Gov. Services** | Internal & Info. Provide | Gov. Reform & Single Portal | Platform Based My Gov. Services |
| **Ecology of ICT** | Gov. Driven & Outsourcing | Gov. Driven & Outsourcing | Gov.-Private-Citizen Partnership, Deregulation |

| **Decision Making Initiatives** | Political Elites & Gov. CEO | Gov., Professional, Public Officials | Individuals, Citizen, NGOs |
| **Demand & Method for Decision Making** | Political Needs | Policy Needs | Participation & Communication based on Big Data |
| **Role of Central Government** | Initiator | Contractor | Mediator |
| **Role of Local Government** | Dependent upon Matching Funds<br>System Building | Matching Funds<br>Constructing Local Gov. Portals | Local/Community Demand-based Personalized Services |
| **Role of Entrepreneur** | System Provider | New Tech. & System Application Develop | Convergent Services<br>Creating New Services |
| **Role of Citizen** | Info. Service User | Partly Participation | Active Participation & Voting |
| **Decision Maker** | Top Down Budget Allocation | Policy/Budget Control based on Performance Evaluation | Focusing on Problem Solving<br>Data Analysis & Vision |
| **Demands by Paradigm Shift** | Gov./National Informatization | Gov. Reform<br>Local Autonomy | Cooperative Partnership & E-Governance |

**E-Government to Smart E-Governance: Korean Experience and Challenges, Fig. 2** E-governance perspectives and changes toward smart e-governance. (Note: Source: (Myeong 2018: 224))

citizen-private cooperation. Cooperative governments have the potential to increase the value added of the government to various resources that are generated when citizens and companies access the platform and re-enter the platform mechanism for the re-service and increase social added value. The origin of cooperative governments is correlated with changes in the economic system. The social value has been added to the public sector. Therefore, we create value through mutual cooperation with other private sector entities. In the existing public sector, the government has led many policies to resolve social conflicts and regional balances. However, the private recruitment of the local community and the strengthening of the civil society in the public domain require a partnership relationship with the government.

Secondly, it is *an intelligent government* as a future government functioning to strengthen the more controlled and data-driven administrative services for the people's demands based on the ability to connect and strengthen the existing ones. The intelligent government provides services by constructing an active service system to visit individual citizens and customize the service to accommodate the diversity of the people. The ability to have such a function of activeness, acceptance of diversity, and conflict resolution is possible because the provider and the consumer simultaneously approach the platform.

And thirdly, as a future platform, government functioning centering on cross-checked communication, participation among each individual, and trust based on the value added through the platform, it can be said as a transparent government. *A transparent government* platform provides the basis for transparent mutual transactions through the disclosure and sharing of information, and monitors violators who break this order with

other surveillance systems (individuals, communities, civic groups, international communities, etc.). In other words, the government does not maintain control over the collective information of the people but maintains the government system by providing transparent transaction base and faithfully monitoring. It will be a mediator for a fair game and a referee for securing transparency.

## Conclusion

E-government initiatives in Korea in the period of information society have been quite successful under the paradigm of the New Public Management (NPM). The Korean government introduced a broad range of public sector reforms through e-government initiatives which aimed to provide more customer-oriented services based upon automated administration system and data networks. In the earlier stage of information society, information management-oriented e-government may prevail when the level of social pluralism is still fairly low while the bureaucratic government and system operate more efficiently under the provider-oriented mechanism. When society is highly pluralistic and civil society is highly active, active electronic transactions occur in this stage among various sectors of society and people want to get timely information for engaging with the deliberation focused more on the interests of the general public rather than those of the bureaucratic elite.

In that regard, a new perspective based upon the critical analysis of the fundamental and instrumental means of e-government is necessary to go beyond NPM or post-NPM, which relies heavily on economic and management theories (De Vries and Kim 2011). As Wachhaus (2011) pointed out, an anarchist orientation may adjust the way we look at society. A network is organic rather than mechanical. E-government is already an organic and thus e-government study should not fall in the dichotomy between "science" and "art." Advocates of e-government in the future should take both consensus processes and effective implementation for balancing democracy and efficiency. A new perspective based on a smart e-governance is now required to seriously look at a new position in the fourth industrial revolution, which is a decentralized self-service model in a tightly engaged network and platform.

# E-Government, Accountability, and Performance

Rebecca L. Orelli
Department of Management, University of Bologna, Bologna, Italy

## Synonyms

Accounting; Electronic government; Measurement; Responsibility

## Definition

Definition of e-government: the use of information and communication technologies (ICT) and particularly the Internet, as a tool to achieve better government

## Introduction

Over the past decades, there has been a significant evolution of e-government, an overwhelming evolution of information systems and information technology inspired by different strategies of implementation issued by the different countries over time. While international bodies (United Nations, European Union, OECD, World Bank) have defined strategies and goals which are valid for every member, each country has the freedom to adapt them to its particular social, administrative, and economic context. Therefore, differences arise in terms of span of services provided via e-government, quality of introduction of new information technology tools in governments, and level of e-government achieved, in terms of e-participation, e-democracy, overcoming of the digital divide, and e-inclusion.

Authors have identified different inner elements of e-government. Among others the most important elements can be identified in the accountability and performance. Research has delved into the factors (historical, institutional, legal, organizational, functional, policy, and theoretical background) that inhibit or promote the adoption of ITs systems and e-government in the public sector (Garson 2006). Accountability and performance still remain the scope of any public management reform through the western world (Bouckaert and Pollitt 2005); thus, this must also be the ultimate goal of any e-government initiative.

Many studies have focused on the description of the introduction of e-government under different perspectives (Dunleavy et al. 2006; Hood and Margetts 2007). Then studies have changed focus to clarify extent and direction to which e-government influences accountability and performance.

The extent to which e-government systems influence accountability and performance in the public sector can be judged by considering the achieved results of different countries. This analysis will clarify the influence of e-government as intended by established national strategies on accountability and performance.

## Combining E-Government, Accountability, and Performance

The present section combines the areas of e-government, accountability, and performance in the public sector and examines how closely and critically intertwined they are.

Programs of government do not work by themselves (Miller and Rose 1990); they require "technologies" if they are to be made operable. Technologies are devices for intervening, and they include notation, computation and calculation, procedures of examination and assessment, etc. Today they can be identified also with information technologies. Using the brief discussion above as a starting point, there is a strong case that can be made that e-government should be viewed within the context of an accountability and performance framework in the public sector.

E-government represents the first form of extensive usage of ICT in the public sector, and since mid-1990s it has represented a major concern of public innovation for governments

involved in the implementation of new public management-style reforms (Orelli et al. 2010). The e-government project is defined as "the use of information and communication technologies, and particularly the Internet, as a tool to achieve better government" (OECD 2003, p. 11), and it brings together a set of ideas about using information and a set of instruments for making these operable (Lapsley and Miller 2010).

States have been implementing public sector policies by restructuring government institutions and public organizations, modernizing budgeting processes and rationalizing financial policy and its implementation, and renewing/reviewing public service delivery and public private partnership by using ICT tools with the aim of improving managerial processes and communication with citizens.

As well as any other innovation, e-government requires designers and implementers, and the United Nations, European Union, OECD, and World Bank represent the main actor in achieving the so-called Information Society for All, designed to help governments meet demands for the services they provide to citizens and businesses.

Three dimensions seem to be important when e-government is studied with reference to accountability and performance. The first dimension is the *nature of the accountability relationship* deploying an e-government. In other words, the source of the "account giving" in an IT system may be, according to Romzek and Dubnick (1987), political, legal, bureaucratic, or professional. Each of these sources will have different criteria and sets of data and information they expect from such a system and places different demands on the IT system.

The second dimension is the *level of government and types of external stakeholders* involved. For example, a government website may be developed with the input of a citizen advisory committee. Or different levels of government, for example, local and state governments, may interact with the federal or central government to shape government system deployment. In other words, actors that shape the concept of performance that has to be provided by e-government (Heeks 2006).

The *types of performance* for which e-government is intended to accomplish represent the third dimension. E-government offers different services or information to citizens, other governments, contractors, or internal managers via the IT system. Each group will of course bring their own demands of output on the system (Poister 2003). Website or e-government information could include items such as how the government is structured, how laws are passed, and other basic government information. Overall, e-government implementation strategies may be focused more on efficiency gains (producing the same outputs at lower total cost, producing more outputs at the same total cost, or producing the same outputs at the same total cost in less time) and effectiveness gains (producing the same outputs at the same total cost in the same time, but to a higher-quality standard, or producing new outputs) (Hammers Specht and Hoff 2005; Reddick and Frank 2007).

All three of these dimensions described can be used to categorize the strategies adapted in to link e-government, accountability, and performance.

## Linkage Among E-Government, Accountability, and Performance

According to present e-government main policy strategies (United Nations E-Government Survey 2014), e-government requires new connections with accountability and performance as a prerequisite for development and in order to match declared strategies.

The Information Society Project was set in motion in the early 1990s inspired by two factors. First, the US National Information Infrastructure Initiative (NIII), introduced in the early 1990s, had a direct impact on many countries and international organizations (United Nations 2002, 2014). The guiding principles of the NIII provided a model for subsequent initiatives expressed in such documents as the Bangemann report and e-Europe (European Commission 1994). Another factor was the assumed potential of new information and communication technologies. By 1993 the US and EU were ready to construct a new

agenda and meet the challenge of the emerging information age. At present the initiatives in the field of e-government are embedded in national or supranational strategy for growth.

There are strong linkages between e-government, accountability, and performance. The United Nations General Assembly in its resolution "The Future We Want" reaffirmed the need to achieve sustainable development by promoting sustained, inclusive, and equitable economic growth. It stressed that all levels of government and legislative bodies play an important role in promoting sustainability. Overall, "sustainable development emphasizes a holistic, equitable and far-sighted approach in decision-making at all levels. It rests on integration and a balanced consideration of social, economic and environmental goals and objectives in both public and private decision-making. It emphasizes intragenerational and intergenerational equity" (E/2013/69, para. 6).

It is clear that all governments are faced with a set of complex, multifaceted, and interdependent challenges. Effective collaboration among government at all levels is essential, as it is with nongovernmental actors, to ensure good and collaborative governance.

E-government and innovation can provide significant opportunities to transform public administration into an instrument of accountability. E-government is "the use of ICT and its application by the government for the provision of information and public services to the people" (UN Global E-government Readiness Report 2005). More broadly, e-government can be referred to as the use and application of information technologies in public administration to integrate workflows and processes and enable performance measurement, to effectively manage and measure data and information, to enhance public service delivery, as well as to expand engagement of people under a holistic and multistakeholder approach.

Through e-government, public administrations around the world can be more efficient, provide better services, and respond to demands for accountability and performance within and among countries.

## Analysis

In 2001 the United Nations assessed for the first time the global e-government development through the "Benchmarking E-government: Assessing the United Nations Member States." Since then, there has been increasing evidence through public policy formulation and implementation that e-government has played an effective enabling role in advancing national development.

At present the main tool to monitor the development of e-government, based on specific indicators, is represented by the United Nations E-Government Survey (2014). The biennial edition of the survey aims to exemplify successful e-government strategies, pioneering practices with a view toward administrative reform, and sustainable development.

The conceptual framework of the E-Government Development Index (EGDI) remains unchanged since its inception in 2001. The EGDI is a composite measure of three important dimensions of e-government, namely, provision of online services, telecommunication connectivity, and human capacity.

Twenty-five countries have a "very-high EGDI" with index values in the range of 0.75–1.00 (see Fig. 1). The regional representation mirrors a majority of 64% (16 countries) from Europe, 20% (5 countries) from Asia, 8% (2 countries) from Americas, and 8% (2 countries) from Oceania. All top 25 are high-income nations, as defined by the 2012 World Bank country classification. The Republic of Korea has retained the top spot in 2014 with its continued leadership and focus on e-government innovation. Australia (2nd) and Singapore (3rd) have both improved their rankings considerably over their 2012 performance.

One of the primary factors contributing to a high level of e-government development is concurrent past and present investment in telecommunication, human capital, and provision of online services.

Figure 2 shows the breakdown of countries grouped by EGDI. While there are only 25 countries (13%) ranked as very-high EGDI, the majority falls in the middle range, with 62 countries (32%) ranked as high EGDI and 74 countries

| Country | Region | 2014 EGDI | 2014 Rank | 2012 Rank | Change in Rank (2012–2014) |
|---|---|---|---|---|---|
| Republic of Korea | Asia | 0.9462 | 1 | 1 | - |
| Australia | Oceania | 0.9103 | 2 | 12 | ↑ 10 |
| Singapore | Asia | 0.9076 | 3 | 10 | ↑ 7 |
| France | Europe | 0.8938 | 4 | 6 | ↑ 2 |
| Netherlands | Europe | 0.8897 | 5 | 2 | ↓ 3 |
| Japan | Asia | 0.8874 | 6 | 18 | ↑ 12 |
| United States of America | Americas | 0.8748 | 7 | 5 | ↓ 2 |
| United Kingdom | Europe | 0.8695 | 8 | 3 | ↓ 5 |
| New Zealand | Oceania | 0.8644 | 9 | 13 | ↑ 4 |
| Finland | Europe | 0.8449 | 10 | 9 | ↓ 1 |
| Canada | Americas | 0.8418 | 11 | 11 | - |
| Spain | Europe | 0.8410 | 12 | 23 | ↑ 11 |
| Norway | Europe | 0.8357 | 13 | 8 | ↓ 5 |
| Sweden | Europe | 0.8225 | 14 | 7 | ↓ 7 |
| Estonia | Europe | 0.8180 | 15 | 20 | ↑ 5 |
| Denmark | Europe | 0.8162 | 16 | 4 | ↓ 12 |
| Israel | Asia | 0.8162 | 17 | 16 | ↓ 1 |
| Bahrain | Asia | 0.8089 | 18 | 36 | ↑ 18 |
| Iceland | Europe | 0.7970 | 19 | 22 | ↑ 3 |
| Austria | Europe | 0.7912 | 20 | 21 | ↑ 1 |
| Germany | Europe | 0.7864 | 21 | 17 | ↓ 4 |
| Ireland | Europe | 0.7810 | 22 | 34 | ↑ 12 |
| Italy | Europe | 0.7593 | 23 | 32 | ↑ 9 |
| Luxembourg | Europe | 0.7591 | 24 | 19 | ↓ 5 |
| Belgium | Europe | 0.7564 | 25 | 24 | ↓ 1 |
| Very High EGDI Average | | 0.8368 | | | |
| World Average | | 0.4712 | | | |

**E-Government, Accountability, and Performance, Fig. 1** World e-government leaders (very-high EGDI) in 2014. (Source: E-Government Global Survey 2014, p. 15)

(38%) ranked as middle EGDI. The lowest performing group, ranked as low EGDI, consists of 32 countries (17%).

## Conclusion

The United Nations E-Government 2014 Survey highlights that effective e-government development depends on strong political will, collaborative leadership, and new governance frameworks to support and manage a citizen-centric service delivery model, including a national ICT policy and e-government strategy, as well as strengthening institutions and building the capacities of public servants. Commitments to collaboration, openness, transparency, accountability, and participation in national public governance, backed by robust ICT

| *Very High EGDI (More than 0.75)* | *High EGDI (Between 0.50 and 0.75)* | | *Middle EGDI (Between 0.25 and 0.50)* | | *Low EGDI (Less than 0.25)* |

**E-Government, Accountability, and Performance, Fig. 2** Countries grouped by EGDI in alphabetical order. (Source: E-Government Global Survey 2014, p. 17)

infrastructure, adequate human capital, and online service delivery, are also of critical importance to the development of effective e-government for a sustainable and desirable future.

Focusing on the key findings of the survey, we can draw the main conclusions from the latest assessment of e-government and its relevance in terms of improving accountability and performance

in the public sector. There is a strong need to improve transparency to build accountability and trust, as well as to better perform in terms of efficiency and effectiveness, thanks to the investment in telecommunication, human capital, and provision of online services. In order to close the gap, there is the opportunity to promote and adopt the open government approach: by opening their data, their processes, and their services, governments can provide better, more attractive services at less cost, create jobs and growth opportunities, and increase accountability and trust. It also allows citizens to participate in the design, creation, and delivery of digital public services.

## Synonyms

Public administration; Electronic governance; Public sector reforms

## Definitions

*E-government* The application of information and communication technologies (ICTs) by government agencies in the public administration processes in order to improve the delivery of public services and enhance the interaction between citizens and public sector organizations.

| | |
|---|---|
| *Bureaucracy* | A system of administration which is performed by professionals on a continuous basis. |
| *Institutional reform* | A systematic approach in dealing with change, both from the perspective of an organization and on the individual level. |
| *Public administration reform* | It is considered as the search for administrative (public services) structures and processes that are more responsive to the needs of citizens and the delivery of better public services. |

## Introduction

Governments are tapping into the opportunities presented by information and communication technologies (ICTs) to modernize and solve challenges faced by public administration systems. The use of these information and communication technologies in the public administration system is known as e-government. E-government is defined as the use by the government and public sector agencies of information and communication technologies (such as wide area networks, the Internet, and mobile computing) that have the ability to transform relations/interaction with citizens, business, and other sections of government (Worldbank 2015). According to the World Bank, these technologies can ensure better delivery of government information and services to citizens, improved interactions with businesses and industry, citizen empowerment through access to information, and efficient government management system (Worldbank 2015). E-government is also considered as the use of Internet technologies to automate the delivery of online of government information and services, provide opportunities to increase citizens' access to government information and services, reduce government bureaucracy, increase citizen participation in democracy, and improve agency responsiveness to citizens needs/requirement (Chhabra 2018; Pagani and Pasinetti 2008).

E-government through ICTs can be a transformative tool to change the traditional mechanisms of delivery of public services and reshape the public administration sector and build a relationship between citizens and government (Panzardi et al. 2002). It presents a better option for governments to use the new technologies to provide citizens with more convenient access to government information and services, to improve the equality of the public services delivered, and to offer greater opportunities to citizens to participate in the democratic process (Osborne and Gaebler 1992). Greater openness and transparency in government public administration can be achieved through e-government programs. Through e-government portals, government agencies can provide information about the money allocated to their programs and how these funds allocated were administered (Panzardi et al. 2002). Disclosure of information to ensure public administration transparency includes information such as execution of budgets, purchase orders and public contracts, payment orders submitted to and issued by national treasury and other sectors of the public sector, financial and employment data about permanent and contracted staffs, accounts of public debt, inventory of plant and equipment and financial investments (Panzardi et al. 2002). These forms of information disclosure can increase transparency and accountability in every process of governance and development (Turnip et al. 2018). Building good reporting system and performance of government agencies, improving public access to information on the performance of government agencies, implementation of e-government to support modern bureaucratic management, and increased application of open government in all sectors of government (Turnip et al. 2018) are critical measures to ensure greater government transparency and accountability.

In addition, e-government core activities include the following: first, develop and deliver high-quality, seamless, and integrated public services; secondly, enable effective constituent relationship management; and thirdly, support the economic and social development goals of citizens, businesses, and civil society organizations

(Grant and Chau 2006). It can also reduce government bureaucracy by increasing efficiency and effectiveness in services and products and change in organizational structure and management (Turnip et al. 2018). Government bureaucratic system of management has often been criticized for its ineffectiveness and inefficiency in the delivery of good system of governance in the public sector. Public sector bureaucratic organizations are considered uncoordinated, unfriendly, unfair, not transparent, and complicated and have undue long processes of providing service as a result of the unpleasant experiences citizens have encountered in their interaction with government agencies (Turnip et al. 2018). Another issue in public administration of government agencies is undertaking strategic retooling/reengineering of government in the form of institutional reforms. Institutional reforms are the strategic decisions to improve the effectiveness and functionality of government and its public sector agencies. Public sector institutional reforms focus on enhancing the efficiency and effectiveness of public sector operations and management and instituting a modern information and communication infrastructure (Alberti and Sayed 2007). Driving and achieving public sector reforms is one of the cardinal tools and important steps to obtain transparency and accountability in public administration of government operations (Alberti and Sayed 2007).

The objective of this chapter is to discuss e-government as the fundamental and appropriate medium to achieve efficiency and effectiveness in government bureaucracy and institutional reforms in public administration. Government public sector reforms and bureaucracy are attached to the application of information technology through e-government. E-government can provide the needed institutional reforms/capacity to increase government transparency, efficiency, and citizens' confidence in government institutions (Evans and Yen 2006). E-government has been related to reform measures in the USA such as reinventing government, accountability measures like performance management and greater transparency, and improved communication with citizens (Fountain 2008; Tolbert et al. 2008).

This chapter is organized as follows: detailed literature on e-government, bureaucracy and institutional reforms, discussion, and conclusion.

## E-Government

The United Nations has indicated that the e-government phenomenon provides golden opportunities to transform public administration into an instrument of sustainable development (Nations 2014). E-government leverages the transformative nature of information and communication technology to transform the relationship between governments and their related agencies and citizens and the general public. It is considered as the interaction of government with citizens and public and private sector (businesses) through the powerful means of information technology to deliver services which are effective and efficient (Lee 2010; Rorissa et al. 2011). Based on the nature of interaction and communication (citizens, businesses, government employees, and government agencies) that occurs within the e-government platform, there are different forms of e-government interactions. These forms of interaction which are based on the kind of services delivered on e-government platform are government to citizens (G2C), government to businesses (G2B), government to employees (G2E), and government to government (G2G). E-government makes the existing interaction to be convenient, transparent, less expensive, and effective for the parties involved.

The government-to-citizen (G2C) form of e-government provides facilitation to the dissemination of public information services and general services such as citizen filling of taxes; renewals of licenses; applying for birth, death, and marriage certificate; and also getting services on education, healthcare, hospital information systems, access to public libraries, etc. The government-to-business nature of e-government ensures that the interaction between government and business sector is streamlined and enhanced. Some of the services which can be provided through the G2B e-government platforms are the dissemination of government policies and regulations; getting

business information; downloading application forms; renewing of licenses, business registration, and permits; and the payment of tax returns. The G2B forms of e-government can also include e-procurement and e-bidding of government goods and services. The government-to-employee form of e-government has to do with the provision of services that relates to the government sector employees, and it borders on, for instance, the dissemination of information on pay systems to employees and human resource training and development. In addition, the government-to-government (G2G) form of e-government services has to do with the interaction between central and local government agencies, businesses, and among different departments. It ensures the provision of electronic sharing of data/information systems between and among government agencies and departments and improves communication and access to data between government agencies.

## E-Government Development Model

Since the emergence of e-government as a field of research, many scholars have attempted to provide a model which describes the various forms or stages that the development of e-government has to go through. The most popular among the models is the Layne and Lee's model which proposed a four-stage development of e-government. The four stages are the catalogue, transaction, vertical integration, and horizontal integration (Layne and Lee 2001). Other scholars have extended the model proposed by Layne and Lee (2001) through the integration of different themes, but these extensions are similar to the basic concept of e-government development stages (Andersen and Henriksen 2006; Coursey and Norris 2008; Gil-Garcia and Martinez-Moyano 2007; Hiller and Bélanger 2001; Wescott 2001).

## Layne and Lee's Four-Stage Model of E-Government Development

Cataloguing, transactions, vertical integration, and horizontal integration are the four stages of growth model for the development of e-government recommended by Layne and Lee (2001). The different states of e-government development were proposed in order to offer a broader understanding of public administers of traditional organizations to reflect about e-government and their organizations (Layne and Lee 2001). According to Layne and Lee (2001), the four stages of e-government prescribe the transformation structure of government as it makes efforts in achieving electronically enabled government and how the Internet-infused government models become integrated with the traditional concept of public administration. This four-stage model is depicted in Fig. 1 and briefly explained in the next paragraphs.

### Catalogue Stage

The catalogue stage is considered the first most important stage in the development of e-government where governments try to show their presence online due to the call and demand from ordinary citizens, policy makers, and the general public for the government to make information available online. At this stage, the government reacts by creating government and local government websites because of the mounting pressure from the media, technology-literature employees, citizens, and other key stakeholders for government to provide information online (Layne and Lee 2001). Governments at this stage make an effort to make non-transactional information available to citizens and other stakeholders for use. Hence this stage is just informational period to fill the void in the information between the government and its stakeholders.

The access of information from the government is driven by the fact that citizens can request and access information and services from the private sector from the internet (web) (Layne and Lee 2001). While the web presence of government online at this stage benefits citizens, government agencies and staff also equally benefit since dealing with basic questions about government information and services can be done online hence reducing the workloads of employees (Layne and Lee 2001). The simple web presence of government at this stage is enough to empower citizens as to where to locate government services and seek post-service support when needed.

**E-Government, Bureaucracy, and Institutional Reform, Fig. 1** Stages of e-government development (Layne and Lee 2001)

### Transaction Stage

The second stage (transaction) is driven by citizens' expectation and demand for government and its agencies to offer full services online. The transaction state according to Layne and Lee (2001) provides a better opportunity for improved efficiency for both citizens and government agencies as compared to the cataloguing stage which simply provides information (Layne and Lee 2001). This stage is considered the starting point of e-government as a revolutionary tool to transform the interaction between citizens and government (Layne and Lee 2001). The transaction stage serves as an empowerment tool to empower citizens to better interact with government agencies online, anytime, thus reducing hours of paper work, the inconvenience of traveling to government offices, and time spent waiting in queues (Layne and Lee 2001). The transaction stage, therefore, enables active two-way communication between the government and citizens.

### Vertical Integration Stage

According to Layne and Lee (2001), the vertical stage has to do with government efforts toward achieving the transformation of government services than just automating and digitizing of existing systems. This stage must ensure that e-government initiatives are associated with or lead to the reconceptualization of the government service itself, and thence full benefits of e-government will be achieved only when organizational changes accompany technology changes (Layne and Lee 2001). The transaction stage ensures the vertical integration of separate databases that are not connected to other governmental agencies at the same level or similar levels.

### Horizontal Integration

The horizontal integration stage is considered the integration of government services across different functional walls (Layne and Lee 2001). This stage offers opportunities for governments to provide one-stop public services centers through

e-government platforms. It ensures that databases across different functional areas are able to communicate with each other to share information so that information gathered or obtained by one agency can easily be accessed by other government functions (Layne and Lee 2001). According to Layne and Lee (2001), horizontal integration is e-government system integration across different functions in that transaction in one department or agency can lead to automatic checks or authentication against data in other functional departments or agencies.

### Synthesis of Other E-Government Development Models

A qualitative meta-synthesis was used to compare and contrast twelve different e-government stage models in order to develop a common frame of reference for e-government development (Lee 2010). The proposed frame of reference based on the 12 models was made up of 5 metaphorical stages such as presenting, assimilation, reforming, morphing, and e-governance (Lee 2010). This reframed reference was later decomposed into two themes, that is, citizen/service and operation/technology, with other nine basic concepts such as information, interaction, integration, transactions, streamlining, participation, transformation, involvement, and process management (Lee 2010). The common reference of e-government development model proposed by Lee (2010) was based on other models of e-government development model identified in the literature (Andersen and Henriksen 2006; Hiller and Bélanger 2001; Layne and Lee 2001; Moon 2002; Wescott 2001; West 2004). These 12 models in the literature are shown in Table 1.

Based on these reviews of the 12 models in the literature, 5 metaphors and 2 stages or concepts were developed. These metaphors along with their definition and concepts are shown in Table 2 and graphically in Fig. 2.

### The Common Frame of Reference for E-Government Stage Models

The common frame of reference for e-government stage models developed by Lee (2010) is illustrated in Fig. 3.

#### Presenting Stage Metaphor

The presenting stage metaphor is the first step in the common reference for e-government models developed by Lee (2010)). This stage has to do with the presentation of basic government information online by cataloguing, publishing, scattered information, and billboard periods (Lee 2010). Citizens and businesses can have access to informational e-government services at this period of the e-government development process. This section (presenting metaphor) is similar to the first-stage cataloguing in the Layne and Lee four-stage model of e-government development.

#### Assimilation Stage Metaphor

The assimilating stage metaphor has to do with the interaction and integration of e-government functions across sectors (Lee 2010). It is the assimilation of basic computing ability, i.e., process and services with real-world issues (Lee 2010). At this stage, there is the emergence of interacted public services which allow the citizens to download and upload documents, seek guidance and assistance, and enhance two-way communications between them and agency officials. It must also be stated that the assimilating state metaphor proposed by Lee (2010) is the same or similar to the integration stage proposed by Layne and Lee (2001).

#### Reformation Stage Metaphor

The reforming stage metaphor is made up of the transaction and streamlining of e-government services (Lee 2010). The reforming period has to do with the transformation and reformation of business processes of government through streamlining to properly use information technology to better serve its citizens. According to Lee (Lee 2010), at this stage, the political and administrative process and services are reformed to provide enhanced public services to businesses and citizens. The ultimate goal at this reformation stage of the e-government development process is to attain greater efficiency in the public delivery system.

#### Morphing Stage Metaphor

According to Lee (Lee 2010), morphing has to do with the changes that occur in the shape and scope

**E-Government, Bureaucracy, and Institutional Reform, Table 1** Comparison of stages in e-government developmental models (Lee 2010)

| Authors | Garner Group (mode l 1) | Deloitte Research (mode l 2) | Layne and Lee (model 3) | Hiller and Belanger (model 4) | Scott (model 5) | United Nations (model 6) | World Bank (model 7) | Netchaeva (model 8) | Accenture (model 9) | West (mo del 10) | Siau and long (model 11) | Anderson and Herriken (model 12) |

**E-Government, Bureaucracy, and Institutional Reform, Table 2** Metaphors: definitions, related stages, and themes

| Metaphors | Descriptions | Stages/concepts | |
|---|---|---|---|
| | | Citizen and service | Operation technology |
| Presenting | Present information in the information space | Information | |
| Assimilating | Assimilates (or replicates) processes and services in the information space with the eons in the real world | Interaction | Integration |
| Reforming | Reform the processes and services in the real world to match the information space requirements, fitting for efficiency | Transaction | Streamlining |
| Morphing | Change the shape and scope of process and services in the information space as well as the one in the real world, fitting for effectiveness | Participation | Transformation |
| E-governance | Process and service in both worlds are synchronously managed, reflecting citizen-involved changes with reconfigurable processes and services | Involvement | Process management |

**E-Government, Bureaucracy, and Institutional Reform, Fig. 2** The relationship between themes and stages (Lee 2010)

of processes and services of the e-government development process for effectiveness. The morphing stage is integrated with the previous stage the reformation stage in order to achieve a complete change in the business operations of government and its agencies (Lee 2010). The morphing stage is considered the in-depth and complete transformation of government businesses which encourages the government to develop new services to meet the demands of

**E-Government, Bureaucracy, and Institutional Reform, Fig. 3** A common frame of reference for e-government stage models (Lee 2010)

citizens (Lee 2010). This complete transformation of government through morphing is an important step which makes citizens active participants and toward the effectiveness of e-government services than just the efficiency of governing processes and services in the reforming stage (Lee 2010).

### E-Governance Stage Metaphor

E-governance is the metaphor for the last stage of e-government development developed by (Lee 2010) after attaining the period of the morphing of services and operations. The morphing stage presented the foundation for the change in the norms of government and governance processes. At this stage of the e-government development process, citizens can play an active part in the political and administrative decision-making (Lee 2010). The e-governance stage is the stage where the business process of administrative and political services reconfigured or altered based on inputs and actual participation of citizens in the decision-making of the government through the mediated powerful channel of information and communication technologies (Lee 2010).

#### Key Relationships in E-Government

E-government has the capacity to reshape the existing relationship between government, administrators, and citizens. The three core nature of relations that e-government transforms is depicted in Fig. 4. These three key e-government relationships are e-democracy, e-services, and e-administration (Wihlborg 2005). The e-democracy form of e-government relationship has to do with the interaction between citizens and their elected political authorities (Wihlborg 2005). The e-services form of e-government relationship is about the interaction between the government public administrators and citizens, and the e-administration has to do with the internal application of information technology in government agencies to provide assistance for policy decision-making (Wihlborg 2005).

E-administration can be used as a tool to bring about the needed radical restructuring of the government administration processes thereby facilitating and building new relationships in bureaucracy (Bernhard 2013).

## Bureaucracy

### The Concept of Bureaucracy

The concept of bureaucracy is hard to conceptualize as a single definition as the term "bureaucracy" means different things to different scholars with regard to the field they espouse. Different academic fields such as comparative government,

**E-Government, Bureaucracy, and Institutional Reform, Fig. 4** Three key e-government relationships (Wihlborg 2005)

the sociology of organizations, public administration, and political economy all perceive and conceptualize bureaucracy from their perspectives. These different conceptualizations of bureaucracy are the major reason for the inability of scholars to provide an apt and all fitting definition of what bureaucracy is about. Bureaucracy application in the context of comparative government means a kind of political system which is literally termed "rule by the bureau" (Altay 1999). In this context, bureaucracy was compared to the system of representative government where the elected authorities are deemed accountable to their representative parliament (Altay 1999). The sociology of organization usage of bureaucracy originated from the work of Max Weber who illustrated that bureaucracy should not be considered as a type of government but rather a system of administration which is performed by professionals on a continuous manner. In addition, the political economy understanding of bureaucracy has to do with a nonmarket organization financed by the government and other state agencies (Altay 1999). The last usage of bureaucracy is obtained from the field of public administration. Bureaucracy in the field of public administration stands for public administration which is in contrast to administration in the private sector (Altay 1999).

## Definition of Bureaucracy

While scholars have attempted to define bureaucracy, they end up not really providing a concrete definition of bureaucracy but rather characteristics or factors that describe what is or not about bureaucracy. Bureaucracy has to do with a system of government controlled by limited government officials of whom their powers threaten the liberties of the ordinary citizen. Also, it has been indicated that bureaucracy is characterized by a hierarchical administration structure in which state officials performs as a component of a complex system (Charlesworth 1968). In attempts to provide a comprehensive definition of bureaucracy it was categorized into seven aspects such as bureaucracy as rational organization, bureaucracy as organization efficiency, bureaucracy as ruled by officials, bureaucracy as public administration, bureaucracy as administration by officials, bureaucracy as the organization, and bureaucracy as modern society (Albrow 1970). In addition, bureaucracy has been described as the system of offices, hierarchy, appointment, prestige, and social stratification (Weber 2013). Also, Max Weber's idea/concept of bureaucracy has to do with the legitimacy of authority.

## Max Weber's Concept of Bureaucracy

Max Weber is one of the most referred to scholars when it comes to the concept of bureaucracy in public administration. Max Weber was a German sociologist who lived from 1864 to 1920, and he is considered to be one of the first scholars to have studied the concept of bureaucracy (Singh 2000). Max Weber considered bureaucracy to be rational, efficient, and honest since it is an improvement over the disorganized system of administration and governance that existed during his time. Weber provided six principles about the modern

system of officialdom such as fixed and official jurisdictional areas, hierarchy, and level of graded authority, where lower officers are supervised by the higher levels, management is based on official documents, officials have thorough and expert training that require the full-time work of the officials, and management abide by the rules (Singh 2000).

In addition, Weber considered bureaucracy as a form of organization with some essential elements such as separation office and its incumbent, selection by merits, the office is subject to discipline and control, hierarchy of offices, allocation of authority required to discharge activities, strict adherence to rules, and fixing of remuneration officials (Johari 1980). Also, authority is essential parts needed for the proper functioning of bureaucratic systems. In light of this, Weber distinguished between three pure forms of authority which are a traditional, charismatic, and legal authority. For him the concept of bureaucracy is linked to the legitimacy of authority and that legal authority is preferred than the other two forms of authority (traditional and charismatic). The charismatic authority has to do with the personal qualities that the individual leader possesses. It is defined as the quality of an individual personality by virtue of which he is set apart from ordinary men and treated as endowed with supernatural, superhuman with exceptional powers or qualities (Weber 2009). Charismatic authority is, therefore, a form of rule in which individuals submit due to their belief in the magical powers, revelations, and heroism of the individual leader (Fry and Raadschelders 2013). The charismatic form of authority is criticized for being constrained by the leader's personal judgments and not governed by any formal system of adjudication (Fry and Raadschelders 2013; Weber 2009). Often the relationship between the charismatic leaders and his followers is an unstable one since the authority is not obtained willingly from the followers (Fry and Raadschelders 2013) but involuntary. According to Weber, administration in the context of this form of authority is loose and unstable since the leader's disciples do have a regular occupation and they reject the methodical and rational pursuit of monetary rewards as undignified. Under the charismatic leadership, there is no laid down procedure for appointment, promotion, and dismissal and that there is no continued system of hierarchy which leaves the leader to intervene in the performance of every task (Fry and Raadschelders 2013). Particularly, the charismatics system of leadership has no clearly defined line of authority to protest against the arbitrary use of power and unavailability of formal rules to ensure that people are treated equally with due process (Weber 2009).

Another form of authority described by Weber is the traditional form of authority. The traditional form of authority is based on the belief in the sanctity of immemorial traditions and signifies the legitimacy of those exercising the power of authority over those who do not have (Bertram 1964; Gross 1964). In the traditional system of authority, people are succumbed to obey or follow the line because of the belief in traditional customs, conventions, and belief system. People have authority due to their inherited status from the traditional system, and their followers or subjects undertake command based on loyalty to the ruler and his long existence. In the context of the traditional system, the legitimacy of the system can be retained as long as the traditions and customs are adhered and respected by people within the organization or society. Weber is of the view that the system of administration under the traditional authority is best considered irrational because in this system, there is no properly trained staff with formal or technical training and that things are done based on the personal allegiance to the traditional authority (Fry and Raadschelders 2013). The traditional system of authority can also suffer arbitrary use of powers and that the use of justice is a combination of personal discretion (Gerth and Mills 2014; Weber 2009).

The last form of authority espoused by Weber is the legal form of authority which he considers as the best form of authority for bureaucratic systems to properly function/work in the modern era. He considered legal authority not only as of the most rational form of authority but in addition as the most efficient form of authority. The legal form of authority is hinged on the belief in reason and laws that are promulgated based on proper

systems and that persons exercising such authorities are acting in accordance with the rules and regulations prescribed (Fry and Raadschelders 2013; Raadschelders and Stillman 2007). The application of the laws and regulations under the legal authority is applicable to all within the organization without favors or personal feelings. It is strictly by the laws which guide the actions and inactions of personnel and officialdom. The legal system or authorities are people empowered to exercise such authority by either elected or appointed legal procedures. The adherence or obedience to the authority in a legal system is based on the following:

- An establishment of a legal system which can demand compliance and obedience from members of the organization
- That the law is a system of abstract rule which are applied to particular issues or cases and that they are implemented within the limits of the laws
- That the person in charge of exercising such authority or powers is also enjoined to comply and obey the law as well
- That the compliance to the laws is not subject to the person holding the authority but rather the impersonal nature of the laws that gave him the position in the first place

### Characteristics of Bureaucracy

In addition to expatiating that authority is the best form to describe what bureaucracy is, Weber outline some important features of bureaucracy. Some of these features of bureaucracy are first that the administrative classes who are in charge of maintenance and coordinating programs within the organization. The administrative classes are paid as full-time employees, and they are remunerated based on their positions within the organization. Importantly, the tenure of the administrative classes is governed by the rules and regulations pertaining to the organization. Secondly, hierarchy is another aspect of the feature of bureaucracy which is considered the basic characteristics of a bureaucratic organization. The hierarchy within the organization is arranged from descending from the top to the bottom and based on seniority where lower officers are monitored and supervised within the organization. The basic underlying concept of hierarchy in a bureaucratic organization is to ensure that there a firm system of control.

The third feature of bureaucracy is the division of work and labor within the organization. The work within the organization is divided into several specializations based on the competence of employees. The main purpose of the division of labor within the organization is to ensure clearly defined areas of skill and competence which empowers the individual employees to know where to operate and his limits as well. In addition, the activities within bureaucratic organizations are governed by laws, rule, and regulations (administrative regulations). The rules and regulations ensure stability, continuity, and predictability within the organization.

Another important aspect of bureaucracy is the impersonal nature of relationships with regard to the rules and regulations. The interaction among individuals within the organization is based on the rules and regulations, and it's devoid of personal attachment, emotions, and sentiments. Lastly, bureaucratic organizations are characterized by proper official record-keeping. These records are kept in order to guide the present and future endeavors of the organization.

### Public and Private Bureaucracy

Bureaucracy can be put into public or private depending on whether it is taking place within the government or private sector organizations. The form of bureaucracy which occurs at the government sector agencies or offices and public enterprises is termed as public bureaucracy. In contrast, private bureaucracy occurs in organizations that are private in nature where the government has no role in the operations of these private organizations. The main distinctions of public bureaucracy from the private bureaucracy are as follows:

- Public bureaucracy is politically controlled and influenced, less businesslike, and market-based which is different from the private bureaucracy.

- Public bureaucracy has more red tapes then the private bureaucracy.
- Public bureaucracy is considered to be rigid and controlled by strict rules and regulations which hinder freedom of action, while in the private bureaucracy, there is flexibility in its operations.
- A clear distinction is that while public bureaucracy is service-oriented, private bureaucracy is rather profited-oriented.
- Public bureaucracy activities and programs are constitutionally driven through either statutory or executive authority, while in private bureaucracy there is much freedom of behaviors.
- Public bureaucracy is often not able to adapt quickly to the changing environment due to the cumbersome nature of the factors of change, while in the private bureaucracy change is quicker and faster, and it is able to adapt to the changing times.
- As compared to private bureaucracy, public bureaucracy is more concern with ethics, social equity, justice, and fairness.

### E-Government and Bureaucracy

The inefficiency and challenges associated with bureaucracy such as the large size of government, corruption, slow pace to adapt to new trends, and inability to conform to the market competition have called for refining of bureaucratic systems to a system known as an e-bureaucratic system. The e-bureaucratic system is considered as an e-government form of enhanced transformation of the bureaucratic systems (Collins 2007). The e-bureaucratic system through e-government seeks to leverage on the benefits of the information and communication technology (ICT) as the foundation for effective coordination and the implementation of the values of equality and impartiality bureaucratic systems (Collins 2007). The ICT through e-government thus becomes an important ingredient and gasoline to reforming bureaucracy structures into an e-bureaucracy. In addition to ICT through e-government providing a basis for the transfiguration of bureaucratic systems into market-oriented organizations, it also enables and encourages bureaucratic administrative functions (Collins 2007). The bureaucratic administrative system thus becomes highly efficient and effective. E-government provides the impetus for bureaucracies according to Osborne and Plastrik (Osborne and Plastrik 1997) to reinvent itself by accepting and fostering change to bring about effectiveness, efficiency, adaptability, and capacity to continually innovate. The digitization of bureaucracy through e-government enables bureaucracies to adopt ICT tools such as office automation software, database management systems, management information systems, decision support systems, and integrated informational systems over the internet (Collins 2007). Bureaucratic government or systems which considered an old system infused with hard and fast, inflexible rules and regulations and less use of ICT are replaced by e-government which is seen as a faster, more effective, professional, accountable, transparent, and reliable (Bashar et al. 2011). This enabling environment provided by ICT through e-government to bureaucratic government according to Bashar et al. (Bashar et al. 2011) has shown and proved over time that e-bureaucracy is far better than the traditional bureaucratic system.

## Institutional Reform

Institutional reforms have been a major concern for public policy makers and practitioners within the larger context of public administration reforms. Institutional reform has often been linked to or considered as public administration reforms. Public administration reform or institutional reform is considered as the comprehensive changes in the institutional or administration systems such as organizational structures, decentralization, personnel management, public finance, result-based management, and regular reforms (UNDP 2004). Institutional reform/PAR goes just beyond modernizing state institutions and cutting or reducing civil service expenditure and costs but rather to improve the quality of service delivery and social responsibilities and to promote broader citizen participation in the decision-making and feedback on public service output or performance (UNDP 2004). Institutional reform can bring about greater efficiency in public administration, increased transparency and

limiting or preventing corruption and respond swiftly to the needs of citizens. It can further ensure active participation and transparency in decision-making through the creation of a good environment for the engagement of stakeholders. Institutional reform can also ensure greater accountably of major actors in the public administration system.

Institutional reforms can be categorized into civil service reforms, efficiency and responsiveness of the policy-making system, and reforming the machinery of government and the public sector revenue and expenditure management system (UNDP 2004). The civil reform covers the operational capacity of the civil service to deliver on its goals and visions (mandate). The capacity building for the civil service includes the creation of a government workforce with the right skill set, motivation, and professional ethos and accountability and is client-orientated. Improving the policy-making system has to do with putting in mechanisms for the horizontal coordination in policy initiatives and implementation, developing a process for setting the policy-making agenda and designing a system that ensures that policies initiated are hinged on correct analysis. It also has to do with ensuring that systems are in place to disseminate policy initiatives and decision and the monitoring of the implementation process (UNDP 2004). The restructuring of the machinery of government has to do with the allocation and reallocation of functions between departments and sometimes may lead to the privatization of government bodies and agencies. The emergence of new tools such as information and communication technologies according to UNDP (2004)) has created greater opportunities for better coordinating the different branches of government and promoting efficient interaction between citizens and government.

### E-Government and Institutional Reform

The implementation of right information and communication technologies (ICTs) through e-government is fundamental and instrumental in achieving greater public sector institutional reforms/public administration reforms. E-government has become a powerful tool that can be deployed to address and provide innovative solutions to the challenges or defects in public administration systems. It can provide greater transformation and reorganization of functions across sector agencies by facilitating better user-friendly service delivery, improved interaction with businesses and ensure more efficient and rigorous management of government business (UNDP 2004). Implementing e-government has the capacity to enhance the institutional internal working administration system which is one of the major concerns for institutional reform. For instance, according to UNDP ( 2004), the introduction of management information systems within government agencies can ensure improved personnel management, cost reductions, improvements in service delivery and government procurement, and increased revenue gathering.

## Discussion and Conclusion

The reforming of public bureaucracy along with its institutions has been a long call for many centuries now, and many public sector organizations are responding positively to these calls for reforms. These reforms can be comprehensive and may cover areas such as decentralization, personnel management, public finance, results-based management, regulatory reforms, and organizational structures. E-government is seen as the catalyst and a propelling force to fully realize the major objectives and goals of public sector institutional reforms and its bureaucratic systems. Meaningful outcomes can be recorded when policy makers and government agencies fully embrace e-government as the basis for achieving greater transformative public sector reforms along with its bureaucratic systems. It can drive and ensure well-performing public institutions and good governance for development. Importantly, promoting institutional reforms and bureaucratic systems through e-government can bring about a higher degree of efficiency, effectiveness, accountability and openness, and collaboration and interaction between citizens, businesses, and government agencies.

# E-Government, Japan

Tetsukazu Okamoto
Kansai University, Osaka, Japan

## Synonyms

Digital government; e-governance; e-public administration; Informatization of government

## Definition

A governmental form actively employing information and communication technologies (ICTs) for the purpose of making governmental operation more efficient, improving the quality of public service delivery, and enhancing citizen access to government information.

## Usage of the Term "e-Government" in Japan

There is no universally accepted definition of "e-government" (Yidiz 2007: 650). The United Nations Department of Economic and Social Affairs, for example, defined e-government as a new kind of rationalization that has been introduced in the public sector by the use of modern information and communication technologies (ICTs) to provide citizen services, improve transparency and accountability in government functions, and allow for cost savings in government administration (UN DESA 2008: 2). As another example, a public administration scholar argued that e-government has become the label and guiding vision for the intensive use of ICT applications in the fulfillment of functions of politics and public administration (Snellen 2005: 399).

Generally, the term "e-government," or "digital government," can be broadly defined as follows: the utilization of ICTs by the government for fulfilling its various functions, such as service delivery or disseminating government information to its citizens. The Japanese government has employed various terms to describe the development of ICT use in public sectors, such as "informatization of public administration," "digital government," "e-public administration," and "e-government" ("denshi seihu" in Japanese). It was in *The Basic Plan for Promoting Informatization in Public Administration* (revised edition, 1997) that the term "e-government" appeared for the first time in the official documents of the Japanese government. In this document, e-government was defined as a highly informatized administration managing information electronically, and a goal of fully developing e-government by the beginning of the twenty-first century was declared by the government.

Currently, the government is more likely to employ the term "electronic (or "e-") public administration" ("denshi gyosei" in Japanese) rather than to employ "e-government." Examples of this can be found in *The Declaration to be the World's Most Advanced IT Nation,* established by the government in 2013 and amended in 2016, the purpose of which was to "drive the resurgence of Japan by becoming the world's most advanced model for IT use." The official document stated that realizing more innovative and transparent "e-public administration" was the goal of the government.

Both "e-public administration" and "e-government" have been so far employed in much the same sense, both referring to the utilization of ICTs by the government, although Kamimura (2010) pointed out that e-public administration tends to be more broadly defined than e-government to embrace informatization in both the national government and local governments (p. 34).

## The Purposes of e-Government in the Japanese Government

Since the 1990s, many politicians and policy makers have perceived ICTs as a means to realize and further implement the notions of administrative reform and new public management (Homburg 2008: 88). By the same token, the Japanese government has perceived e-government, or "the informatization of public administration," as a way to promote administrative reform. An example of such an idea was found in the report submitted by the Second Provisional Commission for Administrative Reform established by the Japanese government. This commission served as an influential deliberation council. Some of its main accomplishments were the privatization of the Nippon Telegraph and Telephone Public Corporation in 1985 and that of the Japanese National Railway (JNR) in 1987. In the report, the Second Provisional Commission for Administrative Reform recommended that the government should recognize the streamlining of government operations while coping with the impact of informatization on society as an urgent task for the government, and it regarded promoting an office automation (OA) system as an integral part of achieving the task.

The trend of administrative reform in the 1980s and 1990s led to *The Basic Plan for Promoting Informatization in Public Administration* (hereafter "the Basic Plan") in 1994, which was the first master plan to further overall informatization of the government in a planned way. The 1997 revised version of the Basic Plan definitely positioned the informatization of public administration as an essential tool for promoting administration reform effectively.

Since the Basic Plan, many guidelines or rules regarding the promotion of e-government have posited the informatization of public administration as a measure to drive administrative reform. The Basic Act on the Formation of an Advanced Information and Telecommunications Network Society of 2000 (hereafter "the IT Basic Law") is the most important among the rules for the government information and telecommunication policy. It is called "the Constitutional Law for Information policy" at times and has a provision stating that the necessary action should be taken to actively promote informatization of public administration, such as increased use of the Internet and other advanced information and telecommunications networks in the administrative affairs of the national government and local governments, to streamline governmental operations and increase efficiency.

Given that ICT use by the government has improved the efficiency of government operations to some extent, recently, the government has precipitated a shift in the purpose of developing e-government from just reducing cost and improving efficiency to promoting effective use of data using digital technologies for the purpose of building an affluent society. In *The Declaration to be the World's Most Advanced IT Nation and the Basic Plan for Promoting Interchangeable Data Use Between the Public and Private Sectors,* established by the government in 2017, for instance, on the assumption that connecting data from various sources closely could produce added values for society, the government should plan to ensure that data generated by both the national or local governments and the private sector will be made available openly.

## The Institutional Framework for Making e-Government Policy in Japan

A governmental body playing a leading role in the making of information policy, including a policy concerning the development of e-government, is the Strategic Headquarters for the Promotion of an

Advanced Information and Telecommunications Network Society (hereafter "IT Strategic Headquarters"), which was established within the Cabinet on the basis of the IT Basic Law of 2001. The Prime Minister is selected as the Director-General of the IT Strategic Headquarters. The Vice Director-General is appointed from among the Ministers of States (Minister of IT Policy; Chief Cabinet Secretary; Minister of Internal Affairs and Communications; and Minister of Economy, Trade, and Industry have all been appointed as the Vice Director-General as of 2017). In addition to these members, all Ministers of State, other than the Director-General and the Vice Director-General, and those who are knowledgeable about "an advanced information and telecommunication network society" are appointed as IT Strategic Headquarters members by the Prime Minister.

The IT Strategic Headquarters engages in the preparation and facilitation of a priority policy program to form an advanced information and telecommunications network society (Article 26, IT Basic Law). As for promoting e-government, the main function of the IT Strategic Headquarters is to produce the overall guidelines for the government as a whole. Each ministry and agency, based on the guidelines, formulates and implements their ICT-related programs.

The position of Chief Information Officer (the Ministry CIO) was established at the ministries in 2002. It is a common practice that the Deputy Vice Minister, or the equivalent, plays the role of Ministry CIO. While the Deputy Vice Minister's position is high enough to oversee their own ministry's ICT programs, they are not necessarily knowledgeable about ICTs and must perform many tasks other than ICT-related ones. For that reason, an expert on IT management, most of the time recruited from outside the government, is appointed as a Deputy Ministry CIO, who assists the Ministry CIO in formulating information policy.

Government information systems of Japan have been developed by each ministry independently. Due to this decentralized manner, some problems have arisen such as functional duplication or a lack of cooperation among government information systems. A more centralized institutional framework is required to address these problems, one that includes an authoritative body established nearly at the center of the government to oversee and coordinate each ministry's IT policy.

With expectations to assume this responsibility, the government set up the Deputy Chief Cabinet Secretary for Information Technology Policy (hereafter "Government CIO") at the Cabinet Secretariat in 2013. The IT Basic Law and the partial amendment of the Cabinet Law provide a legal basis on which the status of the Government CIO is established. One of the main duties of the Government CIO is to supervise the government's ICT-related programs for increasing convenience of public service to the citizens and for improving administrative functioning.

The Government CIO is appointed as a member of the IT Strategic Headquarters and advises the Director-General, i.e., the Prime Minister, on how to implement important programs concerning the building of an advanced information and telecommunications network society. The leadership by the Government CIO is expected to enhance IT governance within the government.

## Future Prospects of e-Government in Japan

The United Nations e-Government Survey 2016, which ranks countries by measuring their use of ICTs to deliver public services, found that Japan was ranked 11th among 91 countries, down from 6th in 2014. The Japanese government clearly stated in *The Declaration to be the World's Most Advanced IT Nation and the Basic Plan for Promoting Interchangeable Data Use Between the Public and Private Sectors* of 2017 that it is necessary to implement measures or programs selectively in order to be ranked the highest among countries being ranked on the ICT use by the government.

The adoption of a national identification number system, with one specific number assigned individually to every citizen, is an effective measure to improve the value of public service with the use of ICTs and to be ranked higher in the ICT use ranking. The identification number system could provide for public services online through one-stop platforms, making it easier for people to interact with public administration (UN DESA 2016: 2). The world's leading IT countries like South Korea and Estonia, to name a few, have adopted the system from an earlier period. In Japan too, a national identification number system, commonly known as "My Number System" (pronounced "Mai Nanbaa" in Japanese), was adopted in 2015, with a 12-digit number assigned to every person possessing a resident record.

Unlike the US Social Security Number (SSN), which is not only used by official bodies but by private businesses for commercial purposes, the availability of a My Number is limited to the national and local governments. On the other hand, My Number System is dissimilar to a German-style identification number system, in which a different number is employed by each public service system. The Japanese government intends a My Number to be a unitary number commonly used among various public services. The administrative use of a My Number, however, is restricted only for social security and tax-related purposes (as of September 2017) due to privacy protection concerns. The Japanese government is planning to expand the use of a My Number to other purposes, such as healthcare or passport issuing.

In conjunction with the adoption of the "My Number System," the government has launched the issue of a card containing public certification service for individuals, which is nicknamed "My Number Card." In cases where residents conduct administrative procedures, such as the submission of an application or a notification via the Internet, an identification process can be carried out more conveniently with the use of the My Number Card, by which identity theft or data falsification can effectively be prevented. The government has perceived the popularization of the My Number Card among the citizens as a priority for enhancing the IT infrastructure. To increase the penetration rate, the government is encouraging the use of the My Number Card as an identification card, starting from public sector employees to those in the private sector.

According to the research by the Ministry of Internal Affairs and Communications, however, the national penetration rate of the My Number Card was just about 11% as of July 2018. A part of the reason is that the My Number Card is issued only to applicants who go through the procedure on a voluntary basis (as of July 2017).

## Conclusion

It has been said that many of the Japanese hold negative feelings toward being assigned an individual number because of the fear of being kept under surveillance by public authorities. Eliminating this anxiety, for example, by strengthening privacy protection, is necessary for developing the Japanese e-government rapidly.

# E-Government: Informatization of Government and Politics

Mete Yildiz
Hacettepe University, Ankara, Turkey

## Synonyms

Digital government; E-government; Electronic government

## Definition

E-government is defined as the relationships between governments, their customers (businesses, other government units/types, and citizens), and their suppliers (again, businesses, other government units/types, and citizens) by the use of electronic means.

## Introduction: Government and Technology

Early students of technology regarded technological issues in government as a peripheral concern rather than as a core management function. The concept of technology is used rather loosely here. In addition to the meaning of "machines and sophisticated devices," technology also generically means the study of techniques or tasks (Perrow 1967, p. 162). The main objectives of technology use in government were enhancing the managerial effectiveness of public administrators while increasing government productivity. Taylor's scientific management movement is a perfect example to this orientation (Waldo 1955, pp. 18–19). Technology was seen as a means to manage the limitations of bounded rationality and provide the infrastructure for better decision-making (Simon 1976, p. 286). Perrow (1967) argued that technology is an important determinant of the structure and the strategy of the organizations that use it. Until the introduction of the Internet and widespread use of personal computers, technology was a peripheral governmental concern. Until then, the main use of technology in government organizations was the automation of mass transactions such as financial transactions using mainframe computers (Schelin 2003, p. 121). Thus, technology was buffered from the core in order to manage the uncertainty. This was necessary since technology and environments are the two basic sources of uncertainty that challenge rationality in organizational decision-making (Thompson 1967, p. 1). In addition, since information technology (IT) was used for the automation of backroom operations and improvement of the efficiency of clerical activities (Zuboff 1988), government IT professionals were isolated from functional and executive oversight (Holden 2003, p. 56).

The diffusion of personal computers in the 1980s provided each public administrator with a personal information technology system and thus opened a new period of IT use in government. At this point, technology management began to be decentralized in government agencies. Along with decentralization came the realization that IT issues should be integrated to the core functions in government. Three important events marked the movement toward the integration of technology and technology-related issues in public administration. The first is the Urban Information Systems (URBIS) project, which was conducted from 1973 to 1978 at the University of California, Irvine, by a multidisciplinary team. This was the "first large, systematic, empirical study to focus specifically on policy and outcomes related to computer use in complex service organizations" (King 2004, p. 97). It uncovered the "continuing social and political processes in which the technology is constrained – somewhat controlled and shaped – by its environment" (Danziger et al. 1982, p. 7). These researchers adopted an open

This encyclopedia entry is a revised and updated version of a section of the following PhD dissertation: Yildiz, Mete. 2004. "Peeking into the Black Box of E-government Policy-Making: The Case of Turkey." Unpublished Ph.D. dissertation, Public Affairs Program, Indiana University Bloomington, pp. 7–19.

systems theory perspective of technology and its environment and emphasized the continuous interaction between government organizations and their internal and external environments (Danziger et al. 1982, p. 8). They argued that, "computing will reinforce the power and influence of those actors and groups who already have the most resources and power in the organization" (1982, p. 18). Second, in 1985, a National Association of Schools of Public Affairs and Administration (NASPAA) committee recommended that computing should be a main skill taught in MPA programs (Northrop 2003, p. 2). Third, Bozeman and Bretschneider (1986) wrote a seminal article in the Public Administration Review, in which they argued that technology is transforming the government, and more academic attention should be given to this area. Still, one had to wait for the widespread use of the Internet and the Web for the emergence of a full-fledged e-government concept. Before this, IT use in government was primarily internal and managerial (Ho 2002).

Together with the introduction of the World Wide Web, the 1990s also witnessed the incorporation of IT to government reform with the National Performance Review Report in 1993 and the resulting "reinventing government" movement. The enactment of some very important legislation during this decade supported the reform movement and the use of IT in government (Schelin 2003, pp. 122–123). The 1995 amendment of the 1980 Paperwork Reduction Act (PRA) provided guidelines for government IT investments and encouraged more cross-agency information sharing. The 1996 Electronic Freedom of Information Act (EFOIA) clarified the rules for issuing of and public access to the government electronic records. The 1996 Personal Responsibility and Work Opportunity Reconciliation Act (PRWORA) mandated the social services agencies to test the promise of e-government applications on the field at intergovernmental levels. The 1996 Clinger-Cohen Act created the position of chief information officers in every agency and encouraged the integration of IT into the strategic planning process. All of these legislative efforts culminated in the enactment of the 2001 E-Government Act, which provided both the organizational and financial infrastructure of widespread e-government applications (Schelin 2003, p. 124). The tragic events of September 11, 2001 and the terrorist acts throughput the world since then caused the utilization of technology in massive proportions ranging from the centralization and consolidation of government databases to the use of emerging technologies such as biometrics in efforts against terrorism.

## Definition of E-Government

Information and communication technologies (ICTs) increasingly diffuse into every aspect of our lives and nearly every academic discipline. From the standpoint of public administration, the Internet stands out among these new technologies because of its numerous uses (Web browsing, e-mail, electronic file transfer, electronic discussion groups, etc.). More importantly, ICTs were recognized to have tremendous administrative "potential." For example, ICTs could help create a networked structure for interconnectivity, service delivery, efficiency and effectiveness, interactivity, decentralization, transparency, and accountability. Electronic government, or e-government, has emerged as a popular catch phrase in public administration to cover all of these functions.

E-government is defined as "utilizing the Internet and the World Wide Web for delivering government information and services to citizens" (ASPA and UN 2002, p. 1). It may also include using other ICTs in addition to the Internet and the Web, such as "database, networking, discussion support, multimedia, automation, tracking and tracing, and personal identification technologies" (Jaeger 2003, p. 323). Fountain (2001, p. 4) prefers to call this phenomenon "digital government" or "virtual state" instead of e-government.

> Digital government . . . is a government that is organized increasingly in terms of virtual agencies, cross-agency and public-private networks whose structure and capacity depend on the Internet and web. . . . The virtual agency, following the web portal model used in the economy, is organized by client.

Brown and Brudney (2001, p. 1) define e-government as the use of technology, especially Web-based applications, to enhance access to and efficiently deliver government information and services. They categorize e-government efforts into three broad categories of Government-to-Government (G2G), Government-to-Citizen (G2C), and Government-to-Business (G2B). One may include two additional categories in this list: Government-to-Civil Societal Organizations (G2CS) and Citizen-to-Citizen (C2C), if the interaction among citizens is related to the other three categories of e-government.

## Models of E-Government Development

E-Government development is studied by building models of its stages. The first model, presented by Layne and Lee (2001, p. 124), argues that e-government projects evolve through four stages of development as their integration and technological and organizational complexity increase. The first stage is cataloging, providing government information by creating government agency Websites. At this stage, only one-way communication between the government and the governed is possible. The second stage is transaction. Agencies at this stage can provide online transactions with government agencies. This makes two-way communications possible. The cataloging and transaction stages focus on creating an electronic interface for government information and services. The third stage is the integration of government operations within functional areas in government. Agencies working in the same functional area integrate their online operations, for example, database sharing by the FBI, CIA, and NSA. The final stage is horizontal integration. Different functional areas are integrated within the same electronic system and put to use through a central portal. The last two stages focus on the integration of the provision of e-government activities within the existing governmental structure.

The second model of e-government development was introduced in a study conducted by the American Society for Public Administration (ASPA) and the United Nations (2002, p. 2). It proposed a five-stage model of development. The first stage is the "emerging" stage, in which an official online government presence is established. Second, a number of government sites increase in number and become more dynamic in this "enhanced" stage. The third "interactive" stage enables the users to download forms and interact with officials through the Web. In the fourth "transactional" stage, users have the ability to make online payments for transactions. The final "seamless" stage makes the integration of electronic services across government agencies possible.

The ASPA-UN model is very similar to that of Layne and Lee (2001, p. 124). The ASPA-UN "emerging" and "enhanced" stages roughly correspond to Layne and Lee's cataloging stage. The "interactive" and "transactional" stages are comparable to "transaction" stage of Layne and Lee. The "seamless" stage covers both vertical and horizontal integration. Recognizing the overlap, Schelin (2003, p. 129) organized a typology of e-government by using both models (see Table 1 below).

Both Layne and Lee (2001) and the ASPA-UN (2002) models, as well as the Schelin (2003) typology, are oversimplifications. Stages of e-government development do not necessarily follow each other neatly in a chronological or linear order. Moreover, such models may not be applicable to e-government development in developing countries, as those countries have a chance to learn from the e-government successes and failures of developed countries. Thus, developing countries have a much faster learning curve; they can perform the requirements of all the stages almost simultaneously.

### Technology Enactment View of E-Government

Fountain (2001, pp. 10–14) introduced the technology enactment framework in her book "Building the Digital State." This framework has three main elements (see Fig. 1 below). First, application of IT to an organization changes the objective form of that technology due to its adjustment to the organizational form. Second, there is a two-way interaction between the existing institutional

**E-Government: Informatization of Government and Politics, Table 1** E-government typology

| Stage | Orientation | Services | Technology | Citizens |
|---|---|---|---|---|
| Stage one: emerging Web presence | Administrative | Few, if any | Only Web | Going it alone |
| Stage two: enhanced Web presence | Administrative, information | Few forms, no transactions | Web, e-mail | Links to local agencies |
| Stage three: interactive Web presence | Information, users, administrative | Number of forms, online submissions | Web, e-mail, portal | Some links to state and federal sites |
| Stage four: transactional Web presence | Information, users | Many forms and transactions | Web, e-mail, digital signatures, PKI, portals, SSL | Some links to state and federal sites |
| Stage five: seamless Web presence | Users | Mirror all services provided in person, by mail and by telephone | Web, e-mail, PKI, digital signatures, portal, SSL; other available technologies | Crosses departments and layers of government |

Source: Schelin (2003), p. 129; adapted from ASPA and UN (2002) and Ho (2002)

**E-Government: Informatization of Government and Politics, Fig. 1** Technology enactment framework. (Source: Fountain 2001, p. 11)

arrangements and organizational forms. Third, the first two elements, that is, adoption and implementation processes, transform the objective form of technology to its enacted form (Bretschneider 2003, p. 738). In other words, technology is customized to the needs and the environment of a specific organization through the process of enacting.

Fountain's technology enactment framework is criticized for three reasons. First, Bretschneider (2003) argues that the framework is so abstract and generalized that it is difficult to use it for prediction. He also emphasizes the lack of numerous testable hypotheses in Fountain's work. Norris (2003) agrees with this argument and asserts that the cases do not present enough evidence to test the enactment theory. For example, both scholars think that Fountain exaggerates her case for inter-organizational alternatives to bureaucracies (Bretschneider 2003, p. 741; Norris 2003, p. 422). Norris even argues that the book is not about IT and institutional change but about

organizational politics (2003, pp. 421–422). Garson (2003, p. 430) reevaluates Fountain's leading case and presents evidence that the case evolved much differently than its presentation in the book. Yang contends that Fountain's use of neoinstitutionalist theory fails to explain how agents overcome institutional barriers (2003, p. 432). Danziger (2004, p. 109), on the other hand, defends the technology enactment framework. He argues that the separation of objective and embedded technology, the richer examination of social networks, and a more nuanced discussion of institutional theory are useful.

A second criticism is that Fountain's research agenda are not well linked to the previous literature in both public administration and IT (Bretschneider 2003, p. 741; Norris 2003, p. 418). Norris argues that e-government is not that different from the uses of other technologies in government. Thus, previous lessons apply to e-government (2003, p. 738). Grafton agrees with Bretschneider that the bulk of Fountain's work is "useful reformulation of conventional ideas" (2003, p. 412). He also disagrees with Fountain's claims about the originality of her framework.

The third criticism is Fountain's limited focus, as the book uses examples only from the US federal government. While Bretschneider (2003, p. 741) sees this as a problem, Grafton disagrees by stating that the discussion is applicable to state and local governments in the United States and elsewhere in the developed world (2003, p. 411).

## Limitations of the E-Government Concept

The first limitation of e-government is that there is still no standard definition of the concept. In other words, it is difficult to define what exactly e-government is. This difficulty stems from a couple of reasons:

First, e-government is a concept defined by the objective of the activity (transfer of government information and services among governments, their customers, and suppliers), rather than by the specific technology used, provider of the service/information, or clear-cut activities of the related actors. Hence, many definitions of e-government are rather loose and gloss over the multiple meanings e-government might have depending on the specific context, regulatory environment, dominance of a group of actors in a given situation, etc. (Yildiz 2007).

Second, e-government is one of those concepts that mean a lot of different things to a lot of different groups. For instance, Perri 6 (2001, p. 7) identifies different parts of e-government as e-service delivery, e-democracy, and e-governance. Rapid technological changes also make it difficult to "fully grasp the meaning, opportunities, and limits of the concept" (Prins 2001, p. 1). Therefore, there are many alternative definitions that each emphasizes a particular subsection of these relationships, such as those pertaining to issues of accountability, transparency, interactivity, participation, cost-effectiveness, etc.

Third, as if it is not enough for the real substance of the concept to be ambiguous, poorly defined and/or context dependent, e-government contains much hype and promotional efforts/literature as well, similar to the concepts of "knowledge management" or "management by objectives." Hype is often accused of raising expectations above realistic levels, preventing people from seeing what is going wrong in an area, and thus delaying corrective action. Hype is not always dysfunctional, though; it can be functional if it mobilizes interest and gives people a shared (although sometimes a quite distorted) vision to act upon.

Finally, one might ask how substantial a change is required to meet the criteria for a government technology project to be titled as an e-government project. For example, are static Websites or e-mail addresses of public managers enough or is some level of interaction required? Layne and Lee (2001) answer this question with their stages of e-government growth model. Projects at any of these steps could be defined as e-government projects.

A critically important question for this study is to explain how the theory and practice of e-government fits into the larger context of public administration. The most obvious theoretical connections between the public administration and

e-government literatures are in (1) the administrative reform, reinventing government, and new public management literature, (2) network theory and especially its variant/subset of "policy issue networks", and (3) institutional theory of organizations. It is beneficial to briefly review these literatures here and point out their connections with e-government theory and practice.

## Conclusion: Future of E-Government Studies

Over the years, service expectations of the users of e-government information and services have changed. In addition, e-government service standards have also evolved from government agency Websites to government portals that centralize and customize electronic service delivery by government. Today, the questions of "what is next?" or "what is the next big thing in e-government studies?" increasingly come to mind. There are several answers to this question about the future of e-government:

First, e-government service standards evolved over time from government agency Websites to central government portals, and simultaneously from Websites to mobile applications, and finally from mobile applications to now social media platforms. Today, the increasing use of social media platforms for providing government information and services online is an important trend in e-government studies.

Secondly, big questions of e-government are proposed by some researchers in order to take stock of e-government studies so far, to encourage thinking "out of the box," and to determine potential venues for further contributions. These big questions for e-government research are listed as follows: (1) How can e-government studies be better connected to and grounded in the mainstream public administration research? (2) How can e-government studies be more multidisciplinary and comparative? (3) How to better measure and evaluate e-government performance and results? and (4) How to produce novel and more usable concepts, models, and theories in e-government research? (Yildiz 2012)

A third direction for future e-government studies is the application of some new technological developments to e-government applications. Some of these new technological developments and applications can be listed as big and open data, Internet of things, and data visualization

A fourth and final topic is how to deal with the implementation problems of e-government projects. Some of such challenging problems of e-government implementation can be listed as the issue of digital divide, government surveillance, and the resulting need for the protection of the privacy of personal information within the context of e-government applications.

# Election Technologies and Voting Behavior

Samuel Adams and William Asante
School of Public Service and Governance, Ghana Institute of Management and Public Administration, Accra, Ghana

## Synonyms

Election identification technology; Election verification device; Voter registration technology; Voters biodata storage technology

## Definition

Biometric election technology generally refers to an automated device that is used to verify or recognize the identity of a voter based on physiological or behavioral characteristics. Some of these characteristics include fingerprints, facial images, and iris and voice recognition. In the Ghanaian case, the technology was used for voter registration and verification. The voter registration phase captured the biographical data, fingerprints, and photograph of each voter; and then the verification is followed during the Election Day when voters were verified before being allowed to vote.

## Introduction

Elections are an indispensable and foundational feature of modern democracy. Democratic elections require a state that is able, on the basis of preexisting records or through an ad hoc procedure, to compile a reliable voters' list. This important process often eludes developing countries as they demonstrate persistent difficulties in registering voters and establishing their identities. These difficulties emanate from the fact that no trustworthy system of national identification exists (Akpan and Adagba 2018).

In Ghana, election reform is not a recent phenomenon but has been part of the electoral process

since the commencement of the Fourth Republic in 1992. Ghana's election management body (EMB) known as the Electoral Commission (EC) has initiated steps to build confidence in the electorate after the faulty 1992 elections that resulted in the boycott of the parliamentary elections by the opposition parties. Prior to the 2000 and 2004 elections, photo ID cards had been issued; but the unique feature in 2004 was that aside from the provision of a photo ID card, voters had their photographs embossed against their biographical details on the main register. This helped to reduce impersonation and double voting and was continued in subsequent elections, though not without controversy, until 2012 when the biometric system for voter registration and verification (BVRV) was introduced. Measures were however introduced to make the biometric reform operational, leading to the replacement of the existing Public Elections Regulations otherwise referred to as Constitutional Instrument (CI) 15 which had governed public elections since 1996. The new law CI75 gave legal effect to the introduction of the biometric system, resulting in the popular mantra by the EC "No Verification No Voting" (NVNV). Despite the promising nature of the BVRV in Ghana's elections, one key challenge has been the EC officers' lack of consistency in applying the NVNV law which led the major opposition party, the New Patriotic Party (NPP) to contest the outcome of the 2012 elections in court.

The introduction of biometric technology (BT) for identification and verification in Ghana's elections has also received attention in the extant literature but not much on the experiences of voters with BT in the 2012 and 2016 elections. This reason provides a basis for this entry to identify whether the introduction of the BVRV influenced the voting decision and trust in the EC. In the sections that follow, the entry looks at the connections between election technology and election management and election technology and voter turnout. This is followed by the BVRV technology and voter experience and turnout, then the perceptions of trust in the EC and election outcome, and then finally a conclusion is drawn.

## Election Technologies and Election Management

For many countries around the world, the application of technology is part of an attempt to redress electoral anomalies such as fraud, rigging, and impersonation. The International Institute for Democracy and Electoral Assistance (IDEA) observed that in 2014, 38 low- and middle-income countries used biometrics to register voters, and the number continues to rise. Specifically, different kinds of biometric infrastructure have been used in Zambia, Nigeria, Uganda, Mongolia, Fiji, Bangladesh, Ghana, Mali, Kenya, Cameroon, Sierra Leone, Mozambique, Zambia, Malawi, Rwanda, Senegal, and Mauritania (IDEA 2017).

Effah and Debrah (2018) in a study of Ghana report that for BVRV to be effective in delivering credible elections, it should not depend solely on the technology but also on how registration centers are able to connect with the electronic national register. Similarly, Dorpenyo (2016) reported the challenges of BT in Ghana's 2012 elections with respect to technical communication, and Boateng and Akaba (2015) conducted a postmortem to identify BVRV's benefits and drawbacks. This entry contributes to existing knowledge by considering the implementation of BVRV in the 2012 and 2016 elections from the perspective of voters. A clear distinction exists between voter registration and verification regarding BT adoption in Ghana. Voter registration was phase one of the BVRV which began with identity checks, followed by the capture of biographical data, fingerprints, and photograph of each voter. Verification followed on Election Day when voters were verified before being allowed to vote.

## Election Technologies and Voter Turnout

Generally, voters turn out to vote when they know that their vote might decide the elections and also because of a feeling of civic responsibility. A study by Knack (1994) tested the assumption that unpleasant weather conditions (rain) on Election Day reduces turnout; however, the result

showed that rain does not significantly reduce the probability of voting. Farber (2009) sought to investigate whether making Election Day a national holiday increases voter turnout; the findings however revealed that an election holiday on its own does not necessarily increase voter turnout. Other studies on voter turnout consider the relationship between the closeness of elections and voter turnout (Shachar and Nalebuff 1999). However, the effect of election technologies on voter turnout is an area that has not received much attention in the literature. Mugica (2015) observes that in automated elections, voters from all age groups consistently report that it is easier to vote electronically than with pen and paper. In addition, touchscreens facilitate voter turnout for the people with disability and the illiterate who can simply touch the picture of their candidate's face or the color of their party with a finger.

## BVRV Technology and Voter Experience and Turnout

This section of the entry discusses the experiences of voters with the BVRV technology and whether it encouraged them to turnout to vote. An interaction with a section of the voters in Ghana revealed that the BVRV's introduction in the 2012 election encouraged them to vote because it was a new technology and they wanted to experience how it works. On the other hand, in 2016, the biometric technology did not serve as a motivator. People went to vote because they felt it was their civic responsibility to do so. Furthermore, some of the electorates pointed out that in 2012 when the biometric technology was initially introduced, challenges such as false acceptance that is allowing an unauthorized voter permission to vote, false rejection that is incorrectly rejecting an authorized voter, and then the failure to enroll or recognize voters due to machine error were encountered during voting (Magnet 2011), although the process was smooth and time spent was minimal. These experiences suggest that though biometric technology has not always performed optimally, it has been crucial in minimizing double voting, impersonation, fraud, and rigging in election management. It is important to highlight that it was not all voters that experienced difficulties; there were many of them that did not have problems at all, particularly the educated urban dwellers. Again, further interaction with a section of voters suggested that majority had confidence in the introduction of the biometric technology in the 2012 election and thought it will produce one of the most credible elections, but the end of that, election had to be debated in court, for the court to give a verdict before the dust settled. This supports the argument that no single biometrics is expected to meet the requirement of completely eliminating fraud and manipulation, cementing the argument that the occurrence of errors with biometric election technology is likely.

Some voters recount how in 2016 the biometric technology encouraged them to vote because a lot of education went on and people were better informed. This gave them a higher confidence in the elections that it will be free, fair, and transparent. The experiences and observations of the electorates clearly indicate that while some of them were encouraged to go and exercise their civic responsibility because of the introduction of the BVRV technology, and the assurance it gave them as ensuring a free, fair, and transparent elections, others, particularly the uneducated, felt disadvantaged and needed assistance. A high percentage of the Ghanaian population are found in the rural areas, and this is where most of the illiterate population also reside. With very little education by the EC in those areas, majority of the populace in those bracket (uneducated and rural) had difficulty exercising their civic responsibility of voting.

## Perceptions of Trust in the EC and Election Outcome

The issue of whether the introduction of the biometric election technology has affected voter trust in the EC and election outcomes needs to be assessed in terms of the general trend of trust in the EC from 2002 to 2014, based on Afrobarometer data (see Afrobarometer 2016). Two trust trends were identified. The first trend shows that from 2002, 41% of respondents had little or no trust in the EC, but this fell in 2005 to

21% with about 75% trusting the EC, which could be attributed to the innovations introduced such as embossing the photographs of voters against their biographical details in the main register in the 2004 elections. In 2014, however, the results show this figure reduced to about 40%, due to the inefficiencies in conducting the 2012 elections. A section of Ghanaian voters revealed that even with the introduction of the BVRV, there were incidents of electoral fraud, making some voters infer that the EC was being politically influenced. Other voters in Ghana also argued that the excessive delay by the EC in the final declaration of the results (referring to election 2016) even after all the media houses had collated about 95% of the results from the 275 constituencies made them suspicious about the independence of the election management body. Electorates read various meanings into this conduct of the EC; however, the mere delay of declaration of election results does not give enough grounds to conclude about the EC's lack of independence. A lot more robust evidence needs to be unearthed to arrive at such conclusions.

Again, a general observation of the 2016 presidential and parliamentary elections in Ghana indicated that many of the electorates agree to have some trust in the EC. This is because major stakeholders agreed on the outcome of the elections, with both domestic and international election observers describing it as free and fair – unlike the contested election results in 2012. In addition, some voters clearly pointed out that they have trust in the EC to conduct credible elections because political parties' representatives and the media are given the opportunity to enter the EC's strong room (where the elections are collated) to monitor the results of the elections. Finally, although many Ghanaians as a result of the introduction of the BVRV have their trust increased in the EC and election outcome, it is important to suggest that there is still greater room for improvement.

## Conclusion

This entry examined the experiences of voters with election technologies such as the biometric system for voter registration and verification (BVRV), as well as whether such technology affected both turnout and trust in Ghana's 2012 and 2016 elections. The discussion so far has shown that the introduction of BVRV influenced the turnout for both the educated and the uneducated. While most of the former were eager to experience this novel approach, the same could not be said of the latter. Additionally, there was no appreciable change in the perception in the trust for the operations of the EC. Finally, the entry again reveals that the new technology did not take into consideration population diversity, assuming that citizens have the same capability, resulting in the marginalization and neglect of a large section of the populace.

The issues highlighted in the entry leads to some recommendations for policy makers, researchers, and students of elections. First, there is the need for educational campaigns on the new technology to improve adoption and trust in the EC. Second, population diversity has to be taken into consideration in the implementation of the new technology to enhance voting behavior. Finally, the EC and other stakeholders need to encourage wider consultations and broader community participation when new technologies are introduced for effective election management. The diverse population, inequalities, and different capabilities should be factored into implementing new and existing election technologies in order for the electorate to take ownership of the election process.

## Electoral Governance

Mahbubur Rahman
Department of Political Science and Sociology, North South University, Dhaka, Bangladesh

### Synonyms

Electoral integrity; Electoral management bodies (EMB); Electoral process

### Definition

Electoral governance refers to the set of institutions and activities that determine and regulate the rules, management, and adjudication of electoral processes.

### Introduction

Elections are common phenomena in many countries, but electoral governance is not so widely understood. The meaning of electoral governance is often equated with electoral administration (Torres and Diaz 2014). However, this process entails more than what is commonly known as election administration. The core functions of election administration, for example, are (a) determining who is eligible to vote, (b) receiving and validating the nominations of electoral participants (for elections, political parties and/or candidates), (c) conducting polling, (d) counting the votes cast so that the election result reflects the will of the voters, (e) tabulating the votes in accordance with the electoral system so that the winners can be identified, and (f) running a credible organization so that the legitimacy of the election is not compromised by the actions of those conducting the election (Catt et al. 2014). Electoral governance, on the other hand, refers to a wider set of activities that creates and maintains the broad institutional framework in which voting and electoral competition take place (Mozaffar and Schedler 2002). It involves election law, election procedures, district boundaries, voter registration, registration process for political parties and candidates, media coverage, campaign finance, procedures in the election day, procedures after closure of polls, announcement of results, and performance of election officials (Tarouco 2014). All these aspects are handled by the institutions of electoral governance, what Mozaffar and Schedler call *rule making*, *rule application*, *and rule adjudication* (Mozaffar and Schedler 2002; Hartlyn et al. 2008).

Research on electoral governance is recent. The subject first gained importance during the *Third Wave* of democracy (Huntington 1993) when there was a growing concern about the credibility of the electoral results of new democracies. The pioneers of this subject rightly pointed out that electoral governance – construed as a set of rules and institutions that frame the electoral contest – shouldn't be overlooked as a variable in studies of democratic transition and consolidation (Elklit and Reynolds 2000; Mozaffar and Schedler 2002). For only high-quality elections can lead to democratization (Bogaards 2013).

The purpose of this chapter is to provide a concise overview of the role that electoral

governance plays to ensure quality elections. It begins with a discussion of theoretical perspectives that inform our understanding of electoral governance as a complex process that involves a wide range of actors, norms, and authorities. It then turns to an overview of the cycle that encompasses the whole gamut of electoral process. Finally, it concludes with an exposition of how electoral governance affects the quality of election.

## Theoretical Perspectives

The concept of electoral governance has been usefully defined by Hartlyn et al. (2008) as "the interaction of constitutional, legal, and institutional rules and organizational practices that determine the basic rules for election procedures and electoral competition; organize campaigns, voter registration, and election-day tallies; and resolve disputes and certify results" (Hartlyn et al. 2008).

Sarah Birch (2011) has suggested that good electoral governance is necessary (if not sufficient) conditions for free, fair, and meaningful elections for three reasons: First, electoral administrative bodies have enabling function, as they establish the practical framework in which a credible election can take place. Second, they have a supervisory function, in that they monitor the activities of other actors in the electoral process and identify malpractice. Third, they have an education and communication function through which they inform the citizenry as to how the electoral system in the state operates and seeks to build confidence in the conduct of elections. Where any of these functions is comprised by partisan's manipulation, she says, "the quality of electoral administration plummets" (Sarah Birch 2011).

Indicating the daunting nature of electoral governance, Pippa Norris (2015) has pointed out that "electoral governance involves a complex set of constitutional provisions, legal statutes, and administrative procedures established to regulate many specific dimensions of competition throughout the electoral cycle, including the demarcation of constituency boundaries; the rules governing political finance and party funding; the legal status, funding, and registration of candidates and political parties; the regulation of the news media, political advertising, and campaign broadcasts; the provision of gender quotas and special arrangements for minority representation; and the process of dealing with election complaints and dispute adjudication" (Norris 2015).

A comprehensive electoral legal framework is indeed critical as a foundation on which electoral management bodies (EMBs) are established and determines the scope and nature of the work of such entities. The framework has multiple functions: it authorizes an EMB to administer elections in accordance with detailed guidelines. It is essential that this framework is structured so as "to be unambiguous, understandable and transparent, and should address all components of an electoral system necessary to ensure democratic elections" (International IDEA 2002). It should also ensure a level playing field for political parties and candidates, as well as transparency and accountability throughout the electoral process.

It is important to mention that *constitutional or legal arrangements*, which provide the broadest context for electoral integrity, do not alone determine the character of electoral governance. For "electoral governance is also shaped by the role of the core administrative agencies exercising authority directly over the implementation of electoral laws and procedures, commonly known today as *electoral management bodies* (EMB), as well as a wide range of administrative agencies responsible for regulating specific dimensions, such as boundary delimitation, political finance, and campaign communications, all of which are embedded within the broader constitutional arrangements" (Norris 2015). One of the key questions arising from this distinction, according to Norris, is whether EMBs can be designed to be effective in strengthening the quality of elections, even in autocracies that have unfavorable constitutional conditions (Norris 2015).

According to Mozaffar and Schedler (2002), electoral Governance operates at three levels: (a) rule making, (b) rule application, and (c) rule adjudication. Rule making involves designing the

basic rules of the game; rule application involves implementing these rules to organize the electoral game, and rule adjudication involves resolving disputes arising within the game" (Mozaffar and Schedler 2002).

While detailing the three levels of electoral governance, Mozaffar and Schedler (2002) have noted that at the level of *rule making*, "electoral governance involves the design of institutions that define the basic framework of democratic elections. Rules of electoral competition and rules of electoral organization configure this framework." At the level of *rule implementation*, "electoral governance coordinates the tasks of diverse personnel and organizes the execution of a complex array of interdependent activities to establish the stable institutional basis for voting and electoral competition." And at the level of *rule adjudication*, electoral governance involves mediation and settlement of disputes arising out of the process and the results of voting and electoral competition. Settling disputes over election results is a vital function of electoral governance. Rule adjudication prominently involves the authoritative resolution of disputes that arise from ambiguities in complex election rules and operational problems in their implementation (Mozaffar and Schedler 2002) (For details, see Table 1).

It's worth noting that in established democracies, electoral administration is not usually seen in dispute (though exceptions are there, as it happened with Florida vote count dispute in the USA in 2000), but governments in fledgling democracies more often attempt to manipulate elections through various means including the designs of electoral management bodies (EMB). Pastor (1999) proposes five ways to classify electoral bodies: (a) an electoral office with government supervision, (b) an electoral office supervised by a judicial body, (c) an electoral office accountable to parliament, (d) a multiparty electoral office, and (e) an independent electoral office. For safeguarding internal governance, countries in democratic transition therefore prefer independent bodies to oversee proper electoral conduct. These bodies are responsible for ensuring the integrity of the electoral process during three major stages: pre-election period, election days, and post-election period.

**Electoral Governance, Table 1** The three levels of electoral governance

| Levels | Elements |
|---|---|
| 1. *Rule making* | |
| Choosing and defining the basic rules of the electoral game | - Formula |
| | - District magnitude |
| (a) Rules of electoral competition | - District boundaries |
| | - Assembly size |
| | - Electoral timetable |
| | - Franchise |
| (b) Rules of electoral governance | - Voter registration |
| | - Party and candidate registration |
| | - Campaign financing and regulation |
| | - Election observation |
| | - Ballot design |
| | - Polling stations |
| | - Voting, counting, and tabulating |
| | - Election management bodies |
| | - Dispute settlement authorities |
| 2. *Rule application* | - Registration of voters, candidates, parties |
| Organizing the electoral game | - Registration of election observers |
| | - Voter education |
| | - Electoral organization |
| | - Voting, counting, and reporting |
| 3. *Rule adjudication* | - Admission of complaints |
| Certifying election results and resolving disputes | - Processing of cases |
| | - Publication and implementation of rulings |

## Aspects of Electoral Cycle

Pippa Norris (2015) has pointed out that the idea of an "electoral cycle" has become the "gold standard" for the international community seeking to strengthen the capacity of election management

bodies and to invest in long-term sustainable development (Norris 2015). Indeed, the breakdown of an election into its constituent parts has proved useful not only for election administrators who must match human, financial, and logistical resources to each part of an election but also to election observers who can develop checklists to evaluate the conduct of each element. Although some categorizations may vary, a list of key areas to be taken into consideration in this evaluation could include:

- Legal framework for elections
- The electoral system and boundary delimitation
- Election management
- The media
- Parties, candidates, and campaigns
- Political finance
- Gender equality
- Equality of minorities, persons with disabilities, and marginalized groups
- Voter education
- Voter registration
- Voting procedures
- Vote counting and aggregation of results
- Electoral dispute resolution

To operationalize the core notion, the electoral cycle is deconstructed into a series of 11 sequential steps by Pippa Norris (2015) (see Fig. 1). This approach acknowledges that flaws can arise at any stage of the process.

## Electoral Governance and the Quality of Elections

Elections may occur with greater or lesser degree of fairness and transparency. In recent times, there has been considerable attention by scholars and practitioners to the question of how electoral governance affects the quality of elections, especially as defined in terms of confidence in the electoral process and outcomes (Elklit 1999; Elklit and Reynolds 2002; Mozaffar 2002; Mozaffar and Schedler 2002). Election quality has been described as "the extent to which

**Electoral Governance, Fig. 1** Steps in the electoral cycle. (Source: Norris 2015)

political actors see the entire political process as legitimate and binding" (Elklit and Reynolds 2002). It is often used interchangeably with electoral integrity.

There are several factors that impact on the quality and integrity of elections. Those are the (a) legal framework, (b) electoral system, (c) technical efficiency of electoral management authority, (d) relative autonomy of the electoral agency from interference by other organs of the government and the ruling party, and (e) degree to which electoral processes, decisions, participation, and outcomes are insulated from manipulation, corruption, and violence (Alemika 2007). Sakuntala Kadirgamar-Rajasingham (2005) has pointed out that "to determine that a given election is free and fair, calls for scrutinizing not just the laws that provide for elections and the election event, but the run-up to the elections as well. The scrutiny of a process inevitably calls for more than a documentation of the chronology of events leading up to the elections – it calls for a scrutiny of the actions – the behavior of all actors involved in the electoral process and a review of the outcomes" (Kadirgamar-Rajasingham 2005). She also notes that "the scrutiny of the legal framework governing elections should address whether the provisions they make for registration, pre and post election activities, complaint procedures, voter information and education, election preparation are fair, open and transparent. The scrutiny of the legal framework governing elections must also look at the provisions it makes for the election itself - i.e. the ability to campaign freely, the polling procedures and arrangements, the vote count and the settlement of disputes as these are all a part of the electoral process" (Sakuntala Kadirgamar-Rajasingham 2005).

Sakuntala Kadirgamar-Rajasingham further maintains that the government of the day – the political parties, armed forces, police, election adjudicating bodies, civil society, and organized and unorganized groups – must accept and support the process and not undermine it through violence, intimidation, or any other unlawful means. There is no denying that elections can be undermined by state actors as well as by non-state actors, and therefore we need to take all of them under considerations while trying to ensure free and fair elections.

It is worth mentioning that for a credible election, it is mandatory to create an autonomous, professional, and competent election management body. An independent election management body has numerous responsibilities including determining voter eligibility and registering eligible voters, polling, tabulating votes, regulating campaigns, educating voters, and resolving electoral disputes. A legitimate and credible election management body is especially important in countries with a recent history of social division and political violence (IDEA 2012).

As the demand for credible elections increases, scholars are focusing more on autonomous or independent election commissions (Pastor 1999; Elklit 1999: Elklit and Reynolds 2002; Gazibo 2006; Hartlyn et al. 2008; Birch 2008; López-Pintor 2000; Makulilo 2011). Elklit and Reynolds (2002) have argued that legal independence of electoral management bodies (EMB) does not always translate into substantive independence and that the challenge in designing electoral governance is to find a means of guaranteeing that those in charge of administering elections are in fact independent-minded and are sheltered from inappropriate pressures and inducements. From this perspective, it can be said that minimum two factors are extremely important for ensuring effective electoral governance. First, incumbent has to demonstrate all along their commitment to the principle of noninterference in the electoral process. Second, the officials associated with electoral management bodies should be independent-minded, professionally competent, and committed to the fundamental guiding principles of a neutral administration (Rahman 2017).

As for determining the quality of elections, the scholars are still debating on issues related to the "quality of election" and how to "measure" this quality. According to Omotola (2009), three issues that are central to determining the democratic quality of elections are competition, participation, and legitimacy. These indicators are further operationalized to clarify relevant measures that go into identifying free, fair, competitive, and credible elections (Lijphart 1997;

Lindberg 2004). The types of problems that can compromise the quality of election include manipulation of rules, discretion in voter registration, repression and intimidation of competitors, the biased distribution of resources, the exclusion of groups of citizens, fraud in the vote count, and even operational mistakes due to inefficiency or negligence (Tarouco 2016).

Pippa Norris therefore suggests that "electoral assistance and monitoring should not be focused purely upon election day, or even on the short-term period of the official campaign. Instead, each election should be understood as a cyclical process involving a long series of sequential steps" (Norris 2015).

Elklit and Reynolds (2005) have proposed a very comprehensive model to the measurement of election quality. Their measurement model includes legal framework, electoral management, constituency demarcation, voter education, voter registration, access to and design of ballot paper, party registration and candidate nomination, campaign regulation, polling, counting and tabulation of votes, resolving election-related complaints, verification and certification of final results, and post-election dispute resolution procedures. It is implied that the integrity or quality of election can be affected by decisions at each of these phases in the electoral process.

Gary Bland, Andrew Green, and Toby Moore have suggested another model, namely, "Election Administration Systems Index" (EASI) which, they claim, is a practical, transparent, and sustainable tool for measuring the quality of elections in the developing world (Bland et al. 2013). The proponents of EASI point out that "for any electoral system to be effective, three facets – (1) open participation, (2) fair competition, and (3) adherence to process – have to be maintained not only on voting day, but also in the pre-election and post-election environments" (RTI International 2011). Accordingly, the index provides for the examination of elections across three periods of the electoral cycle: before, during, and after the vote. The pre-election period includes the registering of voters, for example. The act of voting includes election-day administration, among other aspects, while the post-election period includes considerations such as procedures for the resolution of election disputes" (Bland et al. 2013).

EASI, as its proponents explain, generates scores at three levels. The first are the nine sub-indices slotted into a three-by-three matrix, and these allow for assessments across dimensions and time. The second set of six scores is the average of the scores for each dimension and period of time. Third, EASI also produces a single country's score (for identifying electoral strengths and weaknesses which may also serve for comparative assessments) (Bland et al. 2013). EASI could be applied worldwide as effective tool for a nuanced evaluation of the electoral governance.

## Conclusions

There are six dimensions of electoral governance that can improve the trust in the fairness of electoral processes and thereby increase the quality of elections: *first*, independence from executive branch keeps the government away from the electoral management, reducing concerns about manipulation against opposition competitors; *second*, centralization of management of all electoral processes in only one institution keeps away the local bosses from the electoral management, reducing concerns about favoring local elites; *third*, bureaucratization brings professionalization to electoral institutions and gives transparency, certainty, and predictability to the electoral processes, allowing the development of expertise and impersonality; *fourth*, delegation of electoral management to nonpartisan actors keeps away the political parties from the electoral governance, reducing concerns of manipulations favoring major parties; *fifth*, specialization of different institutions in electoral management and electoral dispute resolution split powers and allows horizontal accountability; and *sixth*, regulation of electoral governance in the Constitution, beyond the ordinary laws, reduces discretion, avoiding ad hoc decisions (Tarouco 2016).

To conclude, electoral governance is a complex and gigantic exercise, which depends on a multiplicity of actors/stakeholders (such as

political parties, candidates, voters, election management bodies, law enforcement bodies, the media, adjudication bodies, etc.). Among them, the role of the election commission is certainly critical and substantial, since it influences the quality of elections significantly. Indeed, the conduct of election commission directly bears on the quality of the electoral process from the efficiency and accessibility of voter registration to the accuracy of the final vote tally. The neutral and efficient role of the election commission is therefore extremely critical. It is almost a consensus among the scholars and practitioners that an *independent* election commission is necessary for high-quality elections, which, by implications, builds trust and helps improve the chances for legitimacy, systemic stability, and democratization. For effective electoral governance, both the formation and functioning of the election commission have to be transparent and trustworthy, and all the key stakeholders have to remain responsible for their respective roles.

# 1994 Electoral Reform in Japan: Background, Process, and Impact on Governance and Public Policy

Etsuhiro Nakamura
Faculty of Policy Studies, Aichi Gakuin University, Nisshin, Aichi, Japan

## Synonyms

Electoral reform; Factional politics; Party-centered election; Personal vote

## Definition

The causes and processes of Japan's 1994 electoral system reform and its consequences.

## Introduction

In Japan, four bills concerning electoral reform were passed in 1994, which finally changed the Japanese political landscape dramatically. In this section, the background of this reform, the process of the enactment of the laws, and the impact of the reform on governance and public policy will be discussed.

In the first part of the section, outline of the features of Japanese politics before the electoral reform is presented. Japan has adopted the single nontransferable vote multimember district (SNTV-MMD) system with moderate district magnitudes since 1925. SNTV-MMD, *Chusenkyoku* in Japanese, is the system where typically three to six seats were assigned to a district. Voters cast their vote by handwriting the name of one candidate. The candidates were ranked by the votes they got and elected if their ranks were within the number of seats assigned to the district. It is expounded upon why this system gives the Liberal Democratic Party (LDP) politicians the incentive to cultivate the personal vote and develop factions within the party.

In the second part, the process of the electoral reform is described. The triggering event was the Recruit money-for-influence scandal occurred in 1988. It is explained how this event finally resulted in electoral reform.

In the final part, the impact of the electoral reform on governance and public policies is described. The reform significantly strengthened the power of party leaders and the prime minister. In addition, public policy also changed to reflect the preference of urban voters because electoral reform partially resolved malapportionment. Simultaneously, reform of administrative institutions occurred such as decentralization and municipal mergers, which were the basis of the traditional distributive politics.

E

## Electoral Politics Under the SNTV-MMD

SNTV-MMD had been used for the elections for the Japanese House of Representatives since 1925 until 1993 except for just one election in 1946. The introduction of the SNTV-MMD was said to be the compromise among the national parties at 1925. Since then, SNTV-MMD has strongly affected the development of Japanese politics and postwar LDP dominance. Under this system, parties that intended to have the majority of seats need to endorse several candidates in a district. In addition, the vote was not transferable, which means candidates from the same party fought each other for votes. The vote share for assuring the win is much smaller than the first pass the post-single member district (SMD).

This electoral institution had several effects on the strategy of candidates and parties. In this chapter, two points will be explained: SNTV-MMD encouraged so-called personal vote backed up by *Koenkai* and decentralized structure of LDP which internally have several factions. (For the more detailed comparison of the Koenkai and decentralized Factional politics before and after the electoral reform, see Krauss and Pekkanen 2010.)

First, under the SNTV-MMD, the electoral value of the party endorsement was not so high because there are usually several LDP candidates

within the same districts. For the compensation for this weakness of the party label, candidates' personal support organization, *Koenkai*, has been developed. Activities of *Koenkai* were said to become first prominent in the late 1950s, just after a few years since LDP was formed in 1955 (Kitaoka 2008). LDP originally utilized personal networks in rural agricultural areas as a major campaign instrument. However, the ties among people got weaker as the area economically developed and urbanization progressed. Therefore, LDP candidates began to develop *Koenkai* in suburban of metropolitan areas during the high-growth period in the 1960s because LDP candidates tried to compensate now weakening local ties by making their own personal support groups. Another type of *Koenkai* was created by economic purposes, whose members were small business owners and board members of companies and basically had economic purposes, aiming to join the distributive projects. Using survey research, the Associations for Promoting Fair Elections estimated the rate of persons who are the member of *Koenkai* (The number includes the Koenkais of both national and local politicians.). As shown in Fig. 1, the rate especially rose up during the 1970s when LDP's popularity declined due to the oil shock and scandals.

*Koenkai* provided several services for its members. Firstly, it provided recreational activities such as bus tours for sight-seeing. This type of recreational activities bonded the ties among members and important activities even now. Secondly, candidates tried to respond petitions for private matters, such as the job hunting for members' family. Thirdly, the most important activities were the responses for petitions for local economic matters, such as the social infrastructure development, subsidies for local business and agriculture, and government approvals and licenses for local business activities.

Huge cost of maintaining *Koenkai* had been the source of money scandals. Under the SNTV-MMD era, it was said that maintaining one large *Koenkai* required a hundred million yen per year and senior legislators had several *Koenkai* (Ishikawa and Hirose 1989. For the overview of the history of money politics in Japan, see Carlson and Reed 2018). The money for maintaining them was legally and/or illegally provided by private companies in reward with the help for their business.

From a larger viewpoint, Ramseyer and Rosenbluth (1993) pointed out that this *Koenkai* strategy related to the coordination problem. In order to efficiently maximize the seat share under the SNTV, LDP should nominate an appropriate number of candidates and divide votes evenly to them. However, LDP could not have the party organization strong enough to tell its supporters which candidate they should vote for. Therefore, candidates had to divide their votes with a decentralized manner. One answer to this coordination problem was *Koenkai* and specialization on specific policy areas. LDP politicians usually have their own expertise such as agriculture and road construction. These policy areas are the territories of LDP legislators, and *Koenaki* were formed with the help of these sectoral associations of their expertise. By assuring their own territories, LDP

**1994 Electoral Reform in Japan: Background, Process, and Impact on Governance and Public Policy, Fig. 1** Estimated rate of Koenkai Members. (Source: General election survey by the Association for Promoting Fair Elections)

politicians secured a portion of votes, which helped the equalization of vote share among LPD candidates.

In addition to the distributive politics through *Koenkai*, another conspicuous effect of SNTV-MMD is the rise of factional politics and the decentralized power structure in the governing party. It is said that factional politics, which existed as early as the LDP formed, has been boosted under the SNTV-MMD and rapid economic development after war.

Factions in LDP were the group of legislators whose aim was to get the leader to be the prime minister. There are at least two reasons why most legislators participated in a faction. The first reason is electoral. Under the SNTV-MMD, the formal organization of LDP could not focus on a specific candidate to help her election. Thus, factions played an important role in electoral politics recruiting potential candidates, instructing them how to prepare elections and so on. Factions also provided financial supports for young candidates and campaign assistance such as the public speech of senior factional members. They also encouraged the LDP election headquarter to endorse the candidates and helped them even if they could not have the endorsement.

In addition to the help in elections, factions also assured the carrier of their members. Typical carrier path of LDP legislators during the SNTV era began with an ordinary member of a division of a policy research council in LDP. Then they experienced several important posts, such as a director of a division of a policy research council of LDP and a vice minister, and finally they became a minister after they got reelected fourth or five times. To follow the path, they needed supports by other legislators as well as the knowledge of their expertise. Factions assured the carrier by backing up the members, especially when a member of a faction was behind the promotion race.

The development of factional politics curbed the powers of prime ministers. Officially prime minister of Japan has full authority to appoint ministers. The authority was limited in fact, because prime ministers could not neglect the recommendation list from each faction. Therefore, ministers' loyalty and policy congruency to prime minister were also limited. Ministers are loyal to the head of their faction instead. In addition, bills should have been approved by the policy research council and the general council of LDP prior to the introduction to Diet. This custom was confirmed in as early as 1962 and still basically in effect since then. Therefore, it was sometimes referred as "strong party, weak government" phenomena. Although prime minister was powerful, the leaders of factions were so powerful as him that the LDP organizations were not amenable to them.

## Process of the Electoral System Change

In this section, I shortly describe the process of the electoral system change (see Ohtake 1997, Curtis 2000 for more detailed explanation). Electoral reforms in 1994 originated from the Recruit money-for-influence scandal that occurred in 1988. The scandal involved many LDP politicians, as well as some opposition party politicians. Ezoe, the chairman of Recruit Co., gifted the stock of the Recruit Cosmos, which was the affiliated company of Recruit, for increasing his influence on politicians. The scandal involved Prime Minister Noboru Takeshita, ex-prime minister Yasuhiro Nakasone, and other politicians who are/were at the center of power.

The Recruit scandal encouraged younger LDP politicians to recover the popularity of LDP by emphasizing the reform of the money politics. Especially these young politicians, including Yukio Hatoyama, considered the SNTV-MMD was the cause of the money politics, forcing them to engage distributive politics in their home districts. Thus, in 1999, the Political Reform Committee of LDP, *Gotoda committee* named after the committee chairman Gotoda Masaharu, proposed the reform of the electoral institution. The original idea was to introduce the SMD combined with the proportional representation. In Japan, severe restrictions of the campaign period and finance do not allow candidates to use extensive media campaign such as broadcasting huge amount of TV CF. Instead, candidates use

traditional "rally" as the major tool to campaign themselves. Therefore, the size of a district directly affects the amount of campaign funds. Thus, it is natural to introduce the single member district to set up lower-budget elections. However, the proposal of the idealists of such young politicians was not smoothly accepted in LDP. Although the electoral reform bills were proposed in the Diet, they were not enacted (see Table 1 for reference).

Ichiro Ozawa utilized the opportunity and set the agenda of the electoral reform too. Ozawa created a new faction and put forward the political reform after he failed to succeed to the largest faction in LDP. This strategy of Ozawa created conflict among LDP politicians, and Ozawa blamed some factions as anti-reformists.

Another key factor was the emergence of the Japan New Party. The Japan New Party was built by Hosokawa Morihiro, the former governor of Kumamoto prefecture, and did not have strong intention to reform electoral institutions originally. However, in order to keep the reformist image, they set the political reform as an important political goal. Politicians joined to the Japan New Party were not laymen in politics in fact, but they did not have strong district-level organizations. It was the advantage to reform electoral institution because the local district-level organization did not strongly resist to the redistriction.

| | | |
|---|---|---|
| 1988 | 27-Dec | LDP established the Political Reform Committee (Gotoda Committee) |
| 1989 | 23-May | LDP confirmed the Outline for Political Reform, which included the reform of the electoral institution |
| | 20-Jun | LDP established the Headquarter of Political Reform (Chairman Masayoshi Ito) |
| | 10-Aug | Kaifu administration started |
| 1990 | 18-Feb | 39th General Election |
| | 26-Apr | 8th Electoral System Council (advisory board to prime minister) reported to introduce a new electoral system. 300 SMD seats and 200 PR seats with 11 blocks |
| 1991 | 9-Jul | General Council of LDP confirmed the party-line vote for the three bills concerning the electoral system reform |
| | 7-Oct | Kaifu cabinet approved the three bills concerning the electoral system reform |
| | 5-Aug | Kaifu cabinet proposed the bills to Diet |
| | 30-Sep | The Special Committee on the Political Reform at the House of Representatives turned down the bills |
| | 4-Oct | Parties agreed to make a council on political reform of parties |
| | 5-Nov | Miyazawa administration started |
| 1992 | 22-May | Hosokawa build Japan New Party |
| | 26-Jul | 16th Election of House of Councilors |
| | 28-Oct | Ozawa built a new faction |
| 1993 | 2-Apr | LDP submitted bills that proposed SMD only system |
| | 8-Apr | Japan Socialist Party/ Clean Government Party submitted bills that proposed 200 SMD seats and 300 PR seats |
| | 28-May | The Special Committee on the Political Reform at the House of Representatives agreed to introduce a new electoral institution, which paid regard to LDP bills and JSP/CGP bills |
| | 16-Jun | Passage of the no confidence motion against Miyazawa Cabinet |
| | 21-Jun | Sakigake formed |
| | 18-Jul | 40th General Election |
| | 9-Aug | Hosokawa administration started |
| | 17-Sep | Hosokawa submitted bills that proposed 250 SMD seats and 250 PR seats |
| | 5-Oct | LDP submitted bills that proposed 300 SMD seats and 171 PR seats |
| 1994 | 28-Jan | Hosokawa and Kono, the president of LDP, agreed the compromise |

After Miyazawa cabinet failed to enact the political reform bills in 1993, Ozawa and his faction split the LDP and formed a new party, Japan Renewal Party, and approved no-confidence motion against Miyazawa cabinet. As the result of the 1993 election, neither LDP nor opposition parties had the majority of the House of Representatives. *Sakigake*, which was formed by the younger idealists of ex-LDP legislators and the Japan New Party, thus had the casting vote for making a new cabinet. In order to keep the reformist image, they cooperated with other opposition parties and build Hosokawa cabinet. The logic of the cooperation was the reform of money politics, blaming LDP was reluctant to reform its money politics. Although Prime Minister Hosokawa said he would resign the job if the political reform laws were not passed in 1993, difficult negotiation among parties continued, and the laws were finally passed in March 1994.

As for the electoral system reform, the basic framework for the reform was the same as the Gotoda committee has submitted to LDP and been rejected under the Kaifu government. The proposed electoral system was the mixed electoral system of SMD and party-list proportional representatives (PR). It is also called parallel voting system because voters have two ballots for two separate elections, SMD and PR, held simultaneously. Reformists did not intend to introduce PR only system. Party-centered politics, which was the original goal of the reformists, should have been attained if the closed list PR was introduced. However, the system was not popular when the House of Councilors used it (1983–1998) because candidates did not work seriously for parties during the campaign periods.

The ratio of the SMD and PR was the most difficult point to agree with because it affects the big impact on the seat share of elections. Therefore, LDP insisted that the ratio of PR should be small and the PR district should be 47 prefectures. On the other hands, small parties tried to enlarge the ratio of PR seats and insisted PR district be an entire country. After the difficult negotiation, the PR system with 11 geographically divided blocks was introduced.

Finally, in 1994, the discussion was ended with the compromise that 300 SMD seats and 200 PR seats with 11 PR districts. Redistricting could be the cause of great conflicts but was not determined then, and the law requested to make a special committee for the redistriction later. As of Dec 2017, the total number of seats is 465 as the results of several reforms of the law. The geographical distribution of 11 blocks and the number of seats for each block and prefecture as of Dec 2017 are depicted in Fig. 2.

On the other hand, reforms on political funds did not cause a serious conflict among major parties. According to the new law, political funds from private companies, labor unions, and other groups were more strictly restricted while public funds was newly introduced. The Japan Communist Party was at that time rich in funds and only one party which strongly resisted the introduction of public funds. The law said 250 yen per citizen, about total 3.2 billion yen, was distributed to parties according to their seat share in the Diet and vote share in national elections. Originally, the amount of the public funds was limited up to two thirds of the revenue of the previous year. This limitation was severe so that it was abolished next year.

## Effects of Electoral Institutional Reform

Because of the electoral institutional reform, Japanese election became more party-centered and policy-oriented. However, it was not clear during the 1990s and early 2000s. From the current perspective, voter-party relationship at that time was extremely unstable. After 1993, parties merged and dispatched frequently. The percentage of independents among voters tremendously rose as shown in Fig. 3.

However, election in Japan got increasingly party-centered since then. Figure 4 shows the ratio of voters who weight the party more than the candidate. As shown in the figure, the ratio increased especially in the 2000s. Contrary, the ratio of voters who weight the candidate more has been decreasing. (For more systematic analysis of party-centered election, see Maeda 2008.)

Adopting the concept of manifesto was one reason for the party-centered election too. After

the electoral reform, political movement occurred that insisted manifesto should be introduced emulating the United Kingdom. However, under the Public Office Election Law at that time, manifesto could not be distributed in the form of brochures. In 2003, the law was revised to allow candidates to distribute brochures, and the DPJ started the campaign that the voters should choose the party by comparing manifestos. Other parties followed the move of DPJ.

It is also notable that the electoral influence of *Koenkai* got weaker. As shown in Fig. 1, the estimated rate of membership gradually dropped after the 1990s. Partly the reason was economical: because of the longtime depression after the babble economy and companies saved membership fee. In addition, the national government reduced the amount of public works, which reduced the attractiveness of joining a *Koenkai* too. From the candidate viewpoint, it is also true that the role of *Koenkai* was less important in determining the electoral outcome than that under the SNTV-MMD era. The number of newly elected legislators was 77 in 2009 and 93 in 2012, which were

**1994 Electoral Reform in Japan: Background, Process, and Impact on Governance and Public Policy, Fig. 3** Ratio of independent voters. (Source: Monthly Opinion Poll by Jiji Press)

**1994 Electoral Reform in Japan: Background, Process, and Impact on Governance and Public Policy, Fig. 4** Which weight more, Party or Candidate? (Source: General Election Survey by the Association for Promoting Fair Elections)

much larger number than before. In both elections, the main theme of the elections was whether voters would approve the current governing party or not. In such elections, candidates who only have weak local personal organizations can collect floating votes by the name of their party. Although still candidates need *Koenkai* for their campaign purpose because the formal organization of LDP (and some other opposition parties) is weak, the era of *Koenkai-based* personal vote has ended, and the presidentialization of electoral politics started.

The premise of manifesto election is the centralization within LDP and government. In Japan, traditionally the leadership of prime minister had been limited. Instead, public policies were strongly influenced by the LDP expert legislators, *Zoku* giin in Japanese. *Zoku* giin, meaning the tribe legislator in Japanese, has deep knowledge and influence in particular policy areas. For example, the post and telecommunication tribe is the group of LDP legislators who experienced several important positions concerning the post and telecommunication policies in government and LDP. However, during the administrative reform occurred in the late 1990s, several reforms on administrative structure have been made to strengthen the prime minister's policy leadership. For example, staff organizations as well as the number of staffs directly reported to prime minister were strengthened. These reforms allowed prime minister to deprive the policy leadership from the LDP expert legislators.

Koizumi government utilized these new administrative structures. Prime minister Koizumi used the Council on Economic and Fiscal Policy, newly established staff organization for determining the fundamental policies for government, and set the fiscal framework first. Koizumi also neglected factions' recommendation lists for

ministers and virtually abolished the custom so that newly appointed ministers and other cabinet members were loyal to him. Using these strategies, Koizumi could decrease the distributive projects and advanced the reform of the fiscal decentralization and privatization of post office (see Kamikawa 2010 and Maclachlan 2012 for the leadership of Koizumi and privatization of post office).

The 2005 House of Representatives election revealed the power of the president of the LDP under the new electoral system. Koizumi proposed the privatization of post office. However, some LDP legislators strongly opposed the proposition because postmasters of small commissioned post offices had long supported LDP. The General Council of LDP, which has the authority to decide party-line votes for a bill, adopts the unanimous rule. Because some legislators strongly opposed to the bill, the General Council exceptionally made the decision by a majority for the privatization. In the Diet, the bill was rejected because 37 LDP legislators voted against the bill in the House of Representatives and 22 legislators did it in the House of Councilors. Although the 37 legislators included ex-ministers and leaders of factions, Koizumi called the election and did not endorse them. Moreover, he sends new and potent candidates against them. As the result, LDP gained a big victory in 2005 election, and almost half of revelers were not reelected.

This political event revealed two facts. First, the president of LDP did have a strong policy leadership now and it was difficult to resist it even if revelers contributed to the LDP a lot until then. Under the SNTV-MMD, they could run an election as independents, and their factions could help them during/after the election. However, now factions could not help the revelers. Second, voters really understood the fact that, under the SMD, the landslide victory occurred, and they could use the election to choose the next prime minister. Thus, in 2009 and 2012 elections, they strongly punished the governing party in turn.

The electoral institutional reforms encouraged the centralization of power to LDP president. With the administrative reforms occurred in the early 2000s, now prime minister does have a stronger power and policy leadership. Still, the policy council of LDP has strong influence on each policy area, and the LDP decision-making is basically a bottom-up style. However, Koizumi government showed that top-down decision-making was possible if a prime minister was willing to do so. In addition, the result of the election changed power structure of LDP itself. Koizumi did not have a strong factional support and thus had difficulties to penetrate his leadership in the first half of his government. However, after the election in 2005, his power became strongest, and nobody could challenge him (Kamikawa 2010). Now LDP legislators understood the power of the president of LDP although still only Koizumi and Abe showed strong policy leadership (Krauss and Pekkanen 2015).

Traditional distributive policy of LDP changed too. First, because electoral reform partially resolved malapportionment, LDP got more sensitive to the preference of urban voters. During the 1990s, the LDP government provided large amounts of public works in order to recover the depression after the bubble economy. However, it was very unpopular especially among urban voters. Therefore, from the 2000s, the amounts of public works have quickly reduced under the Koizumi government. Currently, even LDP cannot neglect urban voters, where the popularity and votes of LDP are especially volatile.

Institutions that traditionally supported LDP's clientelistic politics have been changed too. For example, the number of local politicians is dramatically reduced due to the municipal mergers. Once, local politicians were considered an important campaign resource for LDP. However, it was so costly maintaining large number of municipalities and politicians that the national government encouraged municipal mergers and the number of municipalities reduced to about half. Decentralization has also been progressing. Traditionally, the important role of LDP legislator was to bring the pork projects into their home district utilizing the large fiscal transfer (Scheiner 2005). However, decentralization weakened the local-central fiscal ties and reduced the clientelistic relationship. These phenomena occurred, from a larger perspective, because the SNTV-MMD was abolished and incentive structure has changed.

## Conclusion

In this chapter, the 1994 Electoral Reform in Japan is explained, focusing on the background, its process, and electoral, administrative, and policy impacts. The 1994 electoral reform had big effects on Japanese politics. However, still party system is volatile. In addition, although 20 years have already passed since the mixed electoral system was introduced, still electoral reform is ongoing. Especially, in this chapter, the disparity of values of votes between constituencies is not mentioned, which is a cause of ongoing electoral system reforms. These problems should be targets of future scholarly research.

## Definitions

| | |
|---|---|
| Single-member district (SMD) | This refers to an electoral system with which in each district, only one candidate, who obtains the largest number of vote, is elected to gain a seat. |
| Proportional representation (PR) | This refers to an electoral system with which the number of legislative seats allocated for political parties are determined in proportion to the total number of votes gained by those parties. |
| Singe-non-transferable vote (SNTV) | This is an electoral system which is used in multimember districts. Voter casts a vote for candidates, and those who win a larger number of votes win the seats. |

## Introduction: The "Hybrid" Electoral Systems

The Japanese political institutions are characterized as being "hybrid" (Kono 2012). The electoral systems are not an exception. They create a unique structure of governments across the national and local levels: the national and local elections are conducted under different electoral rules, which juxtapose the national-level parliamentarism with the local-level presidentialism. For the national government, the House of Representatives (the lower house of parliament) is elected by the electoral system combining single-member district (SMD) plurality system and proportional representation (PR), whereas the House of Councilors (the upper house of parliament) is elected by the electoral system combining a single non-transferable vote (SNTV) and proportional representation, the half of which are elected every 3 years. Prime minister as a chief executive is elected from a majority party or a coalition of parties comprising a majority status at the lower chamber.

On the other hand, different combination of electoral rules is adopted to elect local governments. Prefectural governors and mayors are elected by plurality rule, under which voters directly elect their local chief executives. Local legislators are elected by plurality rule based on different-sized districts. In other words, chief executives and legislators are elected separately for local elections. It means that the structure of local governments is based on a so-called dual representative system, which is functionally equivalent to presidentialism. In other words, parliamentarism at the national level and presidentialism at the local levels coexist in Japanese political system. This is a product of a unique combination of different electoral systems between different levels of governments.

The following sections first explains how the national and local governments are elected, then low electoral turnouts in both elections, and finally the peril of representation particularly under the local-level presidentialism focusing on the problems stemming from the dual representation system, the declining significance of partisanship, and the prevalence of independent candidates in the local electoral arena. Basic descriptions on Japanese electoral systems below largely draw on the most recent official information at the time of writing, which is published by of the Ministry of Internal Affairs and Commutations and available on the website http://www.soumu.go.jp/senkyo/senkyo_s/naruhodo/naruhodo03.html (accessed on August 6, 2017).

## Japanese Electoral Systems: National Elections

After the 1994 electoral reform, elections for the national legislators are elected by the following systems. Japan has adopted a bicameralism which is composed of the House of Representatives and the House of Councilors. As mentioned above, the House of Representatives is elected every 4 years, except for the case of being dissolved as a result of the passage of vote of no-confidence against the cabinet. Among 475 seats, 295 were elected by a SMD plurality system, whereas 180 seats are elected by PR as of September 2017. On May 2016, however, an electoral reform was passed to change the number of those seats. For the next general elections, the total number of seats will be reduced to 265 (minus 6 for SMD, minus 4 for PR). Voters cast one ballot for their chosen candidate running for the single-member district, and cast another ballot for their favorite party running for the 11 PR regional blocks. The allocation of districts is reconsidered every 10 years according to the population census.

On the other hand, the term for the House of Councilors is 6 years, and the half of the members are elected every 3 years. The elections for the House of Councilors are conducted by a combination of SNTV and PR. Among 242 seats, 146 seats are elected by SNTV, whereas 96 are elected by PR. For the SNTV race, each prefecture consists of one district, except for small prefectures. More specifically, two pairs of prefectures – Tottori and Shimane, and Tokushima and Kochi – compose one district respectively. In fact, due to population decline, a district magnitude is one in small prefectures. In this sense, the House of Councilors elections are a mix of SNTV in densely populated urban prefectures and SMD in non-urban ones.

For the PR competition, there is only one nationwide PR district. Voters cast one ballot for

their favorite candidate competing in the SNTV district, and cast another vote for their chosen party or candidate for the national PR race. In contrast to the elections for the House of Representatives, which use a closed-list PR, the PR to elect the House of Councilors uses an open-list, in which candidates from the same parties must compete with each other in order to maximize the number of votes to win the seat. In short, the number of seats for each party are determined by the total votes cast for the parties and candidates, and who win the seats among the parties are decided by his or her own personal vote share.

For both elections, voters who are unable to cast a ballot on the election day at the designated polling station are entitled to vote by absentee voting, early voting, postal voting, overseas voting, and on-the-sea voting.

## Japanese Electoral Systems: Local Elections

Japan is a unitary state comprising the national (or central) and local governments. Those local governments have two tiers: 47 prefectures and cities/towns/villages/a special district (only Tokyo). For each tier of local governments, elections for the chief executives and local legislatures are conducted following different electoral rules. On the one hand, the chief executives (prefectural governors and mayors) are elected every 4 years. Those elections are scheduled at the completion of the term of office, a dismissal as a result of residents' direct request for recall of the chief executives, the end of the term of office following the passage of a vote of no-confidence against the chief executives, death, the loss of eligibility for election, etc. On the other hand, elections for local legislatures are scheduled every 4 years. The elections are held for other special occasions: local legislators lose their status when local legislatures are dissolved.

According to the abovementioned official source of information by the Ministry of Internal Affairs and Communications, the nationwide local elections (*toitsu chiho senkyo*), in which local elections for the chief executives and legislatures are concurrent, have been scheduled since 1947. This was aimed at making voters more aware of local elections and improving efficiency in electoral management. However, there have been many cases in which the nationwide local elections were not conducted. This is primarily because municipal mergers restructured and created new local governments, which was followed by new legislative elections. Repeated municipal mergers made it more and more difficult for the electoral calendars of the chief executives and local legislatures concurrent.

For local elections, voters are not allowed to cast an overseas ballot and on-the-sea ballot. Only postal voting, absentee voting, and early voting can be an option for voters who are unable to cast a ballot on local election days at a designated polling site.

## Electoral Participation in National and Local Elections

Two trends are observed in terms of electoral participation in Japan. First, turnouts in national elections are generally higher than those of local elections. Comparison of turnouts in the most recent elections corroborates this general trend as follows (Ministry of Internal Affairs and Communications 2017: 4–5, 23). The voter turnout in the national elections was 52.66% for the House of Representatives election in 2016, 54.70% for the House of Councilors election in 2016. On the other hand, in the nationwide local elections in 2015, the voter turnout was 47.14% for the elections of prefectural governors, 45.06% for the elections of prefectural legislatures, 50.02% for the elections of mayors, and 47.33% for city councils' elections. It should be mentioned that this comparison is based on the average levels of turnouts for national and local elections. It is also emphasized that voter turnouts are generally higher in urban areas than those in rural areas.

Second, historically, the voter turnouts steadily declined for both national and local elections (ibid.). For the House of Representatives elections, the highest turnout was 76.99% in 1958, whereas the lowest was 52.66% in the last election in 2014. As for the House of Councilors elections, the

highest record was 74.54% in 1980, and the lowest was 44.52% in 1995. Turning to the local elections, the voter turnout reached a peak at the nationwide local elections in 1951. The turnouts were 82.58%, in the elections of chief executives of prefectures, 82.99% in the elections of prefectural legislatures, 91.02% in the mayoral elections, and 90.14% in the elections of city councils (ibid.).

Additionally, the following trends deserve special attention regarding electoral participation in special voting procedures. First, the percentage of voters who used early voting relative to the total eligible voters increased in the recent elections of the Houses of Representatives (SMD) and Councilors (SNTV). For the former, the percentage was 20.44% in 2012 but increased to 24.98% in the election of 2014. As for the latter, the percentage was 21.07% in 2010 and increased to 24.57% in the 2013 election (ibid.: 16). Second, in contrast to early voting, the percentage of voters who did absentee voting decreased in both elections. Third, postal voting gradually increased with temporal decline in the elections for both Houses (SMD for the House of Representatives, SNTV for the House of Councilors.). The most recent figure shows that the percentage of voters who used postal voting relative to the certificate holders was 67.41% for the House of Representatives election in 2014 and 70.60% for the House of Councilors election in 2016 (ibid.: 17). Finally, the voter turnout for overseas voting has been decreasing for the elections for both houses. More specifically, while the number of eligible voters and voters who actually cast overseas ballots have been increased, the latter has not increased in the same proportion to the former (ibid.).

## Problems of Representation in Local Elections

The unique combination of electoral systems both in national and local elections creates equally unique combination of systems of democratic representation: the national-level parliamentarism and the local-level presidentialism. Particularly, scholarly attention has been paid to the peril of democratic representation at the local electoral arena: the declining significance of partisanship and the presence of independent chief executives.

There has been a non-negligible number of local chief executives who are supported by competing political parties (*ainori*) and local legislators who are not willing to ally with any political parties represented at the national legislature (Hijino 2013; Sunahara 2011). Under the local-level presidentialism, the chief executives and legislature are elected by different elections, which means that the executives and legislators have different mandates from constituencies, and accordingly shape different policy preferences (Machidori and Soga 2007). For instance, there are cases in which the chief executives are elected with support from political parties competing at the national legislature or independently elected without support of any political parties. In these cases, it is more likely that those elected executives do not have a support base at the local legislature (Sunahara 2011: 32–38). As a consequence, rather than partisan competition, competition between the executive and legislature has become more salient at the local political arena (ibid.: 10). Thus, the local-level presidentialism creates different dynamics of political competition between the national and local levels in Japan.

From the standpoint of voters, the declining significance of parties prevents their interests from being properly presented at the local political arena. Voters can obtain information necessary for their vote choice through party labels (Aldrich 1995). Thus, voters have to pay higher costs in order to collect information about independent candidates at the local elections (Hijino 2013: 65). Furthermore, if a candidate for the chief executive is supported by competing political parties, the mandate of the candidate is not clear for voters.

| Electricity market | A mechanism through which electric energy is bought and sold |
| Market applications | Key software products used to compute market schedules and prices |

### Introduction

Reform of the power energy sector in Russia in the beginning of the 2000s led to development of a competitive electricity market and emergence of a number of independent generation and distribution companies. An overview of the market model and overall reform process is given in Davidson et al. (2004) and Letova, Yao, Davidson, and Afanasyeva (2018).

Most part of the energy system of Russia is interconnected and operates at a single frequency. The system is highly constrained and is characteristic for significant power transfers over high-voltage backbone grid. Simplified linearized models widely used in many energy markets might lead to critical scheduling errors and non-transparent deviations. A new short-term scheduling market-based technology that uses explicitly nonlinear power flow equations in accordance with alternating current model (AC model) was developed. The AC model yields the required accuracy in modeling losses and power flows to correctly account for the constraints set up by the system operator. As a result market-based schedules and pricing signals stand closer to real dispatch, and their economic value for the market participants is greater.

Since 2006–2007 the technology is exploited by the commercial market operator (Administrator of the Trading System – ATS) that runs the day-ahead market and the system operator (SO) that runs the balancing market. The aim of the latter is to reflect the most recent system conditions and to trade deviations from the day-ahead market. Balancing market schedule is computed every 1 h ahead of real time, and the resulting generation station schedules have a status of dispatch instructions.

The network model used in the market applications has around 9000 buses and 15,000 lines. The time horizon is broke down into hourly intervals for which intertemporal constraints are present: ramp rate constraints and energy volume constraints (especially for hydro-generators). Hence the resulting optimization problem is a large-scale nonlinear and nonconvex program. Due to the size and nonlinearity, the issues of timing and convergence reliability emerge that make developing solution algorithm a challenging problem.

Solution methods for the optimal power flow problem have been developed since the 1960s; see

a comprehensive survey by Frank, Steponavice, and Rebennack (2012). Among those are methods employing sequential linear programming (SLP), sequential quadratic programming (SQP), and more recent techniques based on interior point methods and semidefinite programming. However direct application of those methods failed to fit into timing and reliability requirements for the market applications on the Russian energy market.

The original contribution described in this entry is development of a numerical algorithm based on parallel processing and heavily relying on the structural properties of the model considered that allows an order of magnitude dimension reduction of the resulting optimization problem so that application of a standard optimization solver at each iteration becomes efficient. The algorithm is constructed within the SQP framework. SQP methods proved to be efficient in application to general nonlinear problems (Gould and Toint 2000) and optimal power flow as well (Burchett et al. 1982; Contaxis et al. 1986). In particular, successful application of SNOPT (Gill et al. 2005) to power flow optimization is reported in Castillo and O'Neill (2013).

The algorithm proposed is not only efficient in numerical data processing at each iteration, but it also demonstrates a high convergence rate. The number of iterations to reach the stopping criterion is normally within 10–20. More than 10-year experience of exploitation of the method in both day-ahead and balancing energy markets in Russia proves that the method became an adequate and reliable market technology.

In this entry the focus is on the model setup for the balancing market for which the key difference with the day-ahead is that the load forecast is provided by the system operator while at the day-ahead consumer bids are used.

This entry-chapter is organized as follows: section "Model Setup and Problem Formulation" details the problem setup used in the market; section "The Algorithm" provides description of the algorithm. Final remarks and open problems are summarized in Conclusions.

## Model Setup and Problem Formulation

A detailed description of the optimal power flow model and pricing mechanism can be found in Schweppe, Caramanis, Tabors, and Bohn (1984). In this section a formulation of this problem, constraint types, and control variables used in the Russian energy market are specified. The model includes both intertemporal and hourly constraints. The latter are referred to by the index $\tau = 1, \ldots, T$, where T is the number of hourly intervals in the session. Also a subset of variables relating to hour $\tau$ is denoted by the corresponding index. The following constraint types are present in the model:

### Power Flow Constraints

Alternating current power flow model includes both active and reactive power balance equations at each bus of the network model. However, only active power is subject to trading in the Russian energy market. The values of controls such as transformer taps and generator voltage set points and other devices that essentially impact the reactive power balance are accepted as inputs to the problem and not varied. While reactive power balance equations are explicitly present in the problem formulation, optimization of reactive power is not performed in order to avoid potentially negative effects of using active power controls to enforce voltage and reactive power constraints and vice versa (Stott and Alsac 2012).

At the same time, regulation of reactive power by generation sources is modeled through switching "generator" and "load" bus types depending on the maximum and minimum reactive power capacity of a source and required reactive power consumption/generation at the corresponding bus. The maximum and minimum reactive power capacity is assumed constant not depending on the active power output of a generator. In other words accounting for reactive power is similar to the load flow model.

The active power controls that are subject to optimization at the balancing market are the volume bids submitted by the generators. The load forecast is provided by the system operator. Thus, the power flow equations connect the state

variables $y_\tau$ (bus voltage magnitudes and angles), the active power volume bids $x_\tau$, and the fixed net bus injections $d_\tau$ representing the demand:

$$[\lambda_\tau] F_\tau(y_\tau) + Bx_\tau = d_\tau, \quad (1)$$

(here the quantity in square brackets denotes the corresponding Lagrange multipliers), $B$ is the buses – bids incidence matrix. The number of equations in (1) is twice the number of buses (excluding swing bus) reflecting active and reactive nodal power balance. A separate notation for the swing bus balance equation is used:

$$[\lambda_0] F_{0\tau}(y_\tau) = 0. \quad (2)$$

This is an additional equation to compensate for imbalance of the nodal power injections in a load flow model which can be written as follows:

$$e^T(d_\tau - x_\tau) + L(y_\tau) = 0$$

where $L(y_\tau)$ is the loss function (sum of losses over lines).

Since there is no optimization for reactive power controls, the reactive power swing bus equation is slack and (2) represents only active power balance.

### Power Transfer Constraints

Power transfer constraints represent a set of most likely contingency scenarios under given operating conditions modeled and precomputed by the system operator. For every such constraint, SO defines a power transfer limit that guarantees system security after any single contingency, and these are the inputs to the model:

$$[\sigma_\tau]\ G_\tau(y_\tau) \le \overline{f}_\tau. \quad (3)$$

### Intertemporal Constraints

These include ramp rate and fuel generator constraints. The latter model the daily water supply of hydro-generators to be optimally allocated among hourly intervals. Both ramp rate and fuel constraints are linear and link only volume variables. We denote these constraints by a single inequality (including upper and lower bounds):

$$ITx \le b_{IT} \quad (4)$$

where $x = (x_1, \ldots, x_T)^T$.

### Bounds for Variables

For generation volumes $x_\tau$, there are upper and lower bounds submitted by the generators in their bids

$$lb_\tau \le x_\tau \le ub_\tau. \quad (5)$$

We don't apply bounds on voltage magnitudes since as said above the controls affecting reactive power and voltage magnitudes are not optimized.

### Problem Formulation

The objective function used at the RF balancing market is minimum of the cost of energy produced by the generators according to their price bids. Thus, the problem formulation is

$$\sum_\tau c_\tau^T x_\tau \to \min \quad (6)$$

subject to constraints (1) and (5). This is a nonlinear, nonconvex, and large-scale optimization problem. The size of the problem is of order 5e+5 variables and constraints. Modeling "generator" and "load" bus types switching brings a discrete discontinuous nature to the problem.

## The Algorithm

Here a variant of SQP algorithm used in the Russian energy market is presented.

For a given pair $(y, x)$ and the corresponding vector of Lagrange multipliers $(\lambda, \sigma)$, generic form SQP subproblem as applied to (5) appears as follows:

$$\sum_\tau \left(c_\tau^T \Delta x_\tau + 1/2 \Delta y_\tau^T H_\tau(\lambda_\tau,\ \sigma_\tau,\ y_\tau) \Delta y_\tau\right) \to \min \quad (7)$$

subject to

$$DF_\tau(y_\tau)\Delta y_\tau + B\Delta x_\tau = r_\tau^F \quad (8)$$

$$DF_{0\tau}(y_\tau)\Delta y_\tau = r_\tau^{0\tau} \quad (9)$$

$$DG_\tau(y_\tau)\Delta y_\tau \le r_\tau^G \quad (10)$$

$$IT\Delta x \le r^{IT} \quad (11)$$

$$lb_\tau \le x_\tau + \Delta x_\tau \le ub_\tau \quad (12)$$

where (8), (9) and (10) are linearization of constraints (1), (2) and (3) around $y$ and $H_\tau(\lambda_\tau, \sigma_\tau, y_\tau) = \sum_i \left(\lambda_\tau^i \nabla_{yy}^2 F_{\tau i}(y_\tau)\right) + \sum_j \left(\sigma_\tau^j \nabla_{yy}^2 G_{\tau j}(y_\tau)\right)$ is the element of the Hessian of the Lagrange function of (6) corresponding to hour $\tau$. Only Hessians of constraints (1), (2) and (3) enter the formula for $H_\tau$ as the rest of the constraints are linear (let the first sum contain Hessian terms of both equations (1) and (2)).

## Problem Reduction

The structure of the model lends a natural partition of variables as state variables $y$ and controls $x$. According to the implicit function theorem, as long as equations (1) are solvable with respect to the state variables $y$, the Jacobian $DF_\tau(y_\tau)$ is nonsingular, and $y$ could be seen as implicit functions of controls $x$, and the state increments could be expressed via the control increments:

$$\Delta y_\tau = DF_\tau^{-1}(y_\tau) r_\tau^F - DF_\tau^{-1}(y_\tau) B_\tau \Delta x_\tau. \quad (13)$$

Since the controls (degrees of freedom) are the generator bids by the model sense, their number is much smaller than the number of buses. Moreover for the vast majority of large-scale electric grids, their connectivity structure is sparse, and hence sparse is the structure of the Jacobian of the power flow equations $DF_\tau(y_\tau)$. Therefore sparse matrix factorization could be used to efficiently compute the reduced gradients of swing bus equations $F_{0\tau}$ and power transfer constraints $G_\tau$ with respect to the nodal power injections. Although the reduced gradients do not keep sparse structure, the size of the corresponding matrices is generally small. Dimension of $F_{0\tau}$ is the number of swing buses (islands) in the system. Most part of the system operates as a single whole; however, temporarily a part may operate separately due to grid maintenance. In practice the number of islands does not exceed three.

Power transfer constraints (3) are managed using an extended active set strategy: inequality (10) contains linearized constraints (3) binding at the current iterate $y_\tau$ or at any of the previous iterates. At a cost of slightly expanding the active set, the oscillations in the course of the method are avoided, and the convergence is stabilized. In the authors experience, the number of the elements in the extended active set rarely exceeds 20 per hourly interval. Hence computation of the reduced gradients for (2) and (3) is cheap.

Additional computational savings could be achieved by employing the fact that the structure of the Jacobian does not change from iteration to iteration: the symbolic analysis of the matrix structure required for the sparse LU can be performed only once. However, this holds only until there is "generator"-"load" bus type switching.

Computation of the reduced Hessian is the most time-consuming. The reduced Hessian has the form

$$\widetilde{H}_\tau(\lambda_\tau, \sigma_\tau, y_\tau) = B_\tau^T \left(DF_\tau^{-1}\right)^T H_\tau DF_\tau^{-1} B_\tau.$$

The L, U factors of $DF_\tau$ are not sparse and so is $\widetilde{H}_\tau$. While dimension of $\widetilde{H}_\tau$ is much smaller than that of $H_\tau$, the algorithm takes into account in addition that the columns of $B_\tau$ are identical for generators located at the same bus. For computing the reduced Hessian, it is sufficient to keep only one column per bus which reduces the time for computing $\widetilde{H}_\tau$ up to three times.

In order that the solution to the SQP subproblem be well-defined, $\widetilde{H}_\tau$ has to be positive semidefinite. In general this does not hold. In the algorithm a positive semidefinite approximation to the reduced Hessian denoted by $\widetilde{H}_\tau^+$ is used.

In reduced form the SQP subproblem (7) will appear as follows:

$$\sum_\tau \left(\widetilde{c}_\tau^T \Delta x_\tau + 1/2 \Delta x_\tau^T \widetilde{H}_\tau^+ \Delta x_\tau\right) \to \min \quad (14)$$

subject to constraints

$$L_{0\tau}B\Delta x_\tau = r_\tau^L \tag{15}$$

$$S_\tau B\Delta x_\tau \le r_\tau^S \tag{16}$$

and (11) and (12) that remain unchanged. Here $L_{0\tau}$ and $S_\tau$ are the reduced gradients of $F_{0\tau}$ and $G_\tau$, respectively:

$$L_{0\tau} = -DF_{0\tau}DF_\tau^{-1}, S_\tau = -DG_\tau DF_\tau^{-1}$$

$\widetilde{c}_\tau$ is the combination of $c_\tau$ and terms that appear after substitution (13):

$$\widetilde{c}_\tau = c_\tau - \left(r_\tau^F\right)^T \left(DF_\tau^{-1}\right)^T H_\tau DF_\tau^{-1}. \tag{17}$$

The reduced problem (14) has the dimensions of at least an order of magnitude less than the original problem and can be efficiently solved by standard QP solvers.

### Use of Parallel Processing

Most of the computational effort of the algorithm at each iteration is to build the reduced problem (14). However the computations required to evaluate the constraints and the reduced gradients and the Hessian matrix are independent for each time interval. This allows constructing constraint matrices in (15) and (16) and the Hessian matrix $\widetilde{H}_\tau$ in parallel for every time interval. Upon completion of each parallel thread, the block-diagonal Hessian and constraint matrices are assembled, and intertemporal constraints (11) and (12) are added, and the resulting reduced problem (14) is passed to the solver. Parallelization together with problem size reduction provides substantial time savings that make the problem solvable in a time frame required for time-critical market applications.

### Stopping criterion and market equilibrium prices.

The stopping criterion is defined as follows:

(i) The current iterate is feasible for (6) to a given feasibility tolerance.

(ii) The norm of $\widetilde{H}_\tau^+ \Delta x_\tau$ is within the optimality tolerance.

If the method reaches a point at which (i) and (ii) are satisfied, then Lagrange first-order optimality conditions hold for problem (6), and based on Lagrange multipliers, one can define locational marginal prices that are the market equilibrium prices.

Indeed, the first-order Lagrange optimality conditions for (6) imply

$$\lambda_\tau^T DF_\tau(y_\tau) + \lambda_{0\tau}^T DF_{0\tau}(y_\tau) + \sigma_\tau^T DG_\tau(y_\tau) = 0 \tag{18}$$

$$c_\tau^T + \lambda_\tau^T B + \pi_\tau^T = 0$$

where $\pi_\tau$ denotes the aggregate dual term related to constraints (4) and (5) and has a sense of "shadow price on capacity" using the terminology of Schweppe et al. (1984). By multiplying (19) by $DF_\tau^{-1}$, one derives representation for the locational marginal prices (LMPs) $\lambda_\tau$ that are the market equilibrium prices (Schweppe et al. (1984)):

The reduced subproblem (14) is convex, and the solution is characterized by the Karush-Kuhn-Tucker conditions from which one has

$$\widetilde{c}_\tau^T + \Delta x_\tau^T \widetilde{H}_\tau^+ + \lambda_{0\tau}^T L_{0\tau} B + \sigma_\tau^T S_{0\tau}^T B + \pi_\tau^T = 0 \tag{19}$$

Since from (i) the state is feasible up to a given feasibility tolerance, the residual $r_\tau^F$ of (8) is small and then from (17) $\widetilde{c}_\tau$ is close to $c_\tau$. From (ii) the second term in (19) is less than optimality tolerance, and hence (19) is close to

$$c_\tau^T + \pi_\tau^T = \lambda_{0\tau}^T L_{0\tau} B + \sigma_\tau^T S_{0\tau}^T B. \tag{20}$$

The expression on the right-hand side of (20) is equilibrium prices at generation unit buses. Hence the stopping criteria (i) and (ii) yield the equilibrium condition for the computed schedule of every unit at locational marginal price. As energy pricing in the Russian energy market is based on LMPs, this makes the resulting schedule and prices clear, transparent, and justifiable for the market participants.

Conditions (19) have dimension of national currency units per MWh. Hence the choice of

the optimality tolerance could be linked to the minimum fraction of the currency unit (e.g., one hundredth) up to which the price is stated for accounting purposes.

## Conclusions

For the period of operation, the model proved to be an adequate short-term scheduling market technology. The locational marginal pricing mechanism provides economic signals to participants that are concordant with the dispatch. The accuracy of the model could be illustrated by the amount of dispatch instructions issued beyond the computed schedule. According to the report on operation of the United Power System in 2016 (2017), this is within 1% of the scheduled amounts.

The technology has also proved to be reliable. However, since the scheduling is time critical, a possibility for the dispatch personnel to analyze the resulting electrical regimes (especially in the case of problems or convergence breakdowns) is limited. Further research and work are aimed at developing algorithms for identification of weak locations in the energy system that may be a cause of divergence and providing the corresponding information to operation personnel.

# Electronic Voting Systems and Elections in Africa

Isaac Kofi Mensah
School of Economics and Management, Jiangxi University of Science and Technology, Ganzhou, People's Republic of China

## Synonyms

Democracy; Election management; Elections; Electronic voting; ICT; Manual voting

## Definitions

| | |
|---|---|
| Elections | The legitimate process of deciding who represents the people. |
| Manual voting | The absence of technology in the voting process. |
| Electronic voting system | The use of information technology to manage the electoral process particularly the voting process. |
| Africa | A continent with 54 countries. |
| ICT | Information and communication technology. |

## Introduction

Elections are means by which political parties are mandated by the electorate and citizens to manage the affairs of State on behalf of the citizenry. Elections permit the people to select their preventative and expression of their choices as to how they want to be governed (Kohno et al. 2004). However, elections and election management in Africa are peculiar because of the various challenges associated with elections across countries on the continent. One of the major challenges associated with elections in Africa is the manual election management process which includes the manual voting system. That is the lack of the use of information and communication technology to improve the election management process and especially during the voting period is a major setback in achieving credible elections that is acceptable by all. As indicated by International Peace Institute (Institute 2011), free and fair elections are a vital component of creating a healthy democratic society and that robust civil society, independent media, a sound public administration system, and independent media contribute to managing the major tensions and grievances that arise after elections are conducted.

The manual election management in Africa has often time degenerated into electoral violence due to the lack of trust and confidence in the outcomes of election results declaring winners and losing candidates. Some measures have been proposed to deal with electoral violence (Institute 2011):

(a) A national early-warning mechanism should be integrated into election cycles so that chances to handle electoral violence are available before it gets out of control.
(b) Well-trained and competent security forces that respect the public's civil and political rights and do not discriminate based on ethnicity, race, religion, or gender thereby prevent tension from deteriorating into violence.
(c) A credible and timely complaint process will empower citizens who feel that their rights have been violated to report their concerns and actions taken accordingly to address it.

While these recommendations can contribute to reducing election-related violence, however, the introduction of information and communication technologies in the election management processes could be instrumental in preventing this electoral violence. The adoption of appropriate information and communication technology in the election management processes has the potential to eliminate the phenomena of manual voting processes. The use of information technology in the voting process is termed as electronic voting (e-voting). Electronic voting is considered a tool for making the electoral process more efficient and for increasing trust in the electoral management body (Wolf et al. 2011). It can increase the security of the ballot, speed up the processing of results, and ensure vote casting is easier (Wolf et al. 2011). The shift to electronic voting enhances voter convenience and increases voter confidence and voter turnout (Bungale and Sridhar 2003).

This entry attempts to examine the election management and voting process in Africa vis-à-vis the adoption of an electronic voting system. E-voting technology is seen as a promising instrument to overcome the numerous challenges that most countries in Africa are faced with when the annual electioneering processes are undertaken. Hence the familiarization of both government agencies and election management bodies with the technological implications of the adoption and implementation of e-voting systems is important not only to the voters but also in ensuring sustainable peace and development. This is because the absence of credible elections can lead to political unrest and thus affecting the political stability, peace, and tranquility within countries.

The entry is organized as follows: elections in Africa, electronic voting system, challenges of e-voting in Africa, discussion, and conclusion.

## Elections in Africa

Countries that have conducted their elections in 2019 are shown in Table 1. Some of these elections were postponed due to varying factors (Fig. 1).

**Electronic Voting Systems and Elections in Africa, Table 1** Overview of Africa's 2019 Elections (Joseph 2019)

| Country | Type of Election | Date |
|---|---|---|
| Nigeria | General | February 23 |
| Senegal | Presidential | February 24 |
| Guinea-Bissau | Legislative | March 10 |
| Burkina-Faso | Referendum | March 24 (postponed) |
| Comoros | Presidential | March 24 |
| Algeria | Presidential | April 18 (postponed) |
| Benin | Legislative | April 28 |
| South Africa | General | May 8 |
| Malawi | General | May 21 |
| Madagascar | Legislative | May 27 |
| Chad | Legislative and Local | May (postponed) |
| Mali | Legislative | June (postponed) |
| Mauritania | Presidential | June 22 |
| Tunisia | Presidential | September 15 |
| Tunisia | Legislative | October 6 |
| Mozambique | General | October 15 |
| Botswana | General | October 31 |
| Cameroon | Legislative | October |
| Namibia | General | November 27 |
| Guinea-Bissau | Presidential | November 24 |

## Electronic Voting System

An electronic voting system is the use of technology to improve the voting and records of votes account. An electronic voting system or machine is described as a basic electronic machine that is used to store the votes instead of ballot papers and boxes which is often used in the traditional voting system (Hapsara et al. 2016). The goal of electronic voting technology is to provide plain, simple, and secret voting processes, speed up the counting of ballots, reduce the cost of paying staff to count votes manually, and provide improved accessibility for physically challenged voters (Jones 2003). Electronic voting is the use of a computer-based system in the electoral processes such as registration, vote cast, counting, and result-notification (Hapsara et al. 2016). Also, electronic voting systems are meant to reduce errors and to speed up the counting process (Hapsara et al. 2016). Some of the advantages of the electronic voting system over the traditional paper ballot/box system are:

(i) It removes the possibility of invalid and uncertain votes which, in many cases, are the root causes of dispute and election appeal.
(ii) It makes the procedure of counting the votes much faster than the traditional system.
(iii) It decreases to a great expanse the quantity of paper used so saving a large number of trees making the process eco-friendly.
(iv) It minimized the cost of printing to almost zero.

An electronic voting system can be categorized into two types such as poll-site where is a fixed computer for voters to vote and remotely at places or homes for voters to access through their computers or phones (Mensah 2016). The on-site poll system is described as direct recording electronic devices (DREDs) and it is usually managed and supervised by a representative of the election management body (EMB) with an electronic voting machine at the polling station. But in terms of remote voting, the e-voting process is not physically supervised and voting can take place from a computer device via the Internet, mobile phones, etc. (Mensah 2016). An electronic voting system has six main components such as voter registration, authentication, voting, voter management, vote counting, and auditing (Jegede et al. 2012).

**Electronic Voting Systems and Elections in Africa, Fig. 1** Overview of elections in Africa (Joseph 2019)

## Challenges of E-voting in Africa

The adoption of e-voting technologies to deepen the democratic practices of countries particularly in Africa has numerous advantages and benefits such as reduced logical arrangements, accessibility, an increase in turnout, and minimization of cost. First, the reduced challenges in the logistical arrangements as a result of the e-voting system can ensure that the ballots logistic printing and distribution are done with an easy and efficient manager. The e-voting system encourages the proper configuration and preparation arrangements for the technology and right storage and security for the election periods (Goldsmith and Ruthrauff 2011). Another important benefit of the e-voting system is the remote electronic voting and thus encourages increased accessibility to the electoral systems. Hence people who are at a disadvantage due to their location or disabilities can take part in the election process.

Furthermore, the e-voting system can encourage high turn-out during Election Day in terms of voting and speeding counting processes. This can influence the level of trust of citizens toward the e-voting system. Also, the e-voting system can eliminate or reduce the cost in terms of the expenditure for ballot printing, distribution, and storage (Goldsmith and Ruthrauff 2011).

Despite these advantages and benefits, e-voting is confronted with many challenges such as technological challenges, lack of transparency, Audit results, voter education, and security. It has been indicated that the greatest obstacle for the implementation of the e-voting system is not the issue of technology but instead the concept of change management (Gupta 2011). The matter of change management is critical not only in terms of cultural changes but especially in terms of changing operations and processes that come with the e-voting technology system (Achieng and Ruhode 2013). The e-voting

challenges identified in Nigeria (Ahmad et al. 2015) which applies to the majority of African countries are:

- Absence of a legal framework
- Ineffective means of national identification
- Inadequate database of voters
- Inadequate requisite ICT infrastructure including electric power supply
- Lack of participatory policy process
- Inadequate trial of the technology in non-public election
- Apprehension by electorates over the motives behind proposed e-voting systems
- Loss of trust and confidence in the electoral officials.
- Digital divides
- Low level of computer literacy and technology phobia among the electorates
- Inadequate technical and managerial capacity to handle sophisticated technology
- Security and reliability of the technology
- Lack of adequate information on the procedure involved in the e-voting system
- Capital intensive nature of e-voting projects as against cost-effectiveness/value for money

### Technological Challenges

The major challenge of many of the new technology is the issue of technical challenges such as the lack of poor infrastructure which hampers the smooth implementation of these technologies, especially in the context of e-voting due to the absence of adequate technological infrastructure which presents challenges of good connectivity in remote places. The technology challenge for the implementation of e-voting is seriously challenged due to the lack of financial capacity of most countries in Africa to spearhead the successful deployment of these technologies. The result of a study has revealed that for instance in Nigeria, a country in West Africa, poor ICT infrastructure posed a serious challenge for the transition to e-voting in that country (Ahmad et al. 2015). Furthermore, there are pre-adoption challenges of e-voting systems such as inadequate funding, lack of IT specialists, erratic electricity supply, growing level of cybercrime, and gender variance to accessing ICT (Onyekwelu 2010).

### Lack of Transparency

Another major challenge in the implementation of -e-voting is the lack of trust and transparency of citizens toward its deployment by the government and the election management body. Trust and transparency have been indicated to be the basic fundamental ingredient for building and maintaining stakeholders' trust in the electioneering management process (Goldsmith and Ruthrauff 2011). The voters have to have an unqualified trust toward the use of e-voting systems for voting casting, ballot counting, and declaration of results. The system must demonstrate beyond any reasonable doubt that the results declared by the e-voting system will truly represent their decisions and choices made at the polls.

### Audit of Results

Auditing the result outcomes during and after the election process is a great challenge and critical to the success of e-voting systems. Acceptance of e-voting system must provide a better if not better verification or auditing of the results as pertains to the manual voting system in terms of challenges results that can be recounted for greater accuracy of results (Achieng and Ruhode 2013). It has been elaborated that the potential of an e-voting system to demonstrate higher levels of audit and check is instrumental in building trust and thus unconditioned acceptance of results of an election (Goldsmith and Ruthrauff 2011).

### Voter Education

Even under the manual system of voting, the issue of voter education among the citizens was always a challenge and so a new technology such as e-voting system adoption must be herald by extensive voter education. Importantly, adequate preparation is required to condition the minds of the voters to accept the shift from an e-voting system (Achieng and Ruhode 2013; Goldsmith and Ruthrauff 2011). In Africa where the level of literacy is very high, a lot of voter education is required to ensure greater awareness and acceptance of the use of e-voting systems among the people, particularly in the deprived and rural areas.

### Security

Security is of most importance to any new technology system such as an e-voting system. The nature of security challenges inherent in the

e-voting system is higher as compared to the paper balloting methods (Achieng and Ruhode 2013; Goldsmith and Ruthrauff 2011). The electronic transmission of results for tabulation for instance may present possible security challenges such as the hacking and declaring of false results. This, therefore, calls for stringent measures to ensure the protection and verification of result data during the voting and counting processes of e-voting (Goldsmith and Ruthrauff 2011).

## Discussion and Conclusion

Countries in Africa cannot be left out of the use of new information technology systems to deepen the democratic processes in their respective countries particularly when it comes to the expression of the voice of the people through the ballot box. The adoption of the right technology in elections in Africa will lead to the design of a well-functioning e-voting system that helps reduce the challenges associated with the manual system of voting. The adoption of e-voting systems will contribute drastically to reducing problems of manual voting such as the cost of physical ballot papers, distance to polling stations, long queues on election day, electoral delays, distribution of electoral materials, lack of confidence in the electoral process, etc. (Achieng and Ruhode 2013). Also, the manual system of voting is tedious, nonsecure, and time-consuming (Achieng and Ruhode 2013).

# Elite Panic, Japan

Tatsuya Nogami
Japan Fire and Crisis Management Association, Tokyo, Japan

## Synonyms

Disaster myth; Mass flight; Misconception about disaster behavior; Panic; Stampede

## Definitions

| | |
|---|---|
| Disaster myths: | Common misconceptions about disasters and disaster behavior |
| Panic: | Irrational emotional and/or behavioral responses triggered by sudden strong feelings of fear and/or anxiety |
| Elite panic: | Inappropriate disaster response by persons and/or organizations in positions of authority who panic about the possibility of panic among the general public |

## Introduction

People have several misconceptions about human behavior in a disaster. Such misconceptions have been known as *disaster myths* among disaster researchers. One of the commonest disaster myths is *panic* among the general public. Although empirical evidence has indicated repeatedly that panic is rare in emergency situations, many people still hold a firm belief that panic is likely to occur, particularly in a crowd of people, when a major disaster strikes (Nogami 2016).

## Human Behavior in the Wake of a Disaster

Despite empirical evidence that panic is rare in a disaster, it is not rare to find media reports on disasters using the term panic. Such media accounts, as well as popular culture including novels and movies, often portray disaster victims screaming and running away during a disaster. In fact, people occasionally scream and/or flee from danger, when a major disaster suddenly strikes (e.g., an earthquake). However, in many cases such behaviors are functional and reasonable in disaster situations from the disaster victim's perspective.

More important, flight behavior, which is strongly associated with the term panic, rarely results in a massive stampede killing others (Quarantelli 2001). Even when panic occurs, only a few persons locally engage in flight behavior for a short duration of time. Contrary to the panic myth, one of the major problems in emergency situations is to make people evacuate rather than mass flight. Also, the majority of people generally show prosociality and altruism immediately after a disaster occurs (e.g., rescuing other victims). In other words, the term panic, generally defined as irrational emotional and/or behavioral responses triggered by sudden strong feelings of fear and/or anxiety, is in many cases not an appropriate word to describe disaster victims' initial responses to a disaster.

Past disasters in Japan also indicates that the majority of people did not engage in mass flight or irrational collective behavior even immediately after a major disaster suddenly struck. For example, when a huge volcanic eruption occurred in Izu Oshima in 1986, more than 10,000 residents and tourists had to evacuate from the island within a day. Despite a short time frame for evacuation, the majority of the local residents were reported to have evacuated without major confusion. When the Great Hanshin-Awaji Earthquake struck in the early morning of January 17, 1995, numerous people suddenly got trapped in collapsed houses while sleeping. Rather than disaster response professionals, many of the trapped victims were actually rescued by other local residents, who had managed to get out of their collapsed houses on their own. These residents did not flee from the affected areas right after the initial earthquake but decided to stay in the affected neighborhoods performing life-saving activities in the face of aftershocks, fire, and the possibility of building collapse.

Even immediately after the Great East Japan Earthquake on 11 March 2011, most residents living along the coastline in the three most affected prefectures, Iwate, Miyagi, and Fukushima, engaged in rational and reasonable behaviors. Their initial responses to the disaster consisted of evacuating to safer places, returning home, and trying to find/pick up one's family members. There is no doubt that some individuals did engage in flight and/or irrational behavior in this particular disaster, as well as in other disasters. However, at least mass flight or any form of irrational collective behavior was not reported to have occurred even in Japan's largest earthquake.

The existence of the panic myth was confirmed at least by the 1950s. Since then, the myth has been found in several different cultures, including North America, Europe, and East Asia. The panic myth

has been found not only among lay people but also among emergency management personnel, policy makers, and media personnel. Because emergency management personnel and policy makers, as well as anybody in a position of authority, can exercise more powerful influence on society and organizational action than lay people, their fear of panic in a disaster could result in inappropriate disaster responses in emergency situations, which is called *elite panic* (Clarke and Chess 2008). If elites, those in positions of authority, panic about the possibility of panic among the public during a disaster, they could take inappropriate decisions and actions, possibly exposing the public to more realistic dangers than panic itself (e.g., withholding an evacuation warning in fear of potential mass flight among the general public). Therefore, the panic myth cannot be dismissed as a mere misconception about disaster behavior.

In fact, Japanese government officials caused elite panic during the 2011 Great East Japan Earthquake. After hydrogen explosions occurred at the Fukushima Daiichi Nuclear Power Plant on 12 March 2011, the central government decided not to disclose some of the critical information about the potential consequences of the explosions to the public (forecasts of how radiation would spread from the broken plant). More than a month after the explosions, the government officially announced the information and apologized to the public by stating that they had refrained from disclosing the information to the public in order to avoid panic in society. The government officials obviously held the belief that panic among the general public would potentially be more dangerous to society than radiation leaking from the broken plant would be to the public.

Even immediately after the explosions took place on 12 March 2011, no visible mass flight was reported to have occurred among the general public in Fukushima or in other parts of Japan, such as massive stampedes at public transportation facilities and traffic congestions on roadways rushing out of Fukushima or the country. Local residents living around the broken plant in Fukushima also did not engage in mass flight, but they were forced to leave their homes before the meltdown announcement due to their neighborhoods being designated as no-go areas. Even after the government officially announced that the meltdown had actually taken place at the Fukushima Daiichi Nuclear Power Plant, the majority of the Japanese did not become panicky performing irrational behavior in crowds. Only a minority of people living outside the no-go areas actually decided to voluntarily leave the eastern part of Japan for the western part to protect their families and themselves from radiation leaks. However, such evacuation behavior was not reported to have caused any serious problem in Japanese society.

Fortunately, the government's forecasts of radiation diffusion patterns were not accurate enough. Consequently, local residents who had been in the forecast areas were not as radiation-affected as initially predicted. However, if the forecasts had been sufficiently accurate, these locals could have received excessive amounts of radiation leaking from the broken plant. The post-disaster situation could have become much worse because of the inappropriate disaster response by the central government. The disaster response professionals, who are responsible for the safety of the general public in a disaster, could have victimized the public due to their misconception about disaster behavior.

Even during nondisaster periods, the panic myth held by emergency management professionals and policy makers can affect society and the general public. For instance, some country has official emergency guidance documents representing panic as an unreasonable emotional and behavioral reaction to which crowds of people are susceptible in an emergency situation. Furthermore, one Japanese municipal organization published an emergency booklet for its residents in order to make them aware of the predicted disaster in their region. The booklet has several paragraphs mentioning the possibility of panic in the disaster, implying that panic is something detrimental to their evacuation behavior. Depictions of panic in these kinds of publications can only reinforce the misconception that panic is likely to occur in a disaster.

In Japan, public servants, particularly those in charge of disaster risk reduction and/or crisis management, are responsible for ensuring the safety of local residents whenever a disaster takes place. They provide disaster information, evacuation

center, and emergency necessities for affected local residents in postdisaster situations. These professionals generally have disaster response training programs at work, and some of them have had direct experience in dealing with disasters. In fact, an emergency management personnel is generally more insightful into how people behave in a disaster than lay people. However, these professionals are still found susceptible, more or less, to the panic myth despite their extensive knowledge and experience.

Elite panic, as well as the panic myth, is not only unique to Japan or Japanese disaster response professionals. Nonetheless, since Japan is one of the most disaster-prone countries in the world, the probability that Japanese elites cause elite panic should be higher than in other less disaster-prone countries. Considering negative consequences that elite panic can possibly produce, every professional in charge of disaster risk reduction and/or crisis management needs to deepen their understanding of what panic in a disaster really is and how the misconception about panic could potentially affect their disaster response.

It is still unknown why people, including emergency management personnel and policy makers, tend to overestimate the possibility of panic in a disaster. However, according to previous research on disaster myths, the mass media and popular culture have been thought to be responsible for disseminating distorted images of disaster behavior. In fact, exaggeration and sensationalism in media reports on disaster behavior can easily be found, once a disaster strikes (e.g., "a large earthquake triggers panic in city center"). Popular culture, particularly movies, has also been infamous for exaggerating and distorting human behavior during disasters. Although influences of the mass media and popular culture on the creation of disaster myths are still inconclusive, it seems evident that the media and popular culture contribute, to a certain extent, to creating erroneous images of human disaster behavior including panic.

Another potential source of disaster myths may stem from the tendency of human perception. It has been well known in psychology that people tend to estimate the frequency or probability of an event based on how easily similar events can be brought to mind, which is called the availability heuristic. Because of this tendency, it is possible that panic, whatever the term may indicate, may come to people's mind more readily than other common disaster behavior, such as reluctance to evacuate and altruism, through a one-shot striking depiction of apparently panic-like behavior (e.g., running away from a building). Although more research is obviously required, this tendency, as well as other perceptional tendencies that humans have, is likely to play a role in creating the long-standing misconception about panic in a disaster.

## Conclusion

It is not that panic, whether mass flight or any form of irrational collective behavior, never occurs in a disaster situation. Nonetheless, there have been very few cases found in more than half a century of research on panic in a disaster in which panic actually took place making disaster situations worse (e.g., people lost their lives because of a stampede for an exit in a fire). On the one hand, from a crisis management perspective, emergency management personnel and policy makers can never ignore the possibility of panic in a disaster even if the phenomenon is very rare to occur. On the other hand, it is very risky decision-making if these professionals fail to handle probable emergency events in an appropriate way as a result of paying too much attention to very rare emergency events. This is what elite panic is all about.

# Emergency Governance, Bangladesh

Marzina Mst Begum and Nurul Md Momen
Department of Public Administration, University of Rajshahi, Rajshahi, Bangladesh

## Synonym

Bangladesh; Human rights; Power; States of emergency

## Definition

A state of emergency means the proclamation of the government made in response to an extraordinary condition which is considered as a threat to the life of the nation.

Emergency declaration allows the government to limit or suspend fully some civil liberties and fundamental rights and alert individuals to change their normal behavioral pattern.

## Introduction

Emergency governance has received a lot of scholarly attention in academia. The democratic countries in the world maintain a detailed provision with respect to the declaration of emergency to tide over an actual or imminent threat to the nation due to varieties of reasons, including war, external aggression, armed conflict, internal disturbance, natural disaster, and severe economic crisis (Bari 2014, p. 578). It is noteworthy that adopting the power to declare an emergency in a state, which is considered as a last measure to the government. Hence, declaration of a state of emergency is considered as a last resort to any government.

It is often heard about the proclamation of states of emergency across the world. Immediately after the proclamation, the government generally limits or suspends all or some of the fundamental human rights for the enforcement in the judicial system. Adopting the emergency measures of suspension is justified on the basis that civil liberties and fundamental rights of the citizens must not create any obstacles to the government for taking swift and extraordinary measures necessary for resolving emergency situation which helps to maintain the integrity of the state (Bari 2014, p. 579). Given the circumstances, it is argued that if the state sustains, fundamental rights of the citizens will also be protected. Alternatively, in negative sense, if the state does not sustain, individual's rights must not be protected either.

Constitutionally, right to freedom of association, expression, and peaceful assembly are enjoyed in an unrestrained manner, but at the time of an emergency (Fitzpatrick 1994, p. 37) these rights are curtailed on the ground that they might confront with the efforts of the government to overcome the challenges posed to the nation for the purpose of restoring peace and security. It is important to note that emergency situations are, in general, characterized not only by limiting or suspending the abovementioned civil liberties and fundamental rights (Meron 1986, p. 86), but also expand the special power of the executive.

However, the proclamation of emergency and the derogation of human rights and its measures are found in the Article 4 of the International Covenant on Civil and Political Rights (ICCPR), Article 15 of the European Convention on Human Rights (ECHR), and Article 27 of the American Convention on Human Rights (ACHR). Member states who have ratified to these instruments may take some measures derogating from their obligations under the instruments at the time of states of emergency (Tessema 2005, p. 7). ICCPR in 1966 was signed by 167 member states, which is still considered as the most important universal legal instrument on civil liberties and human rights (Meron no date, p. 83). ICCPR attempts to make a balance between protection of national interests, on the one side, and safeguard of individual rights, on the other side, during the state of emergency. ICCPR empowers member states as parties to derogate from their obligation to enforce the fundamental rights of the citizens mentioned it in the ICCPR during an emergency (see International Covenant on Civil and Political Rights (ICCPR). It is worthy to note that in the Article 40 of

the ICCPR, the Human Rights Committee (HRC) is responsible to verify the extent of compliance with fundamental human rights through reviewing periodic reports received from member states as parties (Ibid). Many member states have often refrained from submitting reports under the provision of the Article 40, and/or requested a suspension of the requirement of submitting periodic reports with respect to the measures taken of the human rights mentioned in the ICCPR at the time of emergency (McGoldrick 2004, p. 391).

However, the first part of the paper shortly discusses justification, components, and principles, and in the second part, the author attempts to examine states of emergency whether there are any provisions and measures taken at the time of emergency within the Constitution of Bangladesh and any mechanisms for preventing subsequent abuse of the executive powers with respect to proclamation of emergency.

## Justification of State of Emergency

The question is why do states need to declare emergency situation? Replying to it, it may arise due to varieties of reasons, such as armed conflict which pose threat to the state, any forms of devastating natural disaster, political upheavals, a widespread occurrence of an infectious disease, a sudden economic crisis, or a general strike. No doubt, states of emergency are common in dictatorial regimes, and this condition may continue as long as the regimes last. On the other hand, in some situations, martial law is declared by the military which provides them a special power and authority to act in the process of governance. However, there are other forms of emergency conditions, which include "state of exception," "state of alarm," and "state of siege" (Geneva Centre for the Democratic Control of Armed Forces 2005, p. 1).

## Components and Special Power of a State of Emergency

States of emergency are of two components, such as legal framework and operational framework (Geneva Centre for the Democratic Control of Armed Forces 2005, p. 1). Firstly, legal framework comprises of the constitutional and legislative framework and it illustrates how they deal with emergency situation, while operational framework consists of the organizational structure and strategic plans on how to deal at the state of emergency. It is noteworthy that these two components must be compatible with each other; for instance, it has been pointed out that the legal framework must take into account operational structure and requirements, while the operational requirement must respect the constitutional and legal framework (Geneva Centre for the Democratic Control of Armed Forces 2005, p. 1).

However, the constitution or legislative framework of a country generally highlights the ground that can provide the justification of a state of emergency. The framework normally identifies the emergency procedures to be followed and explains the limits on the emergency powers that may be invoked or the rights that can be suspended (Geneva Centre for the Democratic Control of Armed Forces 2005, pp. 2–3). Each country has its own framework that can provide useful guidance with respect to a state of emergency. However, there are two important international treaties, such as the European Convention of Human Rights (ECHR) and the International Covenant on Civil and Political Rights (ICCPR), which specify that states are to follow some guidelines for a state of emergency; for instance, it needs to provide a well-considered justification of the present or imminent nature of crisis for the declaration of a state of emergency. This declaration must be announced publicly, which may reduce the possibility of a de facto state of emergency (Ibid), and state of emergency must respect the limits provided by the relevant binding instruments of international and national law. It is also important to note that fundamental rights from which there can be no derogation for human rights and relevant measures taken with respect to state of emergency must be made available to the relevant treaty-monitoring bodies; for example, if a state somehow derogates from its obligation mentioned under the ECHR or ICCPR, then, as a requirement, it must report to the secretary general

of, respectively, the Council of Europe or the UN of its derogation for human rights (Geneva Centre for the Democratic Control of Armed Forces 2005, pp. 2–3).

In times of national crisis, special emergency powers are provided to the government through the constitution or other legal measures. However, it is important to note that emergency measures are taken through various ways, such as restriction of freedom of press based on content or fully and prohibition to hold public meetings; domestic military deployment; safe evacuation of people from affected areas to safe place during natural calamities; searching homes and other places without a search warrant; arresting people without any charges; and special legislation to punish those for noncomplying with respect to the regulations of emergency provisions (Geneva Centre for the Democratic Control of Armed Forces 2005, pp. 2–3). However, the main challenges at the time of emergency is to prevent abuses of human rights and to limit absolute power of the government, which may provide a safeguard against allowing the use of special emergency powers to become "the new normal" (Cornell and Salminen 2018, p. 220).

## Provisions Concerning States of Emergency in Bangladesh

Many countries in the world have constitutional measures in dealing with the declaration of a state of emergency. Typically, the executive promulgates a state of emergency; however, there are the three most common approaches found, for example, firstly, as in the case of the USA, the executive may declare the state of emergency and due to procedural requirement it must place to the parliament within a specified period of time. Secondly, adopting more democratic approach as in Germany, the executive may declare the state of emergency, but it must require prior ratification by the parliament before proceeding with emergency measures. Finally, parliament itself may proclaim the state of emergency, for example, Hungary adopts this procedure (Geneva Centre for the Democratic Control of Armed Forces 2005, p. 4).

The question is about how constitutional framework in Bangladesh deal with an emergency situation. The Constitution of Bangladesh, which was in effect from 16 December 1972, at the beginning, did not have any provisions with respect to the declaration of emergency under any circumstances. In exploring the fact, it discouraged the framers of the 1972 Constitution from including the emergency provision because of the continuous abuse of powers during the emergency situation declared by the Governments of Pakistan who ruled from 1947 to 1971 when Bangladesh was a part of Pakistan (Bari 2014, p. 581).

Quite interestingly, new incorporation of emergency provision was observed in the Constitution of Bangladesh within just 9 months and 7 days. It is to be noted that on 22 September 1973, the Constitution (Second Amendment) Act was passed, which introduced a new Part IXA titled "Emergency Provisions" which explains everything regarding the preconditions for the declaration and its continuation of emergency and suspension of enforcement of the civil liberties and fundamental rights during the period of emergency. Due to the failure of the government bodies to manage the swift deterioration or poor performance in the context of economy and law and order situation, given the circumstances, special emergency power could be considered necessary to control the situation (Ahmed 1984, p. 149).

Having reviewed the literature, there are four common types of emergency situation, such as war, subversion, economic crisis, and natural disaster; however, the president of Bangladesh, unlike the presidents of India and Pakistan,[1] has been given the special power and authority through Article 141A of the Constitution to proclaim only two types of emergency, including the emergency of war/external aggression and the emergency of internal disturbances (Bari 2014, p. 582). The question is when the president may declare a state of emergency, the basis of it

[1] Both India and Pakistan through the constitution empower their respective heads of the states to proclaim three types of emergency, such as emergency of war, emergency of subversion, and financial/economic emergency.

consider a situation as a "*grave emergency exists in which the security or economic life of Bangladesh, or any part thereof, is threatened by war or external aggression or internal disturbance*" (Constitution of Bangladesh, Article 141A (1). But clause 3 of Article 141A has empowered the president to declare an emergency, even before the possible threat of external aggression or internal disturbance, but the condition prevails that if he "*is satisfied that there is imminent danger thereof*", which is basically borrowed the concept and wording from Article 352 (3) of the 1949 Indian Constitution (Bari 2014, p. 582).

However, the Constitution of Bangladesh does not have precise expression to limit the power for declaring a state of emergency is declared, if the country experiences a special circumstance that pose threat to the fundamental rights to life and cause serious harms the life of the nation. Furthermore, the Constitution used a very implicit meaning with respect to the notion *internal disturbance*, which basically traces back to colonial legal framework as the ground for declaring emergency. The question may further arise regarding the provision of internal disturbance as a basis for declaring state of emergency; however, in this regard, personal assessment or judgment of the individual authority concerned might play a role for proclamation of emergency, when it comes to internal disturbance in a particular case. It can be pointed out that the Constitution of Bangladesh has not designed any reliable system of checks and balances to inhibit capricious actions for declaring states of emergency, although the Constitution procedurally requires the declaration of emergency to be countersigned by the prime minister (see Constitution of Bangladesh, Article 141A (2).

The Constitution of Bangladesh, which was, later on, amended through the Constitution (Second Amendment) Act, 1973, does not make any attempt to balance between protecting the security of the state and respecting individual's fundamental rights at the time of emergency. The Constitution through the Article 141C (1) has given a special unfettered power to the president during a state of emergency to limit or suspend the enforcement of all or some of the 18 fundamental rights guaranteed by Part 3 of the Constitution.

However, since the incorporation of the Article 48 (3) in the Constitution, the president, who is the nominal head of the state, performs all of his duties and responsibilities based on the advice of the prime minister. It is commonly perceived that the procedural requirement of the countersignature of the prime minister for securing the validity benchmark of the emergency cannot protect from preventing violation of human rights. Given the circumstances, it can be said this kind of countersignature measures can just be said as a "procedural formality" (Bari 2014, p. 583).

The Constitution of Bangladesh also illustrated that there is need for procedural requirement to be approved by the parliament if states of emergency would be continued beyond 120 days (Constitution (15th Amendment) Act, 2011, Section 41(b). It is also worthy to note that if the parliament is not in session when proclamation is issued, then the declaration of emergency could continue till the expiration of 30 days from the date on which parliament first met "after its reconstitution, unless before that expiration of the said period of thirty days a resolution approving the Proclamation" had been passed by the parliament (Constitution of Bangladesh, former proviso to Article 141A (2) (c).

It is noteworthy that the requirement of parliamentary approval for the continuation of an emergency beyond 120 days was taken away by the Constitution through the 15th Amendment Act, 2011. Under the new provision, the president can declare an emergency for 120 days (Ibid., Article 141 A (1), as amended by Sect. 41 (a) of the Constitution through the 15th Amendment Act, 2011) and the parliament has power to allow the continuation of an emergency beyond 120 days (Ibid., proviso to Article 141(2) (c), as amended by Sect. 41(c) of the Constitution through the 15th Amendment Act, 2011). It is stressed that the Amendment Act of 2011 does not incorporate any mechanism in the Constitution for continuation of emergency, which makes convenient for the president to secure continuation of emergency without any difficulty, as it has the support from the majority of lawmakers in the parliament (Bari 2014, p 584).

## Emergency Powers in Bangladesh and Their Impact on Fundamental Rights

During the states of emergency, there is the likelihood of violation of human rights; hence it requires greater safeguard measures in constitutional and legislative framework. For instance, if a country faces with armed conflict or with a sudden natural disaster, states can be easily impoverished to adopt some harsh operational measures to counter internal disturbances or external aggression on the ground that the end justifies the means. Authoritarian regime always attempts to justify the proclamation of emergency on the basis that it avoids threat to the life of the nation which ultimately fulfills the interest of the general well-being. But it is found in authoritarian regime or after assuming power by the military that they basically limit freedoms for their political gain and use it to oppress and repress opposition views and activities, which is considered dangerous for fundamental human rights and goes against public interest (Tessema 2005, p. 13).

Since the incorporation of the arrangement with respect to emergency into the Constitution of Bangladesh on 22 September 1973, emergencies have been declared on five occasions. For the first time, on 28 December 1974, Sheikh Mujibur Rahman declared emergency to safeguard his dictatorial powers and to systematically abolish all kinds of opposition against his regime (Ziring 1992, p. 86). After the armed rebellion that assassinated the head of the state, Ziaur Rahman, on 31 May 1981 a nationwide emergency was declared in order to control the internal disturbances. On 27 November 1987, states of emergency were proclaimed to protect the survival of President Hossain Muhammad Ershad, an autocratic regime. On 27 November 1990, the same regime declared emergency in an attempt to avoid the threats posed to the then dictatorial rule. For the last time, it was declared on 11 January 2007, to allow an unprecedented crackdown on the leadership of the two major political parties, on the basis of maintaining internal disturbances.

Given the circumstances, these declaration of emergencies in Bangladesh have either observed the limited or suspension of civil liberties and fundamental rights in a large extent; for instance, 12 out of 18 fundamental rights, as envisaged by the constitution, during four periods were curtailed and again the country witnessed a full suspension of all the 18 fundamental rights during the last period (2007–2008). It is worthy of note that all the states of emergency proclamation (except the declaration on 31 May 1981) were unjustified; however, from the past experience, the governments always misused the arrangement regarding states of emergency and suspension of fundamental rights as the most effective means for oppressing and repressing any opposition to its rule (Bari 2014, p 584). Last but not least, although Bangladesh ratified to the ICCPR on 6 September 2000, unfortunately the Constitution has not been amended yet to incorporate the seven nonderogable rights which is specified in the ICCPR (Bari 2014, p. 583).

## Conclusion

A state of emergency has received significant concern in governance, which poses threat to possible violation of human rights. In the past, Bangladesh proclaimed states of emergency four times due to mainly political upheavals; however, when it comes into practice, it is found that the objective of the proclamation of states of emergency is not to protect the life of the nation or safeguard human rights, rather it is focused on to protect the authoritarian regime and to discriminate opposition views and their activities.

# Emergency Management, Safety, and Security

Frances L. Edwards and Daniel C. Goodrich
Mineta Transportation Institute, San Jose, CA, USA

## Synonyms

Business continuity; Crisis management; Defense; Prevention; Protection; Safe keeping

## Definitions

Emergency management – the application of public resources to prevent or lessen the impact of a crisis or disaster on an organization or community.

Safety – protection from accidental harm caused by nonhuman forces.

Security – protection from intentional harm planned and executed by human individuals or groups.

## Introduction

The terms emergency management, safety, and security are often used interchangeably. In some languages safety and security are the same word. In some cultures, emergency management is not a government function, but rather a societal or community responsibility. However, all three functions have to be performed by individuals, communities, and societies for protection against unwanted outcomes, such as theft, attack, destruction, and death. Each element has its unique attributes, resource requirements, and strategies, but when they work in harmony that can create a more defended environment in which humans can conduct the business of life unharmed. They will be discussed in their historical order.

## Security

Security is the oldest of the three domains. Earliest humans had to protect their food from animals and other humans to keep their society alive. Their security was organized to defend their group against intentional strategies developed by other intelligent beings to deprive them of their valuable goods, including human and animal members of the group. They developed skills in protecting their valuables through hiding them or defending them with organized force (Edwards and Goodrich 2012).

Today security is still important to every society. Protection is provided to valuable cargo, to a business enterprise, and to people with special value to society. These people may be wealthy and targets for kidnapping for ransom. They may have special scientific skills, making them targets of business espionage. They may have insider knowledge of business practices or government information, making them targets of both traditional and cyber espionage.

**Emergency Management, Safety, and Security, Fig. 1** Four steps to security

Modern security consists of four elements: deter, detect, delay, and defend, as shown in Fig. 1. Individuals and organizations begin to develop security by structuring their facilities, possessions, and movements to deter would-be attackers. This may consist of creating fences around properties, placing sturdy locks on entrances, and using steel bars across windows. Would-be attackers will conduct surveillance and discover that the target has been "hardened," and divert their attention to a facility that would be easier to access. Likewise, for cybercrime, complex passwords and encryption of data will slow the progress of would-be hackers, causing them to turn their attention to undefended sites, in many cases (Edwards and Goodrich 2012).

Detection is the second element of security. Sensors and security cameras are placed at the perimeter of the area of concern, while laser beams, motion detectors, smoke detectors, and hazardous materials detectors are placed inside the area. When triggered, these systems may set off an alarm that notifies the residents, a security company, or guards that someone is trying to access the area of concern. The notification triggers a response from the security company or from local law enforcement. The sounds and lights typically associated with such systems may drive off the intruders because they realize that they have been detected. However, in some cases the delay between the notification of the attempted breach and the actual response may be long enough to permit the intruders to carry out their plan and escape, taking with them valuable possessions, or even a victim. Computer systems likewise need detection devices to notify security staff that an intruder is trying to gain access to the computer's sensitive information. Software can be created to notify information technology security personnel of attempts at entering the system by unauthorized individuals or groups. This may track their IPO addresses, or just note numerous attempts to enter the system with the wrong user name and password combinations. This information can be used to stop the hack, and possibly to investigate the perpetrators (Edwards and Goodrich 2012).

Delay is the third element of security. Safes, multiple layers of barriers, and complex locking systems may slow the intruders down enough to allow outside defenders to arrive and interdict their activity before they are successful in reaching their goal. Time is the primary security element, giving the defenders time to react to the threat, and to devise successful countermeasures and protective actions (Edwards and Goodrich 2012).

When the first three elements fail, defense is the final element. Individuals may employ armed body guards, or use their personal weapons to repel invaders. Businesses will use armed security guards. Government installations may use Federal Protective Services or military personnel. Barbed wire and electrified fencing can make entrance painful or life-threatening. Intruders may be arrested and convicted of a crime, resulting in jail time and at least a temporary end to their security breaching efforts (Edwards and Goodrich 2012).

The US military services defend the nation from enemies, foreign and domestic. The Central Intelligence Agency and the US Department of Homeland Security defend American interests and citizens at home and abroad from terrorist groups. Their work and related regulations are codified in the Code of Federal Regulations. Sheriff and police departments protect communities against crime, based on state laws and local ordinances. Private security firms focus on the protection of businesses and individuals and their valuable possessions, with their actions governed by state and local laws about the use of force and fire arms.

Security is designed to discourage or defeat an intelligent adversary with a plan to access valuable items, data that do not belong to them, or to deprive people of their property, liberty, and perhaps lives. Likewise, computer-based resources may be targeted for financial gain, either directly through acquisition and use of information, or indirectly as ransomware.

## Safety

Safety is the second oldest domain. Safe operations have always been important from the earliest use of tools. People developed both hunting tools and protective clothing to protect themselves from injury when using the tools. Gloves, gauntlets, and armor are examples of early safety equipment that protected the wearer from serious injury. Later, as machinery was introduced and became more sophisticated, safety precautions had to be developed to guide the use of technology to lessen the likelihood of injury to the skilled craftsman.

The modern workplace includes a wide variety of elements that can cause accidental harm to the users. Industrial equipment, vehicles, and business equipment all have the potential to injure the users. To prevent such injuries, businesses have safety rules regarding the personal protective equipment that is required, the type and length of training required, the licensing required, and safe workplace behavior required of equipment operators. All workplaces must have a healthy and safety plan to protect workers from harm by industrial and business applications of equipment and technology. Industries that use hazardous materials have more detailed safety rules regarding the storage, handling, and use of such chemicals to protect the workers and public. These steps have led to a "culture of safety," where employees are aware of the regulations, and look out for each other's safety.

Businesses and government agencies have safety officers whose job is to ensure that activities are conducted in ways that lessen the chance for injury to workers, and procedures for the use of inherently dangerous equipment are developed to protect the operators. Protective clothing is designed to prevent people from being hurt by the machines. The Occupational Safety and Health Administration (OSHA) is the federal-level oversight agency for workplace safety in general. Professions often have unique safety oversight organizations. For example, public transit using heavy rail has safety regulations created by the Federal Railroad Administration. Many states also have state occupational safety and health regulations and oversight organizations, which may have stricter rules than the federal OSHA, or may address areas of concern for safety not addressed nationally.

## Emergency Management

The newest domain is emergency management. When people lived self-sufficient lives with little infrastructure, there was no need for emergency management by the government. Individuals maintained their own emergency supplies, and self-reliance was their way of life. Communities assisted their members with repairing and replacing structures and goods lost to natural disasters. Barn raisings and church charity were common in rural American communities. The advent of urban living, dependence on public infrastructure for essential services like drinking water, sewage disposal, electricity, and transportation, created the demand for community-level emergency management (Edwards and Goodrich 2012).

Civil defense during World War II developed into a community-wide system of sirens and fallout shelters during the Cold War. In 1979, after the confused communication surrounding the Three Mile Island nuclear power plant accident, President Jimmy Carter created the Federal Emergency Management Agency (FEMA), a merger of agencies and programs from the Department of Defense, the Department of Commerce, the Department of Housing and Urban Development, and the Office of the President. The Robert T. Stafford Act was passed in 1988 to define federal financial assistance to states experiencing natural disasters. The following year, the Federal Emergency Response Plan was created, to define

the assistance available from federal agencies for communities whose resources were exhausted by disaster response. The plan was built around 15 Emergency Support Functions (ESFs), with a lead agency and supporting agencies for each. For example, ESF 1 is Transportation, with the US Department of Transportation in the lead, and eight supporting organizations, such as the Department of Defense and Department of Agriculture.

Emergency management agencies exist at all levels of government. It is FEMA's perspective that all disasters are local. Individual communities should conduct a Threat and Hazard Inventory and Risk Assessment (THIRA) to determine what natural, technological, or human-caused events are most likely to occur in the community. The assessment allows the community to plan for the four phases of emergency management. The municipality may recognize that its resources are likely to be limited in a major event, and it can declare a local emergency and request assistance from other levels of government. The county would be the next level of government to assist. If its resources, including budgets, are constrained, the request for support goes to the state, where the governor may declare a state of emergency, and open the state resources to the impacted areas. If the state's resources are also overwhelmed by the event, the governor or the legislature may request a presidential state of emergency for specific limited resources, or a presidential declaration of major disaster, which opens financial public assistance and individual assistance programs to communities and residents.

FEMA defines four phases of emergency management, which occur as an overlapping cycle, as shown in Fig. 2. These are mitigation/prevention, preparedness/planning, response, and recovery. The first two should be occurring all the time, while the last two are triggered by natural, technological, or human-caused disasters.

During the mitigation/prevention phase, emergency management leaders use the THIRA to consider what steps can be taken to lessen the impact of an event on the residents and infrastructure, or in some cases, even prevent the event from

**Emergency Management, Safety, and Security, Fig. 2** Four phases of emergency management (FEMA 2006)

occurring. Examples of mitigation would include the creation of building codes and code enforcement to ensure that the built environment is capable of withstanding the impact of an anticipated disaster event. For example, buildings and freeways in California are built to withstand the estimated level of shaking from a scenario earthquake. Proof of the success of such regulations can be found in the relatively low loss of life experienced in California earthquakes, where building codes are strictly enforced, as compared with similar events in nations without such codes, as shown in Table 1.

Federal mitigation funding may also be available to buy out properties that are subject to repeated losses, such as from flooding, allowing residents to move to a safer location, and leaving the flood-prone areas to be used for parks. Disease mitigation may be achieved by vaccination programs, and financial mitigation can be developed by encouraging residents to purchase flood insurance for their properties in flood-prone areas.

Prevention may be more effective against human-caused events, where early intervention may stop an attack while it is being planned. Prevention includes surveillance of at-risk facilities, developing intelligence about criminal and

**Emergency Management, Safety, and Security, Table 1** Comparative earthquake deaths and injuries

| Year | Magnitude | Event | Location | Deaths | Injuries |
|---|---|---|---|---|---|
| 1988 | 6.8 MM | Armenian Earthquake | Northern Armenia, USSR | 4202 (49% of population) | 1244 (14% of population) |
| 1989 | 6.9 MM | Loma Prieta Earthquake | San Francisco Bay Area, California | 63 | 3757 (0.0004% of the population) |
| 1994 | 6.7 MM | Northridge Earthquake | Los Angeles County, California | 57 | 9000 (0.0007% of the population) |
| 2003 | 6.6 MM | Bam Earthquake | Iran | 40,000+ (35% of population) | 20,000 (14% of population) |

terrorist groups who might plan community harm, and sharing intelligence through regional fusion centers that include law enforcement, fire service, emergency medical service, public health specialists, and medical care providers. A well-known example of successful terrorism prevention is the attempted bombing of the Los Angeles Airport in 1999, known as the Millennium Plot. The terrorists attempted to import explosive materials, crossing the US border from Canada. The perpetrator was a disaffected Algerian refugee who took terrorism training in Afghanistan. He filled the wheel well of his rented car with homemade explosives and took the ferry from Vancouver to Seattle. The US Customs and Border Patrol officer became suspicious of his answers, and ordered a routine search of his car trunk, where the explosives were found.

Planning is the element that allows local officials to evaluate the THIRA events, and determine the likelihood of the events occurring, based on science, history, and observation. They then determine the vulnerabilities of the community's build environment and residents, and create plans for all four phases of emergency management to lessen harm, protect the population, and speed community recovery. Such plans include a community emergency response plan, a continuity of operation plan, a continuity of government plan, and a community recovery plan. A mitigation plan is then created to invest in actions that will result in lowered vulnerability for the natural and built environments.

Preparation involves all elements of the community. The local government, in conjunction with nongovernmental organizations (NGOs), will generally lead a community outreach and education program to inform the residents and business community about the THIRA, the vulnerabilities and consequences of the identified threats, and encourage action on the part of the community members. Classes may be offered in home and personal preparedness, business emergency planning and preparedness, and school planning and preparedness. Residents and businesses are encouraged to participate in the Community Emergency Response Team (CERT) training to provide neighborhood-based emergency response. Activities include preparing the home to be disaster resistant through bolting foundations, strapping large furniture, and stockpiling essential goods.

Response is generally managed by the fire service, emergency medical service, law enforcement, emergency services, planning/building, and public works departments. Tasks include rescuing and treating victims, traffic management, protection from looting, debris removal, damage assessment, and establishment of the emergency operations center using the emergency operations plan. Care and sheltering is provided by the parks department and local NGOs. Mutual aid from other jurisdictions augments police and fire services. After appropriate local and state declarations, and a presidential declaration, assistance will also be provided by the federal government, using the ESFs discussed previously.

Recovery is a collaboration between the public and private sectors. Residents, businesses, and the local government are expected to carry insurance policies against the known (from THIRA) perils, including flood insurance, wind insurance, earthquake insurance, worker's compensation insurance, and liability insurance. These form

the financial base for recovery from the disaster, augmented by federal public assistance and individual and household assistance programs. Local recovery plans should include rapid permitting processes for repair and reconstruction of existing buildings and infrastructure. State agencies may be responsible for road reconstruction. Federal funds will support disaster unemployment payments, psychological counseling, and child care costs during recovery. Recovery is the time to "build back better," as FEMA said after Hurricane Katrina. New zooming taking into account the revealed perils in the community may help to prevent a recurrence of the same losses. This leads into mitigation, where new initiative can be taken with federal funding support to make the community less disaster prone in the future.

Thus, emergency management takes the whole community through the four-part cycle, creating a safer and more resilient future.

## Conclusion

While the terms emergency management, safety, and security may be used interchangeably in many societies, there are distinct differences among them. Emergency management is a public management process to prevent or lessen the impact on a community of unwanted events that cannot be adequately foreseen, or prevented from occurring, to lessen the harm done. Safety is a managerial activity that anticipates harm to individuals or groups from unintentional accidents, often related to technology, and provides administrative actions and regulations to lessen the harm. Security considers purposeful acts by humans that are intended to steal, harm, damage, or destroy goods, facilities, or lives, and designs mechanisms and systems to make these events less likely to occur.

# Emergency Operations Plan

Lucien G. Canton
CEM, San Francisco, CA, USA

## Synonyms

Disaster operations plan; Disaster plan; Disaster preparedness plan; Emergency management plan; Emergency plan; Emergency preparedness plan; Emergency response plan

## Definition

Emergency operations plans are plans that define the scope of preparedness and emergency management activities necessary for an organization to respond to an emergency or disaster. The term is most frequently used to describe an operational level plan that coordinates the response activities of multiple agencies and departments within a jurisdiction.

## Origin and Underlying Principles

The emergency operations plan is intended to address the two types of needs or demands generated by disasters. The first type consists of agent-generated needs, those needs that are created by the specific nature of the disaster itself. For example, the demands created by a flood differ from those generated by an earthquake. The second

category consists of response-generated needs, those that are created by the jurisdiction's actions in response to the disaster. Where agent-generated needs will vary by disaster, response-generated needs tend to remain constant. While floods and earthquakes may create different problems, both require similar response activities, such as sheltering, medical assistance, and evacuation (Dynes et al. 1981). Emergency operations plans represent an attempt to identify and standardize strategies to meet response-generated needs while identifying the unique differences among hazards that create agent-generated needs. Understanding the two types of needs present in a disaster is the key to understanding the concept of all-hazards planning that forms the basis of the emergency operations plan. "All-hazards" does not mean having a plan for every possible hazard faced by a community. Rather it makes use of the concept of response-generated needs to develop strategies for addressing those common needs present in all disasters. This results in a plan that has applicability to all disasters and can provide a starting point to responding to unexpected events. This also simplifies planning for specific hazards; planners are able to focus on the unique needs generated by the hazard without having to construct a plan that addresses all the needs of the specific disaster.

The concept of the emergency operations plan evolved from military war planning. During the Cold War era, the federal government provided funding for nuclear war planning positions at local and state levels. These positions were typically filled by retired military officers with experience in planning. These officers applied the concepts and formats with which they were familiar: a basic plan supplemented by annexes which are in turn supplemented by appendices and tabs. As time passed, these war planning positions were increasingly used for natural hazards planning under the dual-use doctrine, and these plans eventually evolved into the all-hazards model used today. By this time, the military planning model was firmly entrenched as the format for emergency operations planning and codified in federal guidance documents beginning with *CPG 1–8 Guide for The Development of State and Local Emergency Operations Plans* (FEMA 1990) and culminating in the current guidance in *CPG 101 Developing and Maintaining Emergency Operations Plans* (FEMA 2010).

The typical emergency plan consists of three elements:

1. *The basic plan*, which provides the overall concept of the jurisdiction's approach to response. This element assigns responsibility for specific operational tasks to departments and agencies, describes overall coordination processes and legislative authorities, and establishes administrative procedures for maintaining the plan.
2. *Functional annexes*, which provide details on the performance of specific operational functions. These functional annexes are sometimes subdivided into emergency support functions which deal with operational functions such as sheltering and evacuation and support functions which provide support to the overall response, such as logistics and finance. Functional annexes are not plans in themselves. Rather, they provide the concepts and information needed to develop supporting plans. They identify lead and supporting agencies, operational goals, available resources, funding, and other related information that have been coordinated during the planning process.
3. *Hazard-specific annexes*, which address the unique needs generated by specific hazards. Where the basic plan and functional annexes address response-generated needs, the hazard-specific annexes focus on agent-generated needs unique to a specific type of hazard. For example, an annex for flooding might include pre-identified evacuation routes and specific assignments to departments and agencies for supporting evacuation. By their nature, hazard specific annexes tend to include more detailed planning than functional annexes.

## Concepts and Planning Methodologies

To develop an effective emergency plan, one first needs to understand the context within which the

plan is used. The emergency plan is not an end in itself and is not intended to be the sole determinant of response activities. In each crisis there are three levels of operation (Canton 2007):

1. *Tactical* – the responders who are providing direct services to the affected population. Tactical responders need detailed, specific plans and procedures that focus on their assigned mission. Their event horizon is extremely short term, often measured in minutes.
2. *Operational* – the people who are coordinating and supporting tactical operations. This coordination typically occurs at an emergency operations center using a multiagency team. This team attempts to anticipate the needs of the responders and to "jump ahead" of the disaster. The event horizon here is measured in hours and days, with emphasis on information collection and analysis and on resource management.
3. *Strategic* – senior officials tasked with determining the long-range impact of the event and anticipating recovery issues. The event horizon for strategic planning tends to be long range, typically measured in months and years.

The emergency operations plan is intended to provide structure to the operational level. It is informed by the overall community strategy for disaster response. Such a strategy is based on factors such as the overall risk tolerance of the community, its vulnerability to hazards, and the resources and capabilities available for response. Those resources and capabilities are applied to response through the tactical level plans for each department and agency. The emergency operations plan is the mechanism used to synchronize those various plans in order to support a coordinated response.

Emergency operations plans are also reliant on other community plans. For example, continuity of government plans are intended to maintain essential government functions during a crisis. Supporting this mission are the continuity of operations plans that ensure the continuance of essential functions within each department or agency. Since most emergency operations plans assume that essential government functions will continue during a crisis, the success of the emergency operations plan hinges on the success of the continuity of government and continuity of operations plans. The purpose of the community emergency management program is to ensure that these various plans are synchronized.

Effective emergency operations plans are risk based. This begins with an understanding of the various hazards faced by the community. However, the mere existence of a specific hazard does not mean that that hazard poses a significant risk to the community. Risk is determined not only by the type and severity of the hazards facing a community but is ultimately a function of the community's vulnerability to a specific impact. That vulnerability can be reduced through mitigation efforts, for example. Ultimately, risk is a balancing act involving multiple variables. Rather than representing an absolute, it is instead an estimate based on the best available information.

As risk analysis is an imperfect science, emergency plans are based on assumptions. Some of these assumptions are identified in the plan itself, but many are unspoken assumptions, such as the assumed survival of key facilities and personnel or the continuance of essential government functions. It is important when developing an emergency operations plan to consider what assumptions are being made. Changing an assumption could have a major impact on the effectiveness of the plan.

Emergency operations plans are most effective when planning includes the participation of agencies and organizations that can provide a wide range of skills and perspectives (Kartez and Lindell 1987). Consequently, these plans are typically developed by interagency teams representing various stakeholders involved in plan implementation. This team not only includes government departments and agencies but may also include voluntary agencies, such as the Red Cross and Salvation Army, community groups such as Community Emergency Response Teams (CERT) and radio amateur clubs, and utilities and major corporations.

Emergency operations plans are generally developed using one of three methodologies:

1. *Functional planning* – This is by far the most common approach to emergency planning. In this methodology, planners identify the particular functions that will be needed to respond to a disaster. These functions are then assigned to one or more lead agencies who have responsibility for developing supporting plans and overseeing implementation of those plans during an actual event. *CPG 101* provides a sample list of some 26 separate functions that might be performed in a response operation, each of which would require a separate plan annex. The federal government has evolved a more focused system used in the *National Response Framework* that identifies a series of 15 emergency support functions. These emergency support functions are supplemented by nine support functions. The functions identified in both systems are geared toward response-generated needs. Agent-generated needs are addressed in separate hazard, threat, or incident specific annexes.
2. *Capability-based planning* – This type of planning is similar in some ways to functional planning in that it attempts to identify the capabilities that will be needed in a disaster. However, where functional planning considers broad categories, capability-based planning looks at a desired outcome and focuses on what will be needed to achieve that outcome. For example, functional planning may assign responsibility for hazardous material response to the fire department. Capability-based planning considers the desired outcome of a successful hazardous material response based on an analysis of a number of potential scenarios and identifies the specific resources need to achieve that outcome.
3. *Scenario-based planning* – The methodology of scenario-based planning shifts the emphasis away from response-generated needs to agent-generated needs. In this type of planning, planners base plans on one or more specific scenarios and then determine what will be needed to respond to those specific events.

It is a common mistake to commit to a single planning methodology for all planning. This was the mistake made by the federal government following September 11 when it committed to capability-based planning as the national planning model at all levels of government. The result was an overcommitment to tactical planning at the expense of coordinated operational planning.

Each planning methodology has its strength and weaknesses, and these must be matched to the needs of the type of planning taking place. Functional planning is extremely effective in formulating the emergency operations plan because it considers broad functions, assigns responsibilities, and lays out specific goals for response operations. It does not, however, address tactical issues well, as it is not specific enough. This is where capability-based planning is more effective, as it provides the level of specificity called for in tactical operations. Scenario-based planning is most effective in developing hazard-specific annexes where a detailed scenario can be used to identify unique resource requirements for a hazard.

## Common Problems with Emergency Operations Plans

As has been mentioned, the emergency operations plan evolved from military war planning. However, the military planning model did not translate well to the civilian system and carried biases that are still present in planning today. Russel Dynes (1994) identified six consequences of the adoption of the military planning system:

1. An assumption that disasters will produce social chaos
2. An assumption that the coping capacity of individuals and the social order will be reduced
3. The creation of artificial social structures to deal with reduced coping capacity
4. Lack of confidence in the decision-making capabilities of people and social structures
5. Top-down decision-making
6. Creation of a closed system intended to overcome perceive weaknesses in the social structure

This was compounded by a lack of understanding of the context of military planning. The type of plans developed by military planners assumes a homogeneity among those executing the plans. Consequently, they do not contain basic information that was assumed to already be part of each soldier's basic training. More importantly, military war plans were, in essence, contingency plans. They were never intended to be operational plans and so are cumbersome, making specific information difficult to find. Nevertheless, the military planning model has been reinforced by use over time and now forms the basis for most emergency operations plans in the United States.

## Conclusion

The federal guidance for emergency operations plans has reinforced the use of the military planning model and encouraged the creation of large, cumbersome plans that include considerable information. However, this top-down approach means that emergency operations plans are written to meet needs other than those of the end users. While *CPG 101* specifically allows modification of the plan templates it provides, the use of these templates as measurements of conformance in activities such as the National Plan Review has made these sample templates a de facto standard, and the assumption is that all elements in *CPG 101* must be included in the emergency operations plan. The result is a plan written to meet a standard rather than one designed for ease of use. As a consequence, emergency operations plans tend to be bulky, to contain material irrelevant to the end user, and to make information needed by the end user difficult to find.

# Emerging and Reemerging Infectious Diseases and Crisis Management

Bruce Binder
Global Vision Consortium, Inc., Rochester, WA, USA

## Definition

Infectious diseases are caused by pathogenic microorganisms, such as bacteria, viruses, parasites, or fungi. The diseases can be spread, directly or indirectly, from one person to another. Zoonotic diseases are infectious diseases of animals that can cause disease when transmitted to humans. Emerging infectious diseases are ones that have not been seen in a particular community before. Reemerging means it has reappear after absence for some time.

## Introduction

Emergency management and crisis management (Crisis, disaster, catastrophe in English, translation and definition "crisis, disaster, catastrophe", Dictionary English-English online) are sometime used

to identify a process of preparedness, response, recovery, and mitigation. While emergency management is usually associated with governmental actions, crisis management is usually associated to what individual organizations and companies do. Crisis management includes activities and processes which help organizations to analyze and understand events which might lead to crisis and uncertainty in the organization. Crisis management enables the managers and employees to respond effectively to changes in the organization culture. It consists of effective coordination among the departments to overcome emergency situations.

In this presentation, the author looks at what is meant by infectious diseases, how and from where they emerge, what is crisis management, and what are the concept and principles used in responding to an outbreak of an infectious disease.

## Infectious Diseases Have Been Part of Human Existence in Pre-history Times: Millions of People Have Died. No Portion of the World Has Escaped

What was the earliest infectious diseases to impact humans is unclear. A human skull dating to 2000 B.C. (Robins et al. 2009) has been found in India showing signs of leprosy. Leprosy is contagious through contact with fluids between people (Bushak 2015).

According to the World Health Organization (WHO): "Infectious diseases are caused by pathogenic microorganisms, such as bacteria, viruses, parasites or fungi; the diseases can be spread, directly or indirectly, from one person to another. Zoonotic diseases are infectious diseases of animals that can cause disease when transmitted to humans." (World Health Organization definition of infectious Disease per WHO on-line website.) Throughout recorded history, certain infectious diseases have altered the history of human. A short list includes smallpox, syphilis, HIV, AIDS, influenza, bubonic plague, cholera, malaria, and yellow fever (Shulman 2008).

History records the most deadly infectious disease outbreaks (The Five Deadliest Outbreaks and Pandemics in History, RWJF Public Health blog, Published Dec 16, 2013) as:

(1) Bubonic plague struck China, India, and Hong Kong in 860. Over 12 million people died from this outbreak of plague.
(2) Bubonic plague reemerged in China in the early 1300s and died down in Europe in 1351. It is estimated that between 75 million and 200 million people died.
(3) Smallpox epidemic in Mesoamerica began in 1519. Brought by the Europeans, the native population had no immunity to smallpox and other European diseases. There are not quality records, but it is believe that out of the 25 million people who lived in Mesoamerica in 1519, less than 2 million inhabited that area in 1620.
(4) Smallpox reached Massachusetts in 1633. It is estimated that smallpox and other European infectious diseases killed an estimated 20 million Native Americans.
(5) H1N1 flu pandemic happened between 1918 and 1921. As many as 30 and 50 million died worldwide.
(6) HIV/AIDS was identified in 1981; it is believed to have been in the human population for at least several decades before it was recognized. As of 2011 over 25 million people have died and at least 60 million infected. While it can now be managed as a chronic condition, many parts of the world do not have the medical infrastructure to do so. In 2017 in sub-Saharan Africa, it was estimated that one in five adults was infected.
(7) Cholera was first identified in Calcutta, India, in 1817; it has and continues to kill millions. While it can be treated with proper public health measures and medical intervention, the World Health Organization (WHO) estimates that 5 million new cases of cholera occur each year.

## How Do Infectious Emerge into the Population? Why After Burning Out, Why Do They Reemerge?

### Jump from Species to Species

Infectious diseases can emerge by moving from one species into another. Examples include smallpox, diphtheria, dengue fever, yellow fever, influenza (flu), and Ebola.

### Viruses

For purpose of explaining how viruses jump from one species to another, we will look at how influenza emerges into a population. Peasants in China and other Asian societies live close to their livestock. This closeness allows for influenza (flu) viruses that are common in chickens or pigs to mutate their genetic makeup enough to infect the person living close to them. When the original host is a bird, the resulting flu is referred to as avian flu. If the original host was a pig, the flu is referred to as a swine flu. Once a person is infected, the virus may continue to mutate, allowing it to more easily pass to other people near the person infected. This ring of exposed people expands over time. The sick person comes in contact with other people, exposing these new people and over time infects geometrically more people. Only after the virus has mutated so that it can be passed easily from human to human does the virus pose a major threat to human populations. With modern transportation, an infection that starts in one part of the world can reach the entire world in a matter of days, weeks, or months. After the flu infects much of the community, heard immunity means that the virus has trouble finding new people to infect. Thus the outbreak burns out but remains in the population for many years.

Over the past several years, a variant of the H1N1 virus has circulated worldwide. It is similar, but not the same strain that caused the 1918 pandemic. In 1918–1921 the H1N1 killed young adults in numbers not seen since. The current variant of H1N1 continues to make people of all ages ill. However most deaths related to H1N1 occur in primarily the very young and the elderly.

H3N2 is a swine flu virus. It was the cause of the Hong Kong flu pandemic of 1968 (Influenza A (H3N2) Variant Virus https://www.cdc.gov/flu/swineflu/h3n2v-cases.htm). Sporadic infections of H3N2 have continued to be detected since that time. H3N2 mutated again in the Southern Hemisphere in 2017 (Australia's flu season has U.S. health officials bracing for a bad winter – and wishing for a new vaccine, published 1.8.18. http://www.latimes.com/science/sciencenow/la-sci-sn-flu-season-h3n2-story.html). In 2016/2017, the flu vaccine used worldwide was 34% effective against H3N2. Based on the experience in Australia in 2017/2018, the 2017/2018 vaccine (similar to last year's vaccine) is now expected to be only 10% effective (Morley 2017). The severity of associated illness and the death rates related to this virus is expected to be significantly higher in a normal flu season.

H7N9 is a newer strain identified in China in 2013. It has been seen in 2017 in the Southern Hemisphere. So far, there is a high death rate associated with this stain. In China, 88% people who were infected with H7N9 virus later developed pneumonia, and 41% died (Walsh 2017). While H7N9 is currently highly lethal, many times when an infectious disease is passed through a population it loses some of its strength. It is hoped that as H7N9 moves through more people, it will mutate to become less lethal.

Seasonal flu can originate anywhere in the world. Usually seasonal flu is caused by a virus that originated in Asia. The flu virus usually moves from Asia to the Southern Hemisphere communities before traveling to the Northern Hemisphere (Kenah et al. 2011). This usually provides time for public health officials to predict what strain of flu should be part of any vaccine. Deterring what should be in a flu vaccine is an imprecise art. Sometimes the flu strain that hits the Northern Hemisphere has muted again, making the vaccine less effective, or the Northern Hemisphere is hit by a different virus that was included in the vaccine. While this has been the pattern in the past, international air travel, linking Asia to countries in the Northern Hemisphere continues to get more active. It is possible that in the future, the Northern Hemisphere will be impacted by a virus that comes directly from Asia.

### Ebola

It was first discovered in 1976 near the Ebola River in what is now the Democratic Republic of the Congo. It sickened 600 people. Nearly 20 years later, in 2005, researchers found five strains of Ebola hidden in three species of fruit bats in Gabon and the Republic of the Congo. Four of the five strains can be spread to humans. The fifth strain can be spread to other non-human primates (About Ebola Virus Disease Information webpage: Centers for Disease Control and

Prevention, National Center for Emerging and Zoonotic Infectious Diseases (NCEZID), Division of High-Consequence Pathogens and Pathology (DHCPP), updated February 18, 2016 ).

On August 24, 2014, the Democratic Republic of the Congo (DRC) Ministry of Health notified the World Health Organization (WHO) of an outbreak of Ebola virus disease (EVD) in Equateur Province. The index case was a pregnant woman from Ikanamongo Village who butchered a bush animal. She became ill with symptoms of EVD, reported to a private clinic in Isaka Village, and died on August 11, 2014. Local customs and rituals associated with death meant that several health-care workers were exposed to Ebola virus. A total of 66 cases, including 38 laboratory confirmed cases, and a total of 49 deaths were reported. Without international cooperation, this emerging and deadly infectious disease would have sped throughout Africa and eventually worldwide.

People get the Ebola virus through direct contact (through broken skin or mucous membranes in, e.g., the eyes, nose, or mouth) with blood or body fluids (including but not limited to urine, saliva, sweat, feces, vomit, breast milk, and semen) of a person who is sick with or has died from Ebola. They get it by coming in direct contact with:

- Objects (like needles and syringes) that have been contaminated with body fluids from a person who is sick with Ebola or the body of a person who has died from Ebola
- Infected fruit bats or primates (apes and monkeys)
- Contact with semen from a man who has recovered from Ebola (e.g., by having oral, vaginal, or anal sex).

### Hiding Is an Unrelated Population

Infectious diseases can emerge after being isolated in a population. The historical example of the deadly impact of a number of infectious diseases on Native Americans when exposed to people from Europe demonstrates this vehicle of transmission. A second example is the introduction of cholera to Haiti by disaster responders from Europe after the 2010 Haitian earthquake. Today cholera is endemic in Haiti.

Bubonic plague first devastated China in the 800s. After it burnt out, it remained in the population of China. In the 1300s, carried by the merchants and rats on the spice road to Europe, bubonic plague move to a new population of people on the steps of Asia. Records of that time record major outbreaks of illness and death along the route. By the mid-1300s, sailors who were part of the commercial trade from Asia brought the illness to Italy. From Italy, bubonic plague spread throughout Europe. Europeans of the 1300s had no immunity to bubonic plague. It is estimated that between 1/3 and 1/2 of the population of Europe died from this disease between 1347 and 1351 ("The Black Death, 1348," Eye Witness to History, www.eyewitnesstohistory.com (2001)).

### Other Common Factors

In addition to the two vehicles of spread discussed above, there are several common factors that appear most often when an infectious disease reemerges.

- Climate change has brought higher temperatures to higher latitudes, thus providing more opportunity for tropical and sub-tropical diseases to move to new territory. Examples include the Zika virus and dengue fever. Harsher winters mean more people congregate in indoor spaces, encouraging passing of the virus by coughs, sneezes, or hand-to-hand contact.
- "Overuse" worldwide of antimicrobial agents and pesticides. The reemergence of drug-resistant illnesses such as tuberculosis is directly attributable to the high misuse of antibiotics. Many pesticides have become ineffective in keeping malaria-carrying mosquito under control.
- Poor community health: close physical crowding, lack of proper sanitation, poor hygiene, and lack of effective vaccination lead to the occurrence of highly lethal infectious diseases.

### Fighting Back

Over the last 125 years, significant improvements have made many public infrastructure systems. Potable water systems in many nations are safe to drink. Changes in food safety and sanitary sewer systems have also reduced the spread of diseases. Around the world, where government funds have been spent to improve water, waste, and food infrastructure, the health of the public has been improved. Outbreaks of dysentery, cholera, severe repertory viruses, Ebola virus, etc. continue when communities have not invested in their public water, waste, and food infrastructure.

#### Antimicrobial Agents

Beginning in the late 1930s and early 1940s, the development of antibacterial agents has kept many bacterial infectious diseases under control. Diseases like tuberculosis were no longer the major killer that they had been in the past. Unfortunately, throughout the world, the overuse of antimicrobial agents have resulted in the reemergence of many infectious diseases. Diseases that were no longer the killer of millions have become resistant to antimicrobial agents. We are on the edge of a "post-antibacterial" age. The reemergence of malaria, tuberculosis, and other killers are again becoming the major threat to people's health and lives. One study (Tabish 2009) found that 53% of emerging infectious diseases (bacterial or rickettsia) were drug-resistant microbes. Unless a new approach is discovered, we are likely to be headed into a post-antibiotic world. Vanished killer infectious diseases will reemerge and once again take millions of lives.

#### Vaccinations

No major pharmaceutical discovery has impacted viruses like the discovery of antibiotics has tamed bacterial infections. Instead, viruses have been attacked by the development of focused vaccinations. Many viruses that killed millions of children in the 1900s have almost been eliminated or almost eliminated. Some have begun to reemerge as populations forget how deadly these diseases were before vaccines were developed. People die when not enough people have immunity provided them by vaccination.

## Crisis Management, Organizing the Fight

There are several public health concepts used to keep outbreaks of infectious diseases under control or fighting it when it occurs. They are early detection and isolation, vaccination/antimicrobial agents, repairing the public systems that deliver potable water, safe editable food, and sanitary waste disposal. Two-way communication with the communities impacted or potentially impacted is always necessary to getting information from the people and allaying their fears. All of these are ways that governments or societies prepare for and respond to an outbreak of an infectious disease.

The World Health Organization, the US Centers for Disease Control and Prevention (CDC), and the similar organizations (Major International Health Organizations, International Medical Volunteer Organization; http://www.imva.org/Pages/orgfrm.htm) operate to promote the health of populations work together to identify emerging and reemerging infectious diseases. Two WHO definitions help understand crisis management relating to infectious diseases. WHO defines a health risk or threat as "event, incident, condition or agent, which by its presence has the potential to rapidly harm, directly or indirectly, an exposed population, sufficient to lead to a crisis." A public health crisis is "a sequence of events following a public health threat, where the limited time available for deciding and the large degree of uncertainty leads to overburdening of the normal response capacity and undermining of authority." Using crisis management in response to emerging infectious diseases includes (1) identifying the cause of the outbreak, (2) mitigating the impact of the outbreak on the organization, its employees, and customers, (3) working with government agencies to provide factual information to the community, (4) implementing a plan to continue critical operations (COOP), and

(5) communicating with officials, employees, customers, and other stakeholders. This is true when the infectious disease is Ebola in Africa or seasonal Avian flu in the United States.

Partnering with WHO, the national public health agencies of the several impacted African countries (1) identified the cause of the outbreak, (2) Using classic epidemiological techniques to determine which communities and individuals had been impacted, (3) provided supportive care for those suffering from Ebola while trying to isolate them from those who did not yet have the disease, (4) searched for new cases, (5) isolated those new cases, and (6) educated the communities about why the disease had impacted their community and what they could do to limit their risk. Through this effort, the outbreak was contained to a limited geographic area of Africa, with the exception of several responders who carried the disease back to their home country. These responders were placed in medical isolation. Ebola did not take root in their home country.

These tasks require local citizen willingness to talk to public health officials. This is not always easy where community and government do not trust each other. Stopping contagious and deadly diseases, in countries that do not have well-developed and funded public health programs, requires a willingness on the part of the country to accept international assistance. The international community must be willing to provide both professionals and funding. Without that partnership, the disease can spread beyond local containment and potentially impact the entire world.

Viruses can and do mutate anywhere in the world. The 1918 H1N1 flu may have jumped species in the central United States. "The name of Spanish Flu came from the early affliction and large mortalities in Spain where it allegedly killed 8 million. However, a first wave of influenza appeared early in the spring of 1918 in Kansas and in "US military camps." At any time viruses of different strains are impacting different parts of the world. Combatting the flu relies on the same principles of crisis management discussed above. First, companies and organizations must identify how the crisis is likely to impact the organization, employees, and clients. Second: what role can they play in stopping the spread of the illness. Second, how can they support the government effort, their employees, and clients? Third, implement their internal continuity of operations plans. Fourth, support efforts to provide factual information to people impacted as well as their employees, clients, and stakeholders.

## Conclusions

Infectious diseases have been part of human history since prehistory. Infectious diseases (1) jump from one species (birds, swine bats, fleas, monkeys, etc.) to humans, (2) emerge from a community that has already been exposed and now comes in contact with people who have not been exposed to the disease, (3) have become resistant to antimicrobial pharmaceuticals, (4) expanded their home territory due to climate change, and (5) take advantage in poor community health (close physical crowding, lack of proper sanitation, poor hygiene, and lack of vaccination).

Government efforts are defined by the principles of emergency management and public health. These principles rely on the help of the population and include (1) identifying the cause of the outbreak, (2) using classic epidemiological techniques to determine which communities had been impacted, (3) providing supportive care for those suffering from the illness while trying to isolate them from those who did not yet have the disease, (4) searching for new cases, (5) isolating those new cases, and (6) educating the communities about the outbreak and what they could do to limit their risk.

Crisis management principles are the core of how private organizations worldwide response to these emerging or re-emerging infectious diseases. In many ways, the success of the overall effort to contain these emerging diseases are dependent on the success of the response to get people who have had the disease, have the disease on both the public efforts (emergency management) and private and organizations efforts (crisis management). Both must work together to contain and defeat these deadly diseases.

# Emerging Female Entrepreneurial Leaders

Pamela D. Andrews
Amela Consulting, LLC, North Las Vegas, NV, USA

## Synonyms

Emerging leadership; Entrepreneurial leadership; Entrepreneurial learning; Female enterprises; Microenterprises; Social networking; Women-owned small business

## Definitions

- *Women small business owners (WSBO).* Female entrepreneurs who own 51% and manage the day-to-day operations and core service offerings of their venture
- *Microenterprise (ME).* For this study small, business owners with ten or less employees
- *Emerging leadership.* Activities that increase capacity for growth and goal achievement through organizational transformation, which affects the broader environment: (1) agent of distribution or change or (2) close alignment to group norms and ideals
- *Socially constructed network.* Self-directed, self-learning networks which require trust, autonomy, confidentiality, and the building of relationships which allow for honest and processed discussion and feedback on business problems and opportunities
- *Social network analysis.* Examination of the relationships created that allows us to question not just the type of network, but the outcomes from participation in said networks

## Introduction

Female small business owners are no stranger to adversity and obstacles. Women-owned enterprises continue to rise despite the barriers and numerous challenges to their intelligence, capabilities, and leadership in almost all business sectors, including government, technology, retail, entertainment, healthcare and social services, communication, and education. Women are stepping forward to not only meet the needs of their communities, but they are contributing to the larger global economy. Female small business owners remain the fastest growing small business demographic. According to a study conducted by the National Women's Business Council, minority small business owners cite work-life balance, lack of better choices, seizing an opportunity, and job creation as key reasons for starting a business

(NWBC 2016a). African American female entrepreneurs comprised over 1.5 million business owners in 2012, which was an increase of 178.1% from 2002 to 2012. Furthermore, global studies highlight female firms are contributing to economic growth and reducing the rate of poverty around the world by creating jobs for themselves and enriching their communities, employees, suppliers, and stakeholders within their network.

Entrepreneurs have considerable hurdles to stay open and competitive, but small business owners may find it even more challenging to create a growing business in the year filled with tremendous uncertainty. As we move into 2021 and begin a new decade, female entrepreneurs have the potential to emerge as leaders – entrepreneurial leaders inspiring innovation, creating new cultural norms, enriching the economic landscape for more women and minority communities, and garnering the social influence for significant positive change. The global marketplace dealt with increasing ambiguity and numerous disruptions in 2020. Small business operations include managing complexity, networking effectively, making daily decisions, and leading everyday operations. Leadership is critical to understanding how to sustain operations until solutions are uncovered and some assurances that the macro-economy will resurge. Seizing new and current opportunities as the economy rebounds takes innovative leadership and networks with resources that enable actionable steps toward recovery and potential growth. Business owners unable to emerge as leaders during this turbulent time may ultimately find operations impossible to sustain, grow their business, or adapt to the new business environment.

Additional research on women-owned small businesses may uncover how significant and impactful COVID-19 was in female enterprises and what strategies they used to overcome and sustain their businesses during the pandemic. Preliminary studies suggest that the resulting economic crisis is disproportionately affecting women entrepreneurs (Manolova et al. 2020). The largest proportion of female business sectors rely on direct customer services. The 2020 mandated closures significantly impacted travel and leisure, retail, hospitality, food services, and personal care services such as salons. Women business owners express more vulnerability and a more significant impact from COVID-related closures and shutdowns.

Women have historically attested to the difficulty of being recognized as leaders in both the public and private sectors despite qualifications and accomplishments. Even when they are actively serving in leadership roles, female firm owners still receive challenges to their leadership. Yet, women are moving beyond those obstacles and discovering new leadership roles through entrepreneurship. Female entrepreneurs are learning to lead by acquiring knowledge, developing a leadership identity, and emerging as leaders that serve their clients, communities, and network (Higgins and Aspinall 2011).

This chapter adds to the literature by exploring constructive processes and behaviors used by female small enterprise leaders to develop their leadership skills and overcome challenges in their environment. The findings offer women small business owners a better understanding of the types of social networks and behaviors within small business communities of practice positively impacting their entrepreneurial leadership development. Furthermore, capturing and categorizing female entrepreneurial behaviors allow women small business owners (WSBO) to explore strategies and *create* plans to build relationships to support operational and professional development. This chapter is limited to (a) the business aspects of female small business enterprises and their social networks and (b) the social networking behaviors and strategies utilized to overcome business challenges. Experienced female entrepreneurial leaders have found creating and socially constructed supportive networks are crucial to sustaining operations during economic downturn. Network relationships and informal connections often provide access to information and resources. Future research studies may explore how valuable a small business owner's network was in helping them cope with the pandemic crisis and other critical events of 2020.

## Small Business Environments

Entrepreneurs remain vital to supporting and expanding the global marketplace. According to a 2017 GEM report, more than two-thirds of the adult population across 62 economies believe entrepreneurs are well-regarded and enjoy high status within their societies (Herrington and Kew 2017). Entrepreneurs are regarded as individuals who seize opportunities, identify gaps, and create new markets that can disrupt the current state of business (Cogliser and Brigham 2004; Stuart and Sorenson 2005). The landscape of small business ownership is continually evolving and expanding the possibilities for new operations and improved services.

In the last decade, women small business owners around the globe have seen improvements in male and female self-employment rates (Organisation of Economic Co-operation and Development [OECD] 2016). Small business ownership is proving to be a means for addressing gender inequalities. Women-owned small businesses (WOSB) became the fastest growing demographic of business ownership; however, minority, women-owned small businesses (MWOSB) still lag behind nonminority women. Significant differences remain between gender and race for income generation along with access to crucial business components such as capital, resources, networks, and influence. Although female business ownership has increased four times that of their male counterpart from 2007 to 2012, minority and female firms have not experienced significant increases in revenue (NWBC 2016a; OECD 2016). Yet, women persist and continue to see business ownership as an opportunity for creative change, economic empowerment, and personal fulfillment. New programming is needed to address the imbalance and provide tools for women to overcome systemic barriers and unforeseen challenges to advance female entrepreneurial financial and professional ambition and goals.

The life of an entrepreneur can be all-consuming in the early or nascent stages of business development. The nature of small business ownership necessitates a combination of managing uncertainty and an openness to encountering change as part of daily operations. Current literature proposes the maintenance, and growth of a small business requires two essential tasks: the identification of opportunities and the utilization of resources to act on those opportunities (Stuart and Sorenson 2005). For the pre-start-up or nascent entrepreneur, networks represent the interdependencies typical at the early stage of entrepreneurship: family, friends, colleagues, teams, partners, and community-based organizations. But for novice and mature entrepreneurs, networks add a key dimension to the business. The owner's professional development and network of associates, friends, and family help the owner build relationship to address changes in the environment, respond to manifesting opportunities, and create new shared realities. The Global Entrepreneurs Monitor 2015 report also indicates each stage of the entrepreneurial journey requires resources from the prior step and relies on entrepreneurial capabilities and other relationships to assist firms with transiting to the next phase (Kelley et al. 2015). Experienced small business owners (SBO) with quality, socially connected networks are able to position themselves for the leadership opportunities in an economy going through transformation.

The day-to-day operation of a small business requires flexible and adaptable processes to manage the dynamic nature of today's marketplace (Brett et al. 2012). Under normal economic conditions, entrepreneurs struggle to manage the ambiguity and complexity in the marketplace and find it difficult to remain sustainable past 3 years or expand their business from a sole proprietor to at least one employee (Higgins and Aspinall 2011; Rae and Carswell 2001). During the COVID-19 pandemic, small business owners quickly learned the importance of flexibility in a small enterprise, and having the ability to pivot operations meant the life or death of a business. Business scholars offer larger organizations a variety of tools to use in the change process that may take a considerable amount of time to implement and become effective. Small business operations run at accelerated rates of change compared to larger organizations, and many of the

traditional change processes do not translate in small business environments.

## Entrepreneurial Learning

The entrepreneurial learning process is inherently contextual and shaped by various leadership enactments and observations present in their business environment. The term entrepreneurial learning means learning to recognize and act on opportunities and interacting socially to initiate, organize, and manage ventures. Making sense of the changing small business environment requires owners to explore and seek new meaning through uncertain and complex periods. Entrepreneurial learning becomes a continuous process of sensemaking to analyze the new and changing reality and requires action, contribution, negotiation, and change from an internal and external perspective. Socially constructed networks built on trust, autonomy, confidentiality, and strong relationships allow for honest and progressive discussion, feedback, as well as assistance on issues and managing the complexities in the small business environment (Brett et al. 2012).

The lifecycle of a small business encompasses the lived experiences of entrepreneurship inclusive of the cognitive processes and social constructivist behaviors demonstrated in the many stages of small business development, maintenance, and growth. The entrepreneurial development stages in the chapter are adopted from the four stages of business in entrepreneurship: pre-start-up, nascent, novice, and mature (Rae and Carswell 2001). Entrepreneurial thinking, behaviors, and actions are all part of the entrepreneur's experience and are represented differently at each stage. The early stage forces the entrepreneurs to learn through experiential learning, experimentation, observations, and reflective practices.

Entrepreneurial learning at the novice and mature stages requires critical incident management and social constructivism to address higher levels of participation, leadership, financing, resources, and collaboration. Female small business owners may stay in the novice stage for an extended period or even close the business without the necessary connections to find resources to assist them with overcoming business challenges, personal barriers, and societal stereotypes. Creating and socially constructing supportive yet challenging environments become crucial for female small business owners. Despite these and other environmental challenges, women are finding positive networking strategies to create and maintain ventures.

Continuous learning is a crucial and integral part of entrepreneurial social and behavioral activities. Researchers have only begun to take a closer look at entrepreneurial learning and behaviors of novice and mature small business ventures in the last few decades. Several conceptual models are available to describe not only entrepreneurs but the environments in which they operate (Cope 2005; Rae and Carswell 2001). Recent studies have begun to examine internal and external small business processes and strategies that promote or inhibit personal and organizational learning. When entrepreneurial learning strategies are placed in the context of social constructivism and action learning, small business owner will discover behavioral and social activities align with both entrepreneurship and adult-learning theories (Brett et al. 2012; Rae and Carswell 2001).

The professional development needs of small business owners are diverse and complex. Traditional forms of large organizational development and leadership development practices do not address the localized or specific needs of small business owners (Gibb 1997; Mendenhall et al. 2013). Scholars from various traditions understand that entrepreneurial learning is experiential in nature (Cope 2005; Rae and Carswell 2001). Educators are beginning to examine the leadership experiences of small business owners and to understand how to develop learning models that afford small business owner meaningful learning experiences at every stage of the entrepreneur's journey, additionally, expanding on the need to recognize the creation of new opportunities at every stage with the goal of moving the owner forward to their next level.

**Social Constructivism.** Social constructivism provides an educational methodology for

entrepreneurs to understand the contextual nature of shared experiences and entrepreneurial behaviors. In inherently complex entrepreneurial environments, social constructivism allows entrepreneurs a framework (1) to uncover opportunities, create and build new methods of support, and form new leadership perspectives as part of their leadership strategy; (2) to discover processes and behaviors other female small businesses owners opt for in learning to lead; and (3) to engage with others within their communities of practice and business circles (Aubrey and Riley 2016; Brett et al. 2012; Lave and Wenger 2003; Rae and Carswell 2001). Social construction thus supports the entrepreneur's journey through their emergence into leadership and their individual leadership identity and recognized role in their community of practice.

Entrepreneurs observe behaviors and take actions to categorize past and current best practices within their social network as a major part of their entrepreneurial learning (Cope and Watts 2000; Rae 2004, 2005). If small businesses are to be successful, small business leaders must be able to construct learning experiences that are relevant and meaningful (Brett et al. 2012), relevance found through engagement and identifying and exhibiting leadership through increasing social influence within their network to be perceived as leader within your community of practice.

Open communications and interaction with personally developed and trusted networks are one of the preferred learning styles of small business owners (Gibb 2009; Brett et al. 2012). Informal learning provides a means for owners to improve their ability to learn (Higgins and Aspinall 2011; Rae and Carswell 2001). The act of experimentation as a reliable methodology and means toward learning includes practice, inquiry, and reflective thinking to understand and define experiences, in which owners are active participants (Brett et al. 2012; Higgins and Aspinall 2011).

## Entrepreneurial Leadership

Leadership development warrants taking a multidimensional, systemic perspective of the whole environment to integrate all aspects of an organization, including the owner's personal network. Leadership is a continuous process of adjustments to match the complexity involved in entrepreneurial operations (Aubrey and Riley 2016; Brett et al. 2012; Rae and Carswell 2001). Entrepreneurial leadership requires knowledge and skills to think more global, be technically literate, and understand the culture and social norms to stay competitive. Many leadership styles are needed to manage the multiple aspects of people, roles, and time. If the small business owner does not have an environment that affords them the time to explore options, make critical decisions, and practice behaviors, they may find it difficult to cognitively and behaviorally transition into a leadership role to exploit new opportunities or grow their business.

Entrepreneurial leadership is necessary to construct networks that can provide influential leadership and informal social relationships to augment existing network connections, family, partnership and co-founders, and clients to assist with introductions, advice, leadership opportunities, and resources. Building these relationships may enhance leadership behavior, leadership identity, and social influence and create increasing value to leadership over time. As women begin to grow their businesses, social networks may help female business owners hone their leadership skills and expand their realm of influence as network connections turn into trusted, influential relationships over time.

Critical to the entrepreneurial leadership development process is socializing with fellow entrepreneurs and practitioners who have successfully transitioned into socially identified leadership roles. Access to people with knowledge and experiences and encouragement provides value on the leadership development journey. Women small business owners suggest impactful networks provide (1) client referrals, (2) opportunities to collaborate, (3) opportunities for learning, and (4) info on new opportunities (Andrews 2020). Female entrepreneurs also suggest participation in impactful social networks the owner with access to knowledge and information that helped to grow their businesses and establish

relationships and connections. Furthermore, women small business owners identified being part of a social network was necessary to stay connected and informed about issues impacting their business and their industry. During the various stages of the lifecycle of the female small business owner's journey, network connections helped to educate these women on how to maintain and grow their ventures into maturity (Kelley et al. 2015, Rae and Carswell 2001). Their social networks contributed to the sustainability and growth by providing avenues for information flow and exchange, which is vital to the entrepreneurial growth process (Stuart and Sorenson 2005).

**Social Networks**. Social networking in a broader context is aligned with connections and relationships (Prell 2012; Scott 2012; Scott and Carrington 2014). Entrepreneurial networks provide a spectrum of choices for business strategies to incorporate social media, face-to-face interactions, email communication, and virtual experiences, discovering new communities of practice. Each stage of the entrepreneurial journey requires resources and support. Early-stage entrepreneurs may receive support from a familial network to address initial start-up questions and issues, but as a firm evolves, these networks give way to communities and practices to assist with more complexity and greater ambiguity as the business expands and matures (Stuart and Sorenson 2005).

The various conceptual models defining social networking (Aubrey and Riley 2016; Brett et al. 2012; White et al. 2016) provides some insight into positive strategies female small business owners are incorporating. Women are more likely to have a family member, friend, or acquaintances as advisors and may be limited by the entrepreneurial experience in their network (NWBC 2016a). By questioning network types and choices, outcomes from participation in those connections become a tool of measurement on value. Networking begins to add significant value when women learn from experiences in both informal and formal social situations. By expanding their social network, women small business owners learn to nurture new and existing relationships and share in the ideas and purposes of the larger community (NWBC 2016b; White et al. 2016). Additionally, social capital is generated through experiences allowing women to build strong connections that create networks with atmospheres of trust and confidence, affording females the opportunity to emerge as leaders (White et al. 2016).

Social networks play a significant part in entrepreneurial activities through information on new opportunities, resources availability, perceived power, social influence, and referrals to financial capital (NWBC 2016b; Stuart and Sorenson 2005). Entrepreneurs in operations for more than 3 years continue to strive to generate leads and to seek out the most beneficial relationships, regardless of gender, to meet their current and future business goals (Stuart and Sorenson 2005; White et al. 2016). Small business environments continuously evolve, and key components to business sustainability are social networks and access to resources.

Connections often provide access to information and resources that larger firms hire consultants to find and in less time. Various types of information and capital flow through strong and weak connections (Stuart and Sorenson 2005) and social networks contribute to the entrepreneurial processes through strategic relationships. Effective entrepreneurial leaders understand how to leverage and alter social network connections to create transformative possibilities through shared and learned experiences. Very few small businesses operate successfully without using networks to support leadership development in addition to growing their operations.

Established and experienced female entrepreneurs state that their social networks also had a significant impact on their self-efficacy and overall business success and were necessary to stay connected to industry and information that may impact their business. Women small business owners also participated in social networking to gain access to knowledge and information that helped to grow their businesses and establish relationships and connections that resulted in valuable support through collaborative, partnership, and employee resources (Andrews 2020; White et al. 2016). A strategic analysis of the quantity and

quality of an individual's entrepreneurial community increases the probability of firm success.

Sullivan and Weerawardena (2006) describe networking as two functions. The first step requires small business owners to build their network initially and start with the fundamental concept to grow your network as your business grows. The second step functions to renew and extend the network over time to achieve the business vision and purpose. Entrepreneurial growth implies that opportunities are available and discoverable. Social networks provide channels of opportunities and connections, whether strong or weak, serving as bridges into these channels. Socializing with fellow entrepreneurs and other practitioners who have transformed their businesses and identifying themselves as leaders is critical for positive individual and collective change.

**Social Network Analysis.** Social network analysis deconstructs and explores the "who," "what," "why," "how," and "when" of network connections to determine the impact of social networking over time. The social networking construct referenced in this chapter encourages entrepreneurial leaders to analyze their networks and the outcomes from participation in each community. Additional analysis should be undertaken to determine the individual entrepreneur's stage of maturity (Prell 2012; Scott 2012; White et al. 2016). Social network analysis also examines the type of relationships, networks, and the context that leads to outcomes and by looking at patterns of relations (Prell 2012; Scott 2012; Scott and Carrington 2014). Mature entrepreneurs rely on their own capabilities and other networked relationships to assist with transitioning the business as well as their own identity and influence to the next phase (Kelley et al. 2015; White et al. 2016).

Deconstructing one's social network is essential to understanding entrepreneurial leadership that includes industry experience, entrepreneurial learning, educational background, and strong and weak ties (Lemoine et al. 2016; Stuart and Sorenson 2005). Social network analysis also examines the structure and patterns apparent in relationships and how those connections influence outcomes (Stuart and Sorenson 2005). Female entrepreneurs do not necessarily need to network more, but network better seeking out the most beneficial relationships, regardless of gender (NWBC 2016b).

Social network analysis applied to women business owners could open up pathways for women to access capital, information, and resources to construct their enterprises strategically and socially (NWBC 2016b; Stuart and Sorenson 2005). Networks providing opportunities for collective and shared leadership roles can help female entrepreneurs transition through the start-up period to the growth period by assisting them to recognize and act upon business and leadership opportunities. Social network deconstruction aids in understanding the benefits of a connection, such as an opportuntiy to engage, to define best use of time and resources, and to assess conditions for leaderhsip opportunities should be part of the social networking and leadership strategy.

## Emerging Female Entrepreneurial Leaders

In a recent study, women small business owners agreed that having a leadership role in a network gave them greater influence and added increasing value to their leadership over time. Additional correlations contained values with strong positive linear relationships between observing other entrepreneurial leaders and developing entrepreneurial leadership skills which delivered an $r$ score of 0.678 (Andrews 2020). As leaders within their socially constructed networks, female business owners are creating new leadership pathways through entrepreneurial learning and learning to lead by developing a leadership identity and actionable leadership behaviors (Higgins and Aspinall 2011). Female small business owners have gained an awareness that leadership development strategies and practices are important aspects of networks characteristics.

Kolb's theory for experiential learning aids in the identification of strategies shared by owners at various stages in the small business life cycle. Experiential learning as defined by Kolb evaluates

learning through four categories: concrete experiences, reflective experiences, abstract conceptualization, and active experimentation. Entrepreneurial learning incorporates these experiences under slightly different terms: experiential learning, reflection, critical incident management, and social constructivism. As adult learners, small business owners appreciate that learning is social in nature, includes first-hand experiences, and requires participation and engagement, and also them to construct networks with new opportunities to explore. Table 1 stages an interpretive view of entrepreneurial learning based on Kolb's theory and is aligned with the individual quantitative survey questions and qualitative responses on female small business leadership. The leadership development strategies provide a model or template for women small business owners to utilize when assessing their strategy for leadership development.

Opportunities that combine experiential learning and leadership experiences help develop transferable skills for entrepreneurs to emerge as leaders (Cope 2005; Rae and Carswell 2001). Engagement and participation contribute to the formation of new mental models to help entrepreneurs garner new tools to identify and construct new opportunities (Andrews 2020). Social networks provide learning environments for female business owners to connect their business goals with their professional development goals by affording them lived experiences and connections to form new relationships and collectively shape their environments. Entrepreneurial learning occurs collaboratively with others, and as emerging entrepreneurial leaders, they have greater social influence to contribute their leadership to local and global communities. Believing you are a leader can have a positive effect on leadership identity and leadership behaviors, and for entrepreneurs, beliefs become transformational.

Entrepreneurship and leadership are fundamentally socially constructed behaviors operating by bringing together information, people, and technology to fill a need or create new and innovative solutions. Mature female entrepreneurs understand the complexity of managing ambiguity, networking effectively, making daily decisions, and providing leadership development for themself and their team. A key leadership development service that social networks offer women small business owners is an environment where they can hone their leadership skills and begin to identify themselves as influential leaders. Female entrepreneurs are changing the traditional ideas around leadership development by removing the large corporate view of leadership and embracing entrepreneurial leadership, leadership

**Emerging Female Entrepreneurial Leaders, Table 1** Entrepreneurial learning aligned with leadership development strategies

| Entrepreneurial learning | Self-assessment questions | Leadership development practices |
|---|---|---|
| Experiential learning | I have a leadership role in my social network | Getting involved and sharing<br>Presenting at conferences/ events |
| Reflective practices | My network provides me with opportunities to observe entrepreneurial leadership behaviors | Observing, meeting others who have done it<br>Accepting feedback<br>Finding a mentor/seeking out others<br>Balancing time and networking |
| Critical incident management | My network helps me develop entrepreneurial leadership skills | Reading, YouTube<br>Attending conferences/events<br>Finding true cohesive relationships |
| Social constructivism | I consider myself an entrepreneurial leader | Expanding into new channels<br>Participating/leading and become the face of the business |

continuously managing complexity and ambiguity in today's increasingly dynamic marketplace. Novice and mature entrepreneurs were surveyed to ascertain the biggest benefit their social network provided to their leadership development, and the benefit of "honing my skills" was over three times more prevalent than any other type of networking benefit (Andrews 2020).

Women business owners are stepping forward into leadership roles and honing their leadership identity and leadership behaviors through strong and weak connections within their own network. They are also serving as bridge and resources to additional information, people, and resources. The growing number of female business owners are altering the marketplace by harnessing their collective leadership to support local communities and leading enterprises actively supporting another emerging, novice, and mature female entrepreneurs. Women business owners employed social networks to hone their leadership skills. Established female entrepreneurs already fully recognize their leadership identity, model leadership behaviors to advance their leadership capabilities, and emerge with influence and resources to contribute and collaborate with other business and community leaders (Andrews 2020).

Women-owned small businesses already have a leadership mindset, with 73% of the female business owners' survey responses showing strongly agree (42%) to somewhat agreement (29%) with the entrepreneurial leadership role. Andrews (2020) conducted interviews to corroborate the leadership mindset of female small business owners, with 81.5% positively affirming their role as an entrepreneurial leader. Female entrepreneurial leaders are networking to maintain or develop trusted relationships, hone their leadership skills, gain champions to help market, and create visibility and branding for their company. Many of the women were already serving in their communities as part of the collective leadership, not as a strategy but as personal connections or affiliation to organizations they aligned with, such as youth groups, educational programs, and larger nonprofit advocacy organizations. Established small business owners chose to direct their leadership toward their communities through service-oriented or nonprofit programming aligned to their own interests, thus expanding their level of social influence and collective leadership in these communities while working to improve others' lives.

Informal networks serve as safe spaces and as bridges for professional development and contribute to business growth through individual participation and engagement (Aubrey and Riley 2016; Lave and Wenger 2003). Educational programming for female entrepreneurs should utilize a social constructivist framework to social networking and entrepreneurial learning concepts into their curriculum. Leadership education for female entrepreneurs should also encourage global partnerships, member collaborations, and shared leadership opportunities resulting in expanding the possibility for women entrepreneurial leaders. As more and more minority women small business owners emerge contributing to economic growth in their communities, higher levels of participation and engagement from all women become possible and may lead to women and minorities in leadership as the norm (Lemoine et al. 2016).

With over 90% of the businesses categorized as microenterprises in the United States, guidance, focused education, and empirical research are needed to help these businesses grow and create jobs to expand the economy. The first step for female business owners to grow their business should be to effectively assess their network and connections for opportunities and resources. Microenterprises should feel empowered in understanding how their relationships positively contribute to their business, their professional growth, and their financial returns. Female microenterprise owners should look for and examine leadership roles in their community of practice and learn to collectively hone their skills by partnering with other microenterprises and leverage their individual networks to pursue new opportunities and new ways to collaborate.

Experienced microenterprise owners are referring and leveraging each owner's connections to achieve greater access to information. They are seeking out new opportunities, opportunities to learn, opportunities to collaborate, and

opportunities to connect with new markets for potential clients. Female firm owners are encouraged to analyzing group members, tasks, and outcomes to make sense of the criteria used to establish leadership. Since leadership tends to have influence, women business owners should seek the opportunity to lead if possible. White et al. (2016) hypothesize that advice-giving can have a positive correlation to leadership emergence and leadership influence. They conclude that informal instrumental networks give advice that enables individuals to share and reach out with potential resources. Social networks creating opportunities and offering these types of support services are invaluable to women small business owners. One female small business owner shared the practice of assessing your network annually to determine whether opportunities to lead were available or whether your active participation contributes to the group's vision and influence. If these criteria were not met within a specified timeframe, the recommendation was to seek another open and collaborative channels and connections.

Building stronger relationships over time could yield circumstances offering new collaborations. A collective group network analysis affords the group the ability to leverage all known connections for opportunities to learn from other small business owners, create new strategies, and respond to larger opportunities by combining resources and capabilities. Female microenterprises could begin to see how to collectively lead and emerge as leaders with more power and influence in the two merged networks. Individual entrepreneurial leadership combined with other entrepreneurial leaders can collectively shape, influence, and create positive change in the newly constructed community of practice.

## Conclusion

This chapter offers some guidance into the networking behaviors and practices of female enterprises in regard to emerging leadership. The assessment of network connections can empower microenterprises to move along the path of becoming entrepreneurial leaders. Female microenterprises are leveraging their individual network connections to achieve greater access to information by analyzing from which community information, learning, and opportunities stem. Highly interactive and diverse networks afford women the ability to emerge as leaders and gain more and more social capital (Lemoine et al. 2016).

Emerging as a leader requires participation in social groups, patterns of interactions, and the establishment of expected community behaviors. Leadership is considered to emerge when followers construct their experiences as having a leadership-followership dimension. As the social context of female leadership becomes more prevalent in the global marketplace, new group norms develop to allow for open collaboration, and equal access to new opportunities (Lemoine et al. 2016). The expansion of social networking and leadership development programming for women small business owners would allow female entrepreneurial leaders to model leadership behaviors in formal and informal networks regardless of gender, ethnicity, or socioeconomic status. Over time this positive change and the growth of female enterprises will significantly impact the awareness, practice, and education of female small business leaders to transform them into powerful and influential leaders globally. Confidence in your growth and development as a leader with your network leads to confidence in your business as you represent your company. These emerging female entrepreneurial leaders can define entrepreneurial leadership in new and unique ways as women begin to discover their own leadership, extract the value out of their network, mentor other female owners, and contribute back to their communities with more knowledge, power, and collective influence as future female entrepreneurial leaders.

# Emerging Infectious Diseases and Emergency Management

Bruce Binder
Global Vision Consortium, Inc., Rochester, WA, USA

## Synonyms

Disease outbreak; Pandemic management; Public heath emergencies

## Definition

Role of emergency management in responding to new and novel illnesses that impact populations.

## Introduction

Infectious diseases occur in populations everyday. People get sick and usually, with rest and care, get better. Increasingly, there are "new or reemerging infectious diseases" appearing that have high morbidity and mortality rates.

- What are the causes of these diseases?
- What world conditions have led to new outbreaks or the resurgence of outbreaks?
- What is changing in healthcare that makes these outbreaks more deadly?
- If disease control is the job of the health community, what is the relationship to infectious diseases in the context of emergency management?

Both bacteria and viruses are simple organisms. Like all life they live, require food, reproduce, sense their surroundings, and interact with other life forms. The life of a single bacterium or virus is measured in hours to days. They reproduce rapidly, producing numerous generations within days or weeks. This rapid life cycle encourages mutations that allows them to adapt to changing conditions.

Historically, isolation provided by large geographic distances provided a physical barrier to transmission of these organisms to new populations. Bacteria and viruses live and survive in all parts of the world. Populations that live in a particular region gain immunity to the effects of these local bacteria and viruses. Human immune systems recognize are able to combat the invading bacteria to virus, which allows people to only have a mild illness. When enough people in the community develop this "herd" immunity, it becomes hard for the bacteria or virus to infect enough new hosts to sustain the community outbreak, and the outbreak dies off.

**The Zika virus as a recent example**: A current example of an emerging infectious disease is the Zika virus. Zika was first identified in 1947 in Uganda where it identified in mosquitos. The World Health Organization (WHO) first identified Zika in humans in 1952. At that time Zika was restricted to Uganda and the United Republic of Tanzania. By the early 1980s limited outbreaks have been reported in the warm latitudes throughout the world. In 2007, the first large outbreak of Zika occurred on the island of Yap, the Federation of Micronesia. In 2015 clinicians were seeing an association between the Zika virus and Guillain Barre Syndrome. By late 2015 Brazilian public health officials reported an association between mothers who had been exposed to Zika while pregnancy and microcephaly. Since then, the Zika virus has been identified in the warmer climates. (WHO Zika Fact Sheet, Sept 2016) Most recent outbreaks include Papua New Guinea (2016), Peru (2016) Chile (2016) and Saint Lucia (2016) and Southern and Southwest United States (2016). In the first three months of 2017 outbreaks have been reported in the United State, Mexico, CuraÃ§ao, Trinidad and Tobago. Zika is still emerging and evolving. It is an example of an emerging infectious disease that relies on interspecies jump, Hygiene (standing water) and travel to expand. Since Zika is a virus, use or overuse of antibiotics has played no role in this emerging disease. Overall, the global risk assessment has not changed. ZIKV continues to spread geographically to areas where competent vectors are present. Although a decline in cases of Zika virus

infection has been reported in some countries, or in some parts of countries, vigilance needs to remain high. (WHO Zika Situation Report March 2017). Control of this disease is an example of public health and emergency management professionals working together throughout the world to reduce the impact of this disease.

Emerging or reemerging infectious diseases emerge as community illnesses because they enter the community through one or more ways.

**Interspecies jump**: One of the most common examples of interspecies jump is the transfer of new (to humans) flu viruses from animals. For example, medical personnel label the two major flu variants as "swine" or "avian," meaning that they originated in pigs or birds. Swine and most birds live with viruses that do not make them ill. For the virus to impact people, two things must be true. First, the virus must mutate in a way that, when exposed to humans, the human immunity system does not recognize it as new and mobilize the natural defenses against this new strain. Second, humans must be in close contact with the birds or swine to allow for the jump of the virus from one species to another. New variants of human flus commonly emerge from parts of Asia when farmers live close to their livestock. Another recent example is Ebola, which emerged in the human populations in Western Africa in 2013. Long known to affect primates and bats in the area, it had not been a danger to humans. Case Zero has been described as a young child who may have been exposed to a fruit bat that had the disease. Once in the human population, it easily spread from human to human, as these populations had no immunity to the virus.

**Travel**: Travel has long been a major contributor to the emergence or reemergence of infectious diseases. Three classic examples help demonstrate the link and why emerging infectious diseases require the partnership of other public health managers and emergency managers.

As early as 1340, the bubonic plague ravaged China, India, Persia, Syria, and Egypt. The numbers of humans killed by *Yersinia pestis*, the Black Death, in these communities are not well documented. Historians note that this pattern is consistent with the disease moving with trade on the major east-west trading routes. *Yersinia pestis* arrived in Messina, Italy, in1347 when 12 Genoese trading ships arrived from the Black Sea. During 1346–1353 the bubonic plague killed 60% of the population in Europe. Estimates are that as many as 75 million died in this infectious disease outbreak.

A more modern example of how travel interacts with emerging infectious disease is the outbreak of HIV and AIDS. It is widely believed to be the result of an interaction with a chimpanzee and a human in the Democratic Republic of the Congo, Africa, in the 1920s. Sporadic cases were reported until the late 1970s when, with the aid of modern air travel, cases were identified in North America, South America, Europe, Australia, and Africa. It is strongly believed that without modern air travel, HIV and AIDS would have taken significantly longer to become endemic throughout the world.

Finally, there is a classic example that combines all three of the elements that are embedded in the first two examples: The 1918 worldwide pandemic flu (H1N1). It was first identified at Fort Riley, Kansas, among new army recruits preparing to go overseas as part of World War I. There is evidence that it originated in China and traveled to the United States with the 96,000 Chinese laborers imported to the United States to prepare for the US participation in the war. It spread throughout the world, first by service personnel and then by people who had contact with these people. In the end, this variant of the H1N1 virus killed up to 50 million people before it ran its course.

**Poor hygiene**: Most infectious diseases can be spread either directly or indirectly by poor hygiene and handwashing. Bacterial or virus infections are spread by poor hygiene and therefore limited by good hygiene. This vector for spreading infectious disease remains one of the most common methods. Infectious disease specialists will tell you to follow the advice of your mother:

1. Wash your hands.
2. Cover your mouth when coughing.

3. Stay away from someone who is sick, or, if you cannot do that, wear appropriate personal protective gear to provide a barrier between you and the person who is ill.

**Overuse of current antibiotics**: The development of antibiotics began in the 1930s with the use of sulfa drugs. In the 1940s penicillin was discovered. Drugs classified as antibiotics are clinical killers of bacteria. Unfortunately, bacteria have adapted and continue to adapt. In the 1940s a standard effective dose of penicillin was 20,000 units. Today, effective doses are measured in the millions of units and even that dose may not be effective, as bacteria are rapidly mutating to become resistant to the antibiotics. The ability to create new drugs that can kill the bacterial infection continues. Scientists have created four generations of antibiotics. Each generation of antibiotics works for a while until the bacteria adapt. In 2017 there is indication that some bacteria are beginning to be resistant to the latest generation of drugs. This race between bacteria becoming resistant to antibiotics and the ability to find new antibiotics continues. If the mutating bacteria win this struggle, by 2050, up to 50 million people will die of illnesses that today are cured by antibiotics.

## Connection of Emerging and Reemerging Infectious Diseases to Emergency Management

Infectious diseases are endemic in human populations. Improvements in public health, sanitation, and medical care have transformed what used to be an unbridled major killer of people into manageable outbreaks, most of the time. Beginning in the late 1800s and with rapid advances in the 1900s, the role of fighting infectious diseases has been turned over to the public health and medical communities. Several things have changed. Outbreaks of infectious diseases range from an inconvenience to threatening the life of the community.

Responding to a major outbreak requires more resources than most public health organizations can mobilize. An effective response requires a coordinated effort beyond the public health and medical communities, including case finding, setup, and operation of vaccination or pharmaceutical distribution centers, and operating treatment centers, ensuring that identified populations remain quarantined in their homes, and other emergency response activities might be identified. An emergency management response effort refers to all the coordinated governmental and non-governmental efforts that work together during a natural or man-made emergency. Emergency managers are good at coordinating diverse groups that may or may not work together on a daily bases. They know how to rapidity facilitate groups working together and minimize duplication and wide gaps in assistance.

Using Incident Command System (ICS) and Unified Command (UC) structures is essential to manage a major infectious disease outbreak. While smaller outbreaks can be managed through a single Public Health Departmental Operations Center (PH DOC), an emergency operations center (EOC) or multiple agency center (MAC) brings together more organizations and resources. In either case a physical location, where intelligence can be coordinated, strategies and resources can be coordinated, and a single coordinated message can be developed and agreed to by all, is essential to ensure ensuring that the different organizations that interact with the public during this public health emergency speak with one voice and provides a well coordinated response. The Unified Command needs to include all of the senior decision makers such as members of public health, emergency medical services, fire, law enforcement, and the emergency manager. Other groups represented in the Unified Command may include specific non-governmental organizations (NGOs) and other organizations deemed critical to decision-making and resources. Other organizations should fit well within the command and staff structure of ICS.

## What Types of Strategies Need to be Coordinated?

**Information collection**: Key to any successful response is to know what has happened, what is

happening, and what is likely to happen. While knowing that the exact infectious disease is critical, there are strategies that can be employed despite not knowing. Many organizations may have a piece of the puzzle. Bringing them together to share information and feel part of the team is a critical first step.

**Containment**: Containment of an emerging infectious disease occurs when you can isolate those exposed and those who closely interact with them away from those not exposed. However, the resources to do this can be beyond the resources of even the largest public health organization. One of the strategies employed in communities within the United States during the 1918 Flu Pandemic was self-isolation. Public health officials would ask people with family members who had the flu to stay in their homes until all were well. This was done voluntarily and did not need law enforcement to ensure compliance. It is doubtful that there would be high voluntary compliance today. One of the major tools used to stop the spread of Ebola was quarantining households and villages. Public health officials needed the community emergency management network and organization to accomplish this.

**Communications with the populations**: Most people will work with governmental agencies when provided understandable information, reasonable direction, and they feel safe. The larger the outbreak, the more likely some people will not willingly follow public health-provided direction. Developing a single coordinated message on what has happened, what is happening, what is being planned, and what people should do and not do is important. Unclear messages or messages that suggest different actions only lead to frustration, chaos, and noncompliance by the public. Bringing together communicators from different responding organizations to craft and deliver a message that the public can understand and follow is a major key to successful public support of the actions necessary to respond to a major outbreak.

**Coordinated plans for providing relief and medical care**: Using the intelligence developed, clinical expertise, and available resources, a plan can be developed to identify people who have been exposed, care for those who need care, isolate those who have been exposed, and provide for the needs of both. Emergency managers have the tools to be part of and support the organized response to a major outbreak.

## Conclusion

Public health agencies throughout the world are on the lookout for emerging and reemerging infectious diseases. When communities experience a major infectious disease outbreak, the combined efforts of the public health and medical and emergency management communities are necessary to contain the illness and treat those impacted. When faced with a large community-wide disaster, many members of the emergency management team will need to support the community effort, and the organization developed for other disasters will be useful in meeting the needs of the public.

# Emerging Use of User-Generated Ratings to Supplement Healthcare Quality Reports

Edward Alan Miller, Jennifer Gaudet Hefele and Pamela Nadash

## Synonyms

Consumer assessment; Online reviews; Public reports; Social media; Social networking

## The Rise of Social Media

Increasingly, people who use healthcare see themselves as consumers in a healthcare market. As such, they expect to have access to meaningful information that enables them to make choices among healthcare providers; they also expect to have a public forum for airing grievances or sharing positive experiences. Everyday use of websites such as Amazon or Yelp has made it routine for consumers to incorporate user-generated data (that is, online ratings and reviews) into their decision-making process and to report on their purchases. Why, then, should this trend exclude healthcare services and providers? This section examines the emergence of user-generated information on social media in the healthcare context.

Social media is where communities of people gather online to generate, share, receive, and comment on information, knowledge, and opinions (Moorhead et al. 2013). The term "social media" is broad: it includes social networking sites such as Facebook and LinkedIn; blogging platforms such as Wordpress, microblogs such as Twitter; picture- and video-sharing websites such as Instagram and YouTube; and online review sites such as Yelp and TripAdvisor. Today, approximately two-thirds (69%) of American adults belong to at least one social networking site, up from just 5% in 2005 (Pew Research Center 2017).

All kinds of for-profit, non-profit, and government organizations are active in social media (Barnes et al. 2015; Barnes 2014; Smith 2016). Although healthcare has been comparatively slow to adopt social media, it is catching up. In 2014, most US hospitals had a Facebook page (94.1%) and Yelp page (99.1%) and about half (50.8%) a Twitter account (Griffis et al. 2014). Healthcare professionals are using social media more, as well. A 2011 study, for example, found 87% of 4000 physicians surveyed used social media for professional reasons (Modahl et al. 2011). This growth has prompted provider associations – such as the American Hospital Association, American Medical Association, and American Nurses Association – to develop guidelines outlining professional and ethical standards for using social media responsibly, along with major healthcare organizations such as the Mayo Clinic.

The public has increasingly turned to the web for health-related information and support. About two thirds of US adults (59%) and three-quarters of adult internet users (72%) report searching for health information on the internet, most frequently concerning particular diseases and treatments (Fox 2013a). Online activities include finding others with similar health concerns,

reading or watching commentary about health or medical issues, posting and answering health-related questions, and communicating with other consumers or providers. It also includes reading and contributing their own experiences and opinions as healthcare patients and consumers.

## User-Generated Ratings and Reviews and Social Media

Social media has become progressively more important when people shop. While in 2004 only 25% of internet users reviewed or rated a product, service, or person online (Hitlin and Rainie 2004), by 2016, more than half of all Americans posted online ratings or reviews of products (61%), services (60%), or restaurants (51%) (Smith and Anderson 2016). Most Americans (82%) rely on customer ratings or reviews when shopping, including 40% who "always or almost always" read this information when buying an item for the first time. At 66%, consumer opinions posted online was the third most trusted source of product review among potential consumers globally, behind family and friends (83%) and brand-managed websites (70%) (Nielsen 2016).

Although less common than in other sectors of the economy (Hanauer et al. 2014), user-generated ratings and reviews are increasingly being consulted in healthcare. One survey found that, in 2012, 17%, 14%, and 18% of adult internet users consulted online rankings or reviews of doctors/other providers, hospitals/medical facilities, and drugs/medical treatments, respectively (Fox 2013c). Few adult internet users, however, posted a review online about healthcare providers or products (3–4%), although caregivers and people with chronic conditions were more likely to do so than other internet users (Fox 2013a, b). Other studies suggest 25–59% of patients had visited physician-rating websites while 5–11% had posted ratings and/or reviews (Hanauer et al. 2014; Trehan and Daluiski 2016).

The emergence of user-generated content is consistent with the industry-wide focus on person-centered care, which "sees the people using health and social services as equal partners in planning, developing, and monitoring care to make sure it meets their needs" (Health Innovation Network n.d.). Social media websites that permit people to rate and review the quality, safety, and acceptability of healthcare providers perform a useful function in centralizing and aggregating the perspectives of large numbers of individuals. Moreover, they expand the scope of information available to inform patient decisions (Rozenblum and Bates 2013) beyond the traditional parameters informing choice: geographic location, word-of-mouth (family, friends), their own experience, provider reputation, and physician referral.

## The Range of User-Generated Rating and Review Websites

Many types of websites report consumer ratings and reviews in the health sector. Some, such as Yelp and AngiesList, include healthcare among many other types of consumer products and services. Others focus specifically on healthcare. Websites such as Vitals, ZocDoc, and RateMDs focus exclusively on physician ratings, whereas websites such as HealthGrades focus on multiple provider types (e.g., physicians, hospitals, dentists). Still other online review platforms are integrated into social network websites (Facebook) and microblogs (Twitter). Some of these only ask patients to rate providers on a simple scale; others also ask for ratings on specific dimensions of the patient experience (e.g., scheduling, office environment, wait times); while yet others allow users to post written comments or reviews. One site, ZocDoc, combines patient reviews and appointment scheduling. Online rating and review websites may be consumer-driven, provider-driven, or third party-driven.

Consumer-driven review websites enable people to rate and share their experiences with other consumers. The paradigmatic example is Yelp, which crowdsources its content from "large groups of anonymous volunteers rather than paid employees" (Luca 2016). Since it was founded in 2004, Yelp's more than 157 million monthly visitors have posted 127 million reviews.

Approximately 6% of Yelp's reviews were health- or medical-related, including a broad range of health professionals and services but most notably hospitals, nursing homes, dialysis clinics, and physicians. Reviewers must register to rate their experiences on a 5-star scale and contribute comments. Users can see the average rating, how it has changed monthly, and the distribution of reviews across 1, 2, 3, 4, and 5 stars. Yelp highlights reviews by specially designated "elite reviewers" – those who submit frequent, well-written reviews. Any business owner or consumer can add a business to Yelp, but they cannot influence the ratings or reviews posted.

Provider-driven review websites enable hospitals, nursing homes, and other providers to receive feedback from consumers. Some providers allow users to leave ratings and reviews on their own websites, including health systems such as the Cleveland Clinic, Piedmont Healthcare, University of Utah Health Care, Duke, and Stanford. To varying degrees, these groups post patient satisfaction survey, open-response comment, and other data online. Other providers encourage consumers to rate them on other websites, such as Facebook, which allows customers to rate the provider – giving them 1–5 stars – and post reviews, which they can share with their friends or the public. Individual ratings are averaged into the provider's overall score, which is visible to the public. Facebook rules constrain posting: reviewers must follow Facebook Community Standards, focus on the product or service, and post only about their personal experience. Page owners (the providers) cannot delete or approve individual ratings and reviews, but can decide to turn on/off the rating and reviews feature; they may also ask Facebook to remove material that violates Community Standards.

Third-party driven websites acquire profile information on providers and allow consumers to leave ratings and reviews. Providers have no control over the ratings and reviews posted. Like Yelp, however, providers can "claim" a profile in order to update their profile information and, like Facebook, providers can request that falsified reviews be removed. Healthgrades, founded in 1998, is among the most widely used provider review websites, containing over three million provider profiles, including 750,000 physicians. The site receives 30 million visitors monthly, 12 million to its physician profiles. Consumers must register and are asked to provide an overall 5-star rating, write a review of their experience, and complete an 8-item questionnaire addressing the office environment, scheduling, staff friendliness, trustworthiness, explanation(s) provided, listens/answers questions, time spent, and wait time. Optional demographic information – gender, age, and number of office visits – can be reported as well. Provider profiles, in turn, display the average overall rating, number of surveys completed, patient reviews, and results for the eight-item questionnaire. They also report basic information such as physician specialties, board certifications, insurances taken, and awards/recognition.

## Contrast with Other Methods of Collecting Patient Experience

Another approach to obtaining patient perspectives is through patient satisfaction and experience surveys, which are increasingly being used to assess the care provided in healthcare organizations. In contrast to the user-generated ratings/reviews discussed previously, such data are collected systemically through carefully designed surveys typically administered at periodic intervals (e.g., annually) to a randomly selected group of patients who received care from a given provider. The rationale for such surveys is consistent with that of user-generated data: they provide important information about users' experiences, enabling people to make a better choice of provider. Results are sometimes posted on publicly available websites that typically offer other data – on clinical quality of care, for example.

All hospitals are required to conduct the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) survey, which collects systematic data on patient experiences with hospital care. The federal government posts results from the HCAHPS alongside clinical information on hospital performance

(e.g., complications, readmissions, and deaths) on Hospital Compare, the federal website providing consumers information on the quality of hospital care, nationally. This is required by some other providers types as well, including home health providers, dialysis centers, and physician group practices. This practice, however, is by no means universal: for example, the federal government's report card for nursing homes, Nursing Home Compare, does not include patient experience data. Although a few states do report such data on their state-based nursing home report cards (six at last count) (Castle et al. 2011), prospective nursing home consumers generally lack information on the experiences and satisfaction levels of current residents.

Consumers find government-sponsored websites such as Hospital Compare and Nursing Home Compare hard to navigate and interpret, lacking information on items important to them, and potentially untrustworthy due to concerns pertaining to the source and accuracy of the data reported (Miller et al. 2017). This is in contrast to widespread familiarity and comfort with social media websites such as Yelp and Facebook and the relative simplicity and comprehensibility of the information posted on those websites. Moreover, no American government- or foundation-sponsored public reporting website permits consumers to leave ratings and reviews. This stands in contrast to the UK National Health Service Choices website, which, since 2007, has allowed consumers to rate and review providers.

User-generated ratings and reviews hold several advantages relative to systematic patient experience surveys such as the HCAHPs. Surveys tend to focus exclusively on patients, are costly to administer, suffer from low response rates, and often have substantial time lags – from several months to several years – between when patients experienced care, when they completed the survey, and when the results are reported. In contrast, patient ratings and testimonials posted online are essentially cost-free to the healthcare system. Social media websites such as Yelp and Facebook enable all patients to share their experiences, not just the limited sample that receives a survey. Family members and friends – not just patients themselves – can also comment on these sites, potentially providing additional useful information (Bardach et al. 2016). Social media websites also allow immediate reporting, thereby eliminating the considerable delays that occur with traditional survey methods. Online ratings and review websites thus make continually updated information on opinions about quality from potentially large number of consumers readily available, both to inform decision making on the part of prospective patients and their families, and to facilitate real-time surveillance and administrative adjustments (Hawkins et al. 2016; Kilaru et al. 2016).

Importantly, user-generated reviews address a broader array of topics pertinent to the patient experience than conventional surveys. Structured questionnaires such as HCAHPS limit patient feedback to predetermined domains, including nursing and physician communication, staff responsiveness, pain control, hospital cleanliness, and discharge information. While reviews on Yelp and other sites also address such domains, they frequently mention others, including out-of-pocket costs, insurance/billing, ancillary testing, amenities, scheduling, compassion, caring, comforting, safety, and particular services (e.g., surgery/procedure, labor/delivery) (Bardach et al. 2016; Ranard et al. 2016). Thus, the ability to comment in their own words on their overall care experiences allows consumers to provide information on important aspects of care not captured by structured survey instruments.

The usefulness of user-generated reviews on consumer choice derives, in part, from the power of narratives in supporting and clarifying decision-making (Lagu et al. 2010; Schlesinger et al. 2015). This power is particularly important when people make complex decisions, such as about healthcare providers or treatments. Narratives help in several ways. First, they increase the emotional accessibility of the information reported. This is, in part, because narratives "introduce a public voice for previously anonymous opinions constrained by surveys" (Kilaru et al. 2016). It is also, because "humans respond to personal stories and recommendations, especially from those who we judge to share common

experiences and concerns" (Greaves et al. 2014b). Moreover, narratives are effective because they add nuance and context not captured by surveys, thereby increasing the meaningfulness and usefulness of the information reported for consumers with varying experiences and decision-making styles (Schlesinger et al. 2015). It also provides actionable insights on patient experiences by detailing the mechanisms enhancing or impeding provider performance. Surveys ratings report on general categories (e.g., communicating poorly with physicians) but offer insufficient detail on why consumers assigned a particular rating, or what, specifically, providers need to do to improve performance. In contrast, patient narratives often identify the specific reasons consumers feel the way that they do (e.g., particular interactions that resulted in perceptions of poor communication) and thus the actions providers need to take to address the issues.

## Concerns About User-Generated Ratings and Reviews

Because people connect and respond strongly to the greater emotional accessibility of narratives, there is concern that the growth in provider review websites may lead consumers to neglect more rigorous quality performance metrics (Schlesinger et al. 2015). This includes patient experience survey instruments like HCAHPs, which were adopted after years of careful design and development, and then fielded and interpreted systematically using a representative sampling frame. The rigor of such instruments contrasts with user-generated ratings and reviews, which develop organically and are largely unstructured and unregulated (Ranard et al. 2016). Unlike systematically administered surveys, it is not possible to know who exactly is providing ratings and comments on provider review websites. Thus, it is often unclear if those reviewing a particular provider are recent patients, or even received care from that provider at all (Schlesinger et al. 2015). That rating and review websites allow anyone to submit a review, say, about a hospital – patient or family member, outpatient or inpatient discharge – complicates interpretation of the information provided compared to conventional surveys, which carefully matches respondents to the survey instruments used (Kilaru et al. 2016).

In addition, individuals posting online ratings and reviews may not be representative of the broader population of patients who received care, potentially biasing the results. This bias may affect both those posting and those receiving reviews. Not all providers use or engage in social media, thereby limiting opportunities for clients to post about their experiences. Extant evidence, for example, indicates that social media usage tends to be higher among larger, urban, private non-profit, teaching hospitals (Griffis et al. 2014; Ranard et al. 2016). It also indicates that non-chain affiliated nursing homes with fewer publicly funded residents located in higher income counties and more competitive markets are more likely to have a Facebook page while for-profit nursing homes are less likely to have one (Hefele et al. 2017).

Not all consumers leave ratings and reviews. Those motivated to post a rating or review may skew toward particular personality traits and technical capabilities with, for example, those who shop online being much more likely to consult online reviews than those who do not (49% vs. 6%) (Smith and Anderson 2016). Posters may also skew toward individuals with certain demographic characteristics: despite growth in social media use among all population segments over the last 15 years, disparities persist (Pew Research Center 2017). In particular, older, less well-educated, African Americans with low incomes living in rural areas are less likely to use social media than younger, better educated, white and Hispanic Americans with higher incomes residing in urban and suburban communities (Pew Research Center 2017). Similarly, those least likely to use health-related online rankings and reviews are the least well-educated and lowest income adult internet users residing in rural areas aged 65 years or older, whereas those most likely to do so are the best educated and highest income users residing in suburban areas aged 30–49 years (Fox 2013a).

Too few contributors and their distribution across the growing number of sites further exacerbate the unrepresentativeness of the posting population (Lagu and Lindenauer 2010). One review found that although the average number of ratings per physician ranges from 0.63 to 3.2 across US-based physician rating and review websites, the distribution of reviews is highly skewed: most physicians were unrated, while those who were rated received many ratings (Emmert et al. 2013). Most hospitals (69%) do not have a Yelp review; of those that do, half (51%) have four or fewer reviews (Ranard et al. 2016). The small number of reviews compromises the reliability and validity of the information reported. When there are few ratings, overly negative or positive assessments can disproportionately impact the overall score, and the entries are less likely to reflect the views or experience of the broader patient population. One solution would be to impose a minimum threshold of contributors, say, 5–10, before reporting the ratings or comments for a particular provider (Greaves et al. 2014b).

Another major concern is the bias in tone that may result when reviews fall at the extreme positive and negative poles. This possibility is reflected in Ranard et al. (2016) analysis of 16,862 Yelp hospital reviews, which revealed a bimodal distribution with 31% and 33% of the rating being one and five stars, respectively. Although some evidence suggests that people posting online about healthcare providers may have more negative views than those posting about other businesses (Ranard et al. 2016), most health-related online assessments skew positive. Kadry et al.'s (2011) analysis of 4999 reviews posted on the 10 most visited physician rating websites found average ratings of 77 out of 100 for sites using a 100-point scale; 3.84 out of 5 (77%) for sites using a 5-point scale; and 3.1 out of 4 (78%) for sites using 4-point scale (Kadry et al. 2011). Similarly, Ellimoottil et al. (2013) analysis of reviews of 500 urologists across 10 physician rating websites found that most (86%) received positive ratings and that the majority of written reviews (53%) were positive, followed by neutral (22%) and negative (25%) assessments. Other studies indicate that 62–88% of comments reported about providers were positive (Black et al. 2009; Lagu et al. 2010; Lagu et al. 2013; Greaves et al. 2014a; Lopez et al. 2012).

Although providers have expressed concerns about the threats posed to their reputations (Menon 2017), most reviews, as noted, are positive, suggesting that, if anything, there may be underrepresentation of negative encounters and experiences among those posting ratings and comments online (Schlesinger et al. 2015). Provider trepidation, however, is not without merit. Users still post negative reviews, which may prove disproportionately influential depending on content and the presence or absence of other reviews that balance them out. The structure and policies of many online rating and review websites exacerbate provider concerns in this regard by not establishing mechanisms for providers to challenge or respond to the comments posted, or to have inflammatory or abusive comments removed (Lagu and Lindenauer 2010). On a more fundamental level, some providers remain skeptical of online ratings/reviews because of their lack of scientific rigor, the anecdotal character of the comments, the potential for misleading or fake reviews, and the perceived inability of consumers to evaluate the technical aspects of the treatment/services received (Luca and Vats 2013; Merchant et al. 2016; Schlesinger et al. 2015). Thus, the "sudden broad distribution of performance data can trigger defensiveness and exacerbates problems with physician morale and well-being" (Lee 2017).

To address provider concerns, some hospitals allow patients to review doctors directly on the hospital's website, claiming, for example, that this enables them to confirm that reviews come from genuine patients (Ranard et al. 2016). Critics point out that hospitals lack the requisite impartiality to decide which reviews to post. The UK has, in part, sought to increase provider comfort by instituting strict moderation standards (limiting abusive language and defamation) and granting providers a "right to reply" to the comments posted publicly on National Health Service Choices (Greaves et al. 2014b). Permitting provider responses, in

particular, has the added benefit of enabling consumers to identify which providers are most responsive to their concerns and experiences (Schlesinger et al. 2015), and fostering dialog between hospitals and patients about quality – a benefit absent in conventional patient experience surveys (Griffis et al. 2014).

Concerns about the truthfulness of reviews posted online are a major issue potentially impeding the use of online ratings and reviews. Americans are divided on this front, with one half believing that online reviews accurately represent the true quality of a product (51%) and the other half (48%) believing that it is difficult to determine whether or not online reviews are unbiased and truthful (Smith and Anderson 2016). One fear is that providers will seek to game the system by, for example, posting fraudulent reviews on their own, a colleague's, or a competitor's page, encouraging favorably inclined patients to post reviews, or disproportionately treating patients who are more likely to post positive ratings (Rozenblum and Bates 2013; Trehan and Daluiski 2016).

## Impact of User-Generated Reviews

Online rating and review websites serve in part to increase consumer confidence and comfort with their purchasing decisions. Indeed, approximately half of Americans believe that online reviews help "a lot" in ensuring products and services are safe (41%), make consumers feel confident in what they are buying (46%), and hold companies accountable to their consumers (45%) (Smith and Anderson 2016). User-generated reviews also serve in part to empower consumers by providing them with the information necessary to make informed choices and, in so doing, create incentives for improvements in quality by steering market share towards better performing providers. Because user-generated reviews offer providers opportunities to benchmark their performance and to incorporate consumer feedback into their quality improvement efforts, they may contribute to improvements in quality through provider monitoring and responsiveness to the information as well. The question, then, is: Do in fact online rating and review websites inform consumers' healthcare purchasing decisions; and does the information posted correspond with objective measures of provider quality and performance?

Some evidence indicates that online ratings and reviews may help shape consumer attitudes towards providers. Nearly 60% of respondents to a 2014 nationally representative survey reported that physician-rating websites were "somewhat important" (40%) or "very important" (19%) when choosing a physician (Hanauer et al. 2014). Moreover, 35% reported selecting a physician based on good ratings and 37% reported avoiding a physician based on bad ratings. That Americans report that extremely negative reviews are more likely to have an influence on their purchasing decisions than extremely positive reviews suggests that impact on consumer attitudes can vary with the tone of the information posted (Smith and Anderson 2016).

Direct evidence about the effects of user-generated ratings and reviews on consumer choice and provider behavior is lacking, though available evidence suggests that it may have an impact. Cosmetic surgeons surveyed in one study reported altering how they practice in light of user-generated reviews (Menon 2017). Another study found a half-star increase on ZocDoc's five-star rating scale associated with a 10% increase in the likelihood that a doctor would fill an open appointment, and that the likelihood of filling an appointment was higher among physicians with higher numbers of reviews (Luca and Vats 2013). Several studies outside the health sector suggest a relationship between user-generated ratings and business performance as well. Luca (2016) found that each one-star increase in a restaurant's average Yelp rating results in a 5–9% increase in revenue. Kim et al. (2016) found that viewing negative online reviews reduced consumer spending by about 12%. Anderson and Magruder (2012) found that each half-star increase in Yelp ratings leads restaurants to sell out available bookings 19% points more often (30% vs. 49%), with Yelp ratings having a greater impact when alternate sources of information is more scarce.

The usefulness of social media ratings and reviews are predicated on the assumption that they steer healthcare consumers toward higher quality providers. As Schlesinger et al. (2015) observe, "weak or non-existent relationships between user-generated ratings and reviews and objective measures of quality is thus problematic to the extent that they lead consumers to select providers who, in fact, delivery lower quality of care." A growing number of studies has examined the relationship between online ratings and reviews and more systematically collected measures of provider performance, including patient experience surveys and clinical quality indicators. Methods vary greatly, with studies looking at different provider types (hospitals, physicians, nursing homes), quality measures, and social media platforms, including consumer-driven (Yelp), provider-driven (Facebook), and third-party driven (National Health Service Choices) websites. Most studies demonstrate weak to moderately strong associations between provider ratings and reviews posted on social media and conventional measures of quality, including patient experience surveys, hospital readmissions, and mortality rates (Bardach et al. 2013; Glover et al. 2015; Greaves et al. 2013; Howard and Feyman 2017; Ranard et al. 2016; Timian et al. 2013). Other studies, however, examining the relationship between Facebook and Twitter content and conventional patient experience and quality indicators show no or only weak associations between user-generated ratings and reviews and provider quality (Greaves et al. 2014a; Hawkins et al. 2016; Hefele et al. 2017).

## The Future of User-Generated Ratings and Reviews

The proliferation of online rating and review websites to inform decisions in all areas of life, including healthcare, promises that user-generated ratings and reviews will increasingly drive consumer behavior. Indeed, the user-friendly nature and common knowledge of social media websites suggests that they are likely to continue building users in healthcare much faster than government and foundation-supported websites intended to support consumer decisions. Thus, it is possible that consumer feedback provided on online rating and review websites may have a stronger impact than public report cards in informing consumer behavior and in making information available to help monitor and benchmark provider performance.

The real-time availability of subjective information on provider performance reflected in widely accessed online rating and reviews websites can serve as a useful complement to the systematic but less timely measures made available on less frequently traveled government/foundation report cards. Indeed, the future of consumer decision-making aides in both spheres may lie in the integration of these two sources of information. With the help of ProPublica, an independent non-profit news organization, Yelp is pulling in data from the federal government and other sources on 4600 hospitals (emergency room wait times, communication quality, noise levels), 15,000 nursing homes (fines, payment suspensions), and 6300 dialysis centers (death rates, treatment-related hospital readmissions) (Sun 2015).

Alternatively, government and foundation report cards could incorporate user-generated ratings and reviews posted on social media sites such as Yelp or Facebook. Or, public reports cards could incorporate features that better engage consumers, including permitting them to leave their own ratings and comments about their experiences with particular providers. As noted, the National Health Services Choices website has successfully enabled consumers to post star ratings and narrative reviews on hospitals, primary care, dental and optician practices, pharmacies, and care homes since 2007 (Greaves et al. 2014b). During Choices' first 6 years, consumers left 177,854 comments and 845,363 numeric ratings, largely of hospitals and primary care practices. Permitting consumers in the USA to post ratings and reviews on US public reporting sites would similarly increase opportunities for consumers to share feedback and experiences.

The collection of user-generated reviews can be made more systematic. Options include asking

a random sample of patients to submit narrative ratings and reviews after hospital discharge (Ranard et al. 2016), and requiring a minimum number of ratings before information on particular providers are posted (Greaves et al. 2014b). Still another option would be to more fully "harness the cloud of patient experience online" (Wallace et al. 2014) by using natural language processing and data mining programs to systematically analyze review narratives for content (e.g., adverse events) and tone (e.g., positive or negative opinions/emotion). This information would benefit providers seeking to use consumer reports to identify and take action to address quality, safety, and efficacy concerns and, thereby, protect their reputations, build market share, and improve customer satisfaction and outcomes (Adams et al. 2017). It would also prove useful to government officials looking to discover incidences and patterns in consumer narratives that suggest adverse events or poor clinical performance, thus bolstering traditional quality surveillance and assurance efforts (van de Belt et al. 2015).

# Emotional Intelligence and Organizational Leadership Effectiveness in South Africa

Mokgata Matjie
Department of Industrial and Organizational Psychology, University of South Africa (UNISA), Pretoria, South Africa

## Synonyms

Effective leadership; Emotional competence; Emotional intelligence; Transformational leadership

## Definitions

*Organizational leadership effectiveness* represents the ability of a leader "to mobilize and influence followers."

*Emotional intelligence* is the ability to of use information from one's own and other's emotions to inform one's actions and thoughts.

*Emotional competence* is the ability to manage one's own emotions and manage relationships with others successfully.

*Ubuntu* is African-centered leadership, embodying the values and morals of traditional communities, but with an emphasis on transforming authoritarian systems.

## Introduction

South Africa is a developing country with only 23 years into democracy. In the past, the country was in the hands of white-minority who suppressed mostly the black South Africans. Post 1994, the first democratic elections which ushered Nelson Mandela as the first black president in the first democratically elected government, South African government aimed to transform its workforce to make it more representative and diverse to include all people from all races and genders.

In order to succeed in this transformation effort, leaders or managers in all spheres of employment needed to be emotionally competent to faces, direct and control the diverse workforce, thus effective transformational leaders. Scholars found that emotional intelligence contributes to effective organizational leadership, which subsequently culminates into overall effectiveness and efficiency of all leaders and managers. Despite that, research studies have found that emotional intelligence and effective organizational leadership is a major challenge for South Africa.

## Emotional Intelligence

Defined as "an array of non-cognitive capabilities, competencies and skills that influence one's ability to succeed in coping with environmental demands and pressures" (Salovey and Mayer 1990). Emotional intelligence as a skill is referred to as emotional competence and it has two crucial clusters for leaders, namely, as emotional expression and emotion regulation. The ability to express own feelings and verbalize own emotions represents emotional expression. The ability to stay calm and focused, thus emotionally grounded in the face of any provoking challenge or situation represents emotional regulation. Therefore, being emotionally competent implies being able to self-regulate emotions and consider and manage others' emotions, while being able to assertively express one's own feelings or emotions (Mayer and Salovey 1997). Emotions are fundamentally driving forces that arouse, direct, and sustain

leadership activity, and a as result, emotional health have some impact on the presence or absence of leadership ability on leaders.

## Organizational Leadership Effectiveness

Leadership effectiveness represents the ability of a leader "to mobilize/transform and influence followers" and is crucial in that it drives the proclivity of the workforce towards the attainment of shared goals. Leadership effectiveness is a broad concept, which embraces not only humanity but also the creation of the conditions for institutional engagement.

Leadership effectiveness also implies that the effective leaders should not only be emotionally intelligent but also be culturally well informed or possess culture intelligence. Cultural intelligence is "an individual's capability to adapt effectively to situations of cultural diversity." Leaders effective in cross-cultural leadership possess "relationship competence" in the sense that they are able to emotionally connect with diverse individuals and establish mutually attractive relationships. Cultural differences are accordingly a central situational influence in leadership effectiveness.

The point is that South African leaders, in the adoption and display of leadership styles, need to be informed by the cultural predilections of their subordinates. This is especially relevant given the extent to which the workforce is now multicultural in nature (Ng et al. 2012).

The leader's task is to structure the place and experience of such engagement to move the culture towards shared ownership. South African has major challenge culturally in the workplace because of diverse (Caucasians, Africans, Indians, Colored, and Chinese) workforce, which makes an effective leadership crucial for this context. Two leadership styles that are able to integrate transformation, inspire followers enhance humanity, and respects and follow culture are transformational and Ubuntu leadership styles.

### Transformational Leadership

Transformational leaders, in contrast to transactional and laissez-faire leaders, are seen as agents of social and organizational change and regarded as effective. They are able to inspire a new and stimulating vision in their followers. In doing so, they elevate morale, inspire followers, and motivate them toward greater achievements (Bass 1985). Research studies indicate a relationship between transformational leadership of leaders and the performance of their subordinates and between transformational leadership and the efficacy of organizations. Due to transformation taking place in the country, transformational leaders will be able to lead and transform all sectors of employment. As such, leadership effectiveness is crucial for South Africa if the needs of the nations are to be adequately served amidst transformation. And indeed South Africa needs effective leaders and managers if it has to reach its vision and mission of "together moving forward" and "a better life for all."

### Ubuntu Leadership

Relevant to South African context is the Ubuntu leadership style. U*buntu* leadership is a leadership that embodied in the two African political leaders, Dr Nelson Mandela of South Africa and Sir Seretse Khama of Botswana. *Ubuntu* leadership, like servant leadership, initiates change through people, meeting their needs to build a collective community through a shared vision. *Ubuntu* is African-centered leadership, embodying the values and morals of traditional communities, but with an emphasis on transforming authoritarian systems. *Ubuntu* values creative cooperation, empathetic communication, and team work, which could have a positive impact on dysfunctional schools that are prevalent in emerging contexts, but *ubuntu* leadership is not without its challenges (Msila 2014). *Ubuntu* requires that leaders prepare their teams to be change agents, and secondly, since some team members value their autonomy, they could consider *ubuntu* leadership intrusive. However, the application of emotional intelligence has the potential to overcome obstacles such as these.

OECD (2001) writes that effective leadership is an important and crucial variable that leads to enhanced management capacity, as well as organizational performance. OECD (2001) notes that

developing an elite leadership cadre has many advantages for any country; countries are looking to the strengthening of leadership as the solution to national public challenges, and any successful leadership strategy involves culture change. South Africa aims to develop sustainable elite leadership to face the national challenges of transformation, which will evolve in a culture of change, while embracing the various cultures in the country with 11 official languages.

For South Africa, transformational leader is like an Ubuntu leadership, because both leadership styles focus on transformation, moving away from authoritarian systems while serving the community, initiating changes, and meeting the needs of the public in general.

## Links Between Emotional Intelligence and Organizational Leadership Effectiveness

Emotional intelligence has an important role to play in the leadership effectiveness. Goleman (1998) concludes that leadership is more like an art than a science and "the most effective leaders are alike in one crucial way: they all have a high degree of what has come to be known as emotional intelligence." Goleman (2000) writes and concludes that high levels of emotional intelligence have a lead to leadership effectiveness. Emotional competence is an important element in the exercise of effective leadership.

Recent South African studies concludes that there is a link between being emotionally intelligent/competent and being an effective leader, that there is a relationship between EQ and leadership, and that *emotional intelligence and leadership styles do relate to one another.*

Along with transformational leadership behaviors, certain competencies such as interpersonal skills, empathy, and emotional intelligence are prerequisites for the success of the leader or manager (Goleman 2000). Riggio (2010: 3) writes that "that the potential a leader has to influence the emotional climate in an organization should not be underestimated."

Research indicates that leaders of private schools in South Africa are predominantly transformational in their leadership style and display spiritual characteristics (*Ubuntu)*, thus implying that these principals' emotional competence is a contributing factor to their success because private schools in South Africa perform highly. Both transformation and Ubuntu leadership lead to high-performance organizational cultures that endorse employee satisfaction. In addition, subordinates who think their leaders are effective say so because they think their leaders are transformational, transactional, empowering, and ethical leadership.

Leaders' behavior is a fundamental determinant of overall organizational effectiveness. As such, South Africa's performance will be influenced by how well leaders manage their own and their subordinates' emotions for high performance in the private sector and increased service delivery in the public sector (Goleman et al. 2002).

## The Current State of Emotional Intelligence Among Leaders in South Africa

To transform the workplaces in order to build a diverse but productive workforce, South African leaders and manager are faced with a mammoth task, which needs extraordinary leadership skills. As highlighted earlier, emotional competence enhances effective transformational and *Ubuntu* leadership practices.

Currently, South African leaders or managers lack emotional intelligence to become effective transformational leaders who will contribute immensely to the growth of the South African public sector. The public service should have leadership practices that are driven by emotional awareness and vision rather than by self-interest, which are refreshed from time to time by necessary interventions such as training programs. In addition, their performance is monitored and where people lack skills, they should be supported through training.

Currently also, the South African private sector, more especially the banking sector, experiences situations where there are crisis and transitions and need to manage paradoxes and cope with complexities, while remaining focused to sustain business success. This is a situation whereby a change in leadership or rather an effective leadership will go some way towards restoring equilibrium. Emotional intelligence is seen as a key factor for inclusion of transformational leader during this transformation and as the core rebuilding and re-establishing the social fabric and psychological climate of any organization or a country. Emotional intelligence provides a psychological climate in which people felt comfortable about questioning practices, admitting mistakes, and voicing dissonance would be a vital contributor to the effectiveness of leadership. The petrochemical sector in South Africa is affected by globalization in terms of how it conducts its business to stay abreast in terms of business strategies, management systems, and changes in technology. As such emotionally intelligent, transformational leaders are also a necessity to embrace these changes.

In the South African (SA) educational context, the current leadership does not meet the demands of a new world. Only emotional intelligence can provide a useful theoretical approach to effective leadership in an emerging South African context. South African leaders could benefit from the practice of emotional intelligence because they are under pressure to deal with a myriad of issues simultaneously.

Senior managers in Government and Private sector have an important task of transforming the strategic vision, goals, and objectives of government into effective service delivery. Unfortunately, the South African public sector is reeling from the barrage of new initiatives with respect to the government's transformation agenda and from a plethora of targets that need to be achieved in the public sector. The leadership styles and emotional intelligence of all senior managers in the public sector and private sectors' leaders will contribute to a sense of shared vision of providing a qualitative service to the public and ensuring the citizens and providing a highly competitive country in the international standards and boosting economy in the process.

## Conclusion

South Africa 23-years later is still in the transformation amid changes in leadership. Leadership changes took place but the same political party with same ideologies on leadership remains at the helm, hence blacks and women in South Africa are still marginalized. Crime is at the highest, unemployment is at the highest, poverty levels are high, HIV//AIDS infections are resurging, and many people are still dependent on government for social services such as free health, education, houses, and social grants. The successful integration of leadership's emotional intelligence in South African leaders may enable them to optimize their potential and their organizations to flourish and ultimately the country will flourish as well.

# Emotional Intelligence as an Antecedent of Leader Emotion Contrasting Behaviors

Anthony Silard
Public Administration, California State University San Bernardino, San Bernardino, CA, USA

## Synonyms

Asymmetrical outcomes; Emotion contrasting behaviors; Emotion regulation; Emotional labor; Symmetrical outcomes

## Definition

Leader emotion contrasting behaviors are agentic actions leaders can undertake to embrace and manage seemingly conflicting emotion-related demands.

## Introduction

There has been a robust organizational literature on emotion and leadership over the past 35 years (for a review, see Gooty et al. 2010). This surge in emotion research in organizations stems from a more general "affective revolution" in which both scholars and managers have taken issue with prior theories that discount emotion and have adopted theoretical perspectives that account for the affective experiences of organizational actors (Barsade and Gibson 2007).

This revolution – which starkly contradicts earlier views that employees and leaders should leave their emotions at the door before entering the office – was in many ways ignited by earlier studies by the human relations school that perceived employees as part of a social system rather than mere instruments toward organizational output. For example, a landmark study at Western Electric's Hawthorne plant found that the primary drivers of employee performance were not rationally designed mechanisms (e.g., productivity goals or the lighting of the factory floor) but the emotions and quality of interpersonal relationships experienced by team members while on the job and the resultant social processes (Roethlisberger and Dickson 1939).

Regrettably, this affective revolution has for the most part bypassed research dealing with the "asymmetrical effects" on followers generated by leader emotions. Asymmetrical effects are concerned with beneficial follower outcomes generated by negative leader emotions and detrimental follower outcomes generated by positive leader emotions.

## Symmetrical Outcomes of Leader Emotions

Before assessing the asymmetrical outcomes associated with leader positive and negative affects, I will examine the symmetrical (and more intuitive) effects of leader emotions: in other words, positive (negative) leader emotions generating beneficial (detrimental) follower and organizational outcomes. In general, emotion research in organizations supports the symmetrical outcomes of leader affect (Barsade and Gibson 2007).

According to a recent review of the emotion and leadership literature, "The dominant

theoretical theme and empirical finding . . . is that leader positive moods engender favorable outcomes for all parties, whereas leader negative moods seem to be detrimental" (Gooty et al. 2010, p. 983). Leader positive emotions have been linked to many beneficial organizational outcomes, such as follower attributions of leader charisma. In addition, leaders that express positive affect tend to receive the highest ratings from followers. These ratings are reactions to both verbal and nonverbal displays of emotion, and leaders whose nonverbal cues betray their verbal expression are penalized and rated even more poorly than those that openly express negative affect, as followers feel manipulated and have trouble trusting such "affectively incongruent" leaders (Newcombe and Ashkanasy 2002).

Most of the benefits of leader positive affect on followers are attributable to changes in follower cognition. According to the broaden-and-build model (Fredrickson 1998), positive emotions broaden follower's cognitive and attentional abilities and expand their scope of action. Individuals who experience positive emotions tend to adopt a broad-minded coping style through which they become able to view their current challenges from multiple angles.

Additionally, research by Isen (2001) has consistently found that positive emotions lead to more creative, flexible, and efficient (e.g., more likely to find a solution earlier) decision-making, including thinking that integrates more careful, systematic, precise, and thorough processing. An individual in a positive mood is also less likely to anchor on an incorrect hypothesis while exploring cognitive options. The general consensus is that positive affect is associated with more analytical decision-making that more comprehensively and efficiently integrates information and situational contingencies (see Lyubomirsky et al. 2005 for a meta-analysis).

This positive affect-induced change in cognition is particularly useful as an antecedent of follower creativity. There is strong theoretical and empirical consensus that the expanded cognitive span stimulated by positive affect enables individuals to view a larger, more diverse amount of information and access a more comprehensive set of related memories. Additionally, once the more expansive range of information is gathered, individuals experiencing positive affect process it with more flexibility and complex thinking, which allows a broader selection of elements to coalesce into a new idea, facilitating creativity (Barsade and Gibson 2007; Fredrickson 1998) – an effect that can last up to 2 days.

In sum, leader positive affect can be instrumental in generating positive cognitive follower outcomes, such as enhanced creativity, problem solving, and decision-making. When leaders express negative affect, on the other hand, they tend to induce negative emotions in followers such as fear, worry, and anxiety through emotion contagion (Hatfield et al. 1994), a two-stage process in which an individual first unintentionally mimics the displayed emotion of another person. Subsequent to mimicking the emotion displayed by the alter, the referent receives afferent feedback from the imitated vocal, facial, or postural cues that generate an affective response correspondent to the other's emotion (Hatfield et al. 1994). In other words, the follower's *display* of the emotion (while unintentionally mimicking the leader) generates internal nerve impulses and other bodily processes that induce the follower's *experience* of the emotion. This process results in the emotion being "transferred" from the leader to the follower.

These emotions are likely to lead to tense arousal and, if repeated frequently over the long term, stress. Tense arousal has been conceptualized as a state of convergence of two major components of affect, energy, and tension. This form of arousal or activation is considered an intrapersonal adaptive response to negative, unanticipated events that can lead an individual to over-focus on the negative events and even to engage in fight, flight, or freeze behaviors (Quinn et al. 2012).

Arousal, or activation, can be energetic and positive or tense and negative (Quinn et al. 2012). Arousal was initially subdivided into energetic arousal and tense arousal. Energetic arousal refers to the subjective experience that accompanies the activation of the body's subsystem in a manner that generates feelings of excitement, enthusiasm, and vitality. Energetic arousal is highly correlated with positive activation and orthogonal to tense arousal or negative activation,

which describes a feeling of anxiety or tension that renders the body similar to a coiled spring perpetually preparing for action.

Given that both energetic and tense arousals are contagious, especially when transmitted from a leader to followers, leaders must be especially sensitive in their display of negative emotions. Negative affect-imbued interpersonal antecedents such as verbal aggression, mistreatment, and conflict, in fact, are the most pernicious causes of stress and result in higher cortisol responses and feelings of distress than other stressors.

In addition to these detrimental cognitive follower outcomes of leader affect, leader negative affect engenders other negative performance outcomes. For example, an experimental study on how leaders deliver failure feedback found that negative leader affect is generative of lower leader effectiveness ratings and group performance (Gaddis et al. 2004).

## Asymmetrical Outcomes of Leader Emotions

While previous research is overwhelmingly positive about positive leader emotions (hence, "symmetrical"), some recent studies have called into question the unmitigated benefits of unhindered leader positive emotion display. A recent survey study of a large health insurance organization, for instance, found that the unbridled expression of positive emotion by leaders can degrade into a "dysfunctional strategic persistence" (Owens et al. 2015, p. 3). While it is true that a leader's expression of one specific positive emotion, recognition or praise, is one of the strongest antecedents of positive affect in followers, it is also true that these emotions can cease to generate positive affect if followers construe them as excessive or gratuitous.

Corroborating these studies, a recent qualitative study found that followers perceive leaders that display excessive positive emotion to be "glazing over what we thought were big issues" or "glossing over the truth" (Silard 2015). One informant in this study claims that their leader "tries to show very positive emotions about how things are going while on the other hand not really listening to his employees' complaints . . . he's in a different world. He doesn't know what's happening to us. He doesn't want to hear about problems. It's just like, 'Please be as positive as I am'" (p. 14).

In parallel, leader negative emotions can be generative of beneficial follower outcomes in certain situations. In general, leader negative affect possesses utility as a means to activate followers to focus their attentional energies on specific goals or issues germane to the leader's objectives. While positive emotions can generate a broadened attentional span conducive to creativity and feelings of "autonomic reactivity" and contentment in followers, the events in which negative emotions are encoded tend to be more easily and vividly accessed and recalled. Leader negative affect tends to signal to followers that a specific work outcome is important to the leader and that follower performance has been suboptimal. Consequently, leader negative affect can lead to increased follower effort expenditure and improved performance.

Much of the activation effects of leader negative emotions on followers are attributable to followers' increase in arousal, an important emotion dimension. To better understand how the dimensions of valence and arousal interact to form discrete emotions, consider the circumplex model of affect (Larsen and Diener 1992). In this widely accepted emotion model, each emotion is comprised of the two dimensions of valence and arousal. Valence ranges from pleasant to unpleasant while arousal extends from low to high intensity. Low- (vs. high-) intensity positive emotions, for example, are relaxed and serene (vs. enthusiastic and excited). Low- (vs. high-) intensity negative emotions include lethargic and fatigued (vs. tense and nervous). The four emotion poles associated with valence and arousal conjointly capture the full range of emotions (Bartel and Saavedra 2000).

The primary challenge with the usage of negative emotions by leaders to activate followers is that the tense arousal it produces is associated with stress and burnout. Not only does an individual's body feel like a coiled spring when it

experiences tense arousal, but this type of arousal narrows attentional resources and is an inefficient use of physiological and potential energy, consuming it through constant intentionality, preparation, and effort. For these reasons, tense follower arousal is strongly linked to stress. In order for the body to be able to wind down and relax, tense arousal must be transformed into energetic arousal (Fredrickson 1998).

A practical implication of this research for organizational leaders is that, following substandard follower performance or behavior the leader deems inappropriate, if the leader desires to fully engage followers and turnaround such performance or behavior, they can elect to display self-directed, low-arousal negative emotions such as concern, frustration, anxiety, or disappointment. These "light" negative emotions, if expressed with authenticity, in a situationally appropriate way, and within the context of a high-quality leader-follower relationship, can stimulate the beneficial attention-focusing effects on follower cognition without also producing the tense arousal that accelerates follower stress and burnout. (More on real-world, practical strategies for organizational leaders that involve emotion contrasting behaviors in the final section.)

## The Roles of Emotional Intelligence, Emotional Labor, and Emotion Regulation in Leader Emotion Contrasting Behaviors

Building on recent research on the asymmetrical effects of leader emotion-related behaviors (Silard and Lee 2016), leader emotion contrasting behaviors are agentic actions leaders can undertake to embrace and manage seemingly conflicting emotion-related demands. Given that both leader positive and negative affect can engender both symmetrical and asymmetrical effects in followers, an operative question to understand how leaders contrast their emotion-related behaviors is: *How can leaders express the right amount of positive and negative emotions to optimally engender positive follower and organizational outcomes*?

Emotional intelligence (EI) may play an important role as an antecedent generative of effective leader emotion contrasting behaviors. Salovey and Mayer (1990, p. 189) defined emotional intelligence (EI) as "the ability to monitor one's own and others' feelings and emotions, to discriminate among them and to use this information to guide one's thinking and actions." More recently, EI has been parsimoniously broken down into two abilities: the ability to reason about emotion and the ability to use emotions (and knowledge about emotions) to enhance thought.

The four branches of EI have been theorized to represent a set of stable mental abilities or traits (Kilduff et al. 2010) rather than behaviors. In addition, these four abilities have been argued to be cumulative such that each ability (e.g., managing one's emotions) includes the preceding abilities (e.g., perceiving, using, and understanding one's emotions), conjointly forming the meta-ability of EI (Barsade and Gibson 2007).

EI may be an important antecedent of leader emotion contrasting behaviors, as high-EI leaders have been theorized to be more adept than low-EI leaders at influencing the emotional states of others, disallowing others to influence their emotional state, and appearing unflappable even when experiencing a negative emotion (Kilduff et al. 2010).

In addition, emotion regulation – which is concerned with "the processes by which individuals influence which emotions they have, when they have them, and how they experience and express these emotions" (Gross 1998, p. 275) – is an important component of both EI and leader emotion contrasting behaviors.

Emotional labor is another important construct in the emotion literature that directly relates to emotion regulation and EI. Emotional labor is concerned with the use of emotion regulation in organizational settings to meet display requirements (Ashforth and Humphrey 1993) or an organizational form of emotion regulation. Emotional labor is also an element of both EI when practiced in the workplace and leader emotion contrasting behaviors.

To further illustrate the role of EI in enabling leaders to enact emotion contrasting behaviors, let's consider the meaning of these two concepts in practical terms. Leader emotional intelligence is a stable set of mental abilities associated with perceiving, using, understanding, and managing one's emotions and is characterized by the statement *"I understand my emotions and the emotions of others and use this understanding to guide my emotion expression."*

The statement "*Through managing the competing tensions created by low- and high-arousal positive and negative emotions*, *I balance and contrast the emotions I choose to express and help my followers to express to facilitate the achievement of organizational goals*," on the other hand, characterizes leader emotion contrasting behaviors. From these definitions, it seems likely that leader emotion contrasting behaviors will be more often selected by high-EI leaders.

## Practical Implications and Conclusion

A practical implication of this chapter is that leaders that display unmitigated positive emotions or that abstain as much as possible from expressing negative emotions are likely to be much less effective than leaders that are able to calibrate their expression of both positive and negative affect to meet organizational goals. Organizational leaders should express positive emotions when warranted (e.g., when followers expend considerable effort on a project) and remain more neutral at other times rather than appear disingenuous through the display of inauthentic positive emotions their nonverbal cues are likely to betray.

In addition, organizational leaders might increase their comfort level with the expression of "light," more self-directed negative emotions such as disappointment, anxiety, or concern when followers perform significantly below their expectations. Such emotions do not evoke the stress and burnout of more caustic, other-directed emotions such as high-level anger, rage, contempt, or disgust. When leaders express such emotions, followers are more likely to focus on their troubled relationship with the leader rather than how remiss they are in their work.

Leaders attempting to find the right balance in their expression of negative emotions might take heed of the words of an early master of emotion contrasting behaviors, Aristotle, who wrote that "It is easy to get angry – anyone can do that. . .but to feel or act toward the right person to the right extent at the right time for the right reason in the right way – that is not easy, and it is not everyone that can do it" (Aristotle, 340 BC (2009), p. 48).

# Emotional Labor

Christa L. Remington
Florida International University, Miami, FL, USA

## Synonyms

Display rules; Emotion management

## Definition

The regulation of personal emotions to reflect organizational expectations through either the display of appropriate emotions or the suppression of inappropriate ones during interpersonal transactions at work.

## Introduction

Emotional labor (EL) is the process of regulating personal emotions to reflect organizational expectations through either the display of appropriate emotions or the suppression of inappropriate ones during interpersonal transactions at work. Analogous to manual labor, emotional labor is a required part of the job and is performed in public for a wage. While manual labor involves the performance of physical work, emotional labor requires emotive work through the management and regulation of emotions. Although the concept of emotional labor originated in the field of sociology, it has recently gained recognition in the field of nonprofit management for increasing operational productivity and client satisfaction, reducing turnover, and increasing employee satisfaction. When done effectively, emotional labor makes constructive use of emotions in public service transactions in the nonprofit context. Although central to public service, EL is routinely marginalized, frequently ignored, and seldom considered as a factor in hiring, training, or determining compensation.

## Background

The term "emotional labor" was originally coined by Arlie Russell Hochschild, a professor of sociology at the University of California, Berkeley (Hochschild 1983). Hochschild noticed that flight attendants were required to practice an intentional management of their emotive displays in order to fulfill airline employee standards. At varying intervals, these flight attendants were required to express positive emotions and suppress negative ones, no matter their personal feelings, as they dealt with passengers and their needs. This led Hochschild to further research the nature of emotion work and to help define and codify an important set of skills already in widespread use.

In her book *The Managed Heart: Commercialization of Human Feeling* (1983), Hochschild described emotional labor as work that requires the regulation of experienced emotions to match organizational display rules during interpersonal transactions at work. Emotional display rules are a set of norms that regulate when, where, and how emotions may be expressed during a service transaction at work. These display rules can be explicit or implied and cross a variety of contexts, sectors, and sociocultural norms. Whether they are recognized or remain unnoticed, display rules are a

powerful shaping force that impact job performance, job satisfaction, client satisfaction, and organizational culture.

In both nonprofit and for profit organizations and in fields as diverse as construction and nursing, organizational members are tasked with performing emotional labor when dealing with clients, coworkers, and beneficiaries. In some situations, emotive work may be an overt component of job performance, while in others EL expectations are subtly embedded within organizational culture. Over the past 30 years, the emotional labor literature has developed and expanded, exploring the need for EL in fields such as health care, law enforcement, hospitality, transportation, public affairs, and intelligence (Larson and Yao 2005; van Gelderen et al. 2007; Scott and Barnes 2011). Its widespread applicability to a multiplicity of fields and contexts has awakened a need for a greater understanding of emotional labor and its parameters, exigencies, and nuances. In the nonprofit sector, where organizational members are often tasked with assisting beneficiaries that have been marginalized or have faced severe challenge or tragedy, the application of EL principles carries particular significance.

Yet for more than 20 years, the emotional labor construct had little association with the field of public administration or any overt application in the nonprofit sector. In 2004 Guy and Newman made the connection to public service for the first time in their article entitled "Women's Jobs, Men's Jobs: Sex Segregation and Emotional Labor." Since then, the existing literature on emotional labor in public administration has centered on its connection to public service motivation, its invisibility or marginalization in the public sector, and the benefits and consequences of its performance on both client and employees, including its place in the nonprofit world.

Emotional labor is multilayered and can be expressed through one of two processes: *surface acting* emotional labor and *deep acting*. Surface acting requires the workers to manage their external display of emotions (facial, body, tone of voice), without changing the true inner emotions that they actually experience. Deep acting goes one step further, requiring the worker to attempt modify these inner emotions in order to better serve the specific needs of the client (Hochschild 1983; Grandey 2000). Also known as "faking in good faith," deep acting is performed in order to express authenticity and to encourage empathy, whereas surface acting only alters the visible emotive displays. The difference between these two forms of emotional labor is important and impacts everything from employer expectations to worker health and overall organizational efficacy.

While both deep and surface acting are performed in order to meet organizational goals or standards, they have profoundly different consequences across multiple levels. Deep acting emotional labor has been shown to enhance client satisfaction in both direct and indirect ways. Clients on the receiving end of deep acting EL tend to be happier with their service experience overall, are more content with how any problems were handled, and are even more likely to make purchases from or other transactions with an organization whose employees practice deep acting over surface.

Additionally, deep acting emotional labor can also have both a positive influence on the actor performing it and on the organization as a whole. Organizations where deep acting is intentionally practiced report an increase in organizational productivity and a marked reduction in employee turnover. Deep acting is also linked to employee job satisfaction and pride in work (Hsieh and Guy 2009). The "emotional contagion" of deep acting creates a beneficial relationship between the actor and the client, with deep acting increasing client happiness and client happiness reinforcing the actor's sense of empathy, self-confidence, and successful emotive display.

In contrast to these numerous benefits of deep acting, surface acting can negatively impact a public servant's well-being. Research suggests that the sustained performance of surface acting may cause a disconnect between the emotions an employee feels and the emotions they display at work. This may occur when a negative emotion is being experienced, but a positive emotion is shown. An employee may even feel nothing when a certain emotional display is required. Therefore, the emotional labor performed is not the suppression of

emotion, but the expression of one not felt. This discrepancy, referred to as *emotional dissonance*, has been argued to be a source of mental and emotional strain that threatens employee well-being and leads to burnout, high turnover, and low job productivity (Grandey 2000; Hochschild 1983; Morris and Feldman 1997; Hsieh et al. 2012). Actors experiencing emotional dissonance may feel hypocritical, embarrassed, distant from their own emotions, and emotionally exhausted. Those engaging in deep acting, however, fare far better, experiencing less emotional dissonance and therefore less negative consequences of their emotive work.

But the negative consequences of surface acting are not limited to the actors alone. Research indicates that surface acting can have negative results for clients and beneficiaries and therefore broader repercussions on the larger organization. Clients on the receiving end of surface acting have been shown to be less satisfied, less cooperative, and less likely to engage with the organization in the future. In nonprofit organizations, the ramifications can be systemic, impacting everything from client satisfaction to donor retention. While negative emotions may be fairly easy to suppress, research suggests that positive emotions are harder to feign. This may be because disingenuous emotional displays can send subtle cues of insincerity to the client that belie expressed intention resulting in decreased trust and satisfaction on the part of the client (Zapf 2002). Just as deep acting EL can trigger a beneficial cycle between actor and client, surface acting can trigger a negative cycle that leads to greater distress for both parties and carries implications for entire organizations and public service as a whole.

## Emotional Labor Versus Emotion Work and Emotional Intelligence

The terms "emotion work" and "emotional intelligence" are often confused with emotional labor. Emotion work, which also requires the management of emotions, occurs outside of work in the private sphere, and not for a wage. The concept of emotional intelligence, while similar in result, differs from emotional labor in its intent. Before the late nineteenth century, the concepts of emotional labor and emotional intelligence and their impact on workplace performance were relatively unknown and unresearched. But by the mid-twentieth century, researchers began to recognize that emotions, and their expression or suppression, have a profound and complex effect on a person's workplace performance. As with physical labor, emotional labor can be both draining and energizing and can be honed to various levels of skill.

Although the terms emotional intelligence and emotional labor are often used interchangeably, they are not synonymous. Emotional intelligence refers to the abilities needed to recognize and manage emotion in oneself and in others with whom one is interacting (Goleman 1998). This capacity for understanding and regulating personal emotions differs from the "skill" known as emotional labor. Unlike emotional intelligence, which utilizes genuine emotions, emotional labor involves the production or acting of emotions that the worker does not genuinely feel or the conquest of emotions that are not appropriate for a specific setting (Hochschild 1983). Therefore, it is an individual's level of emotional intelligence that enables them to perform emotional labor; the higher the emotional intelligence, the higher the ability to perform emotional labor. Unlike emotional intelligence, emotional labor as a skill can be developed over time, included in employee training, and assessed in performance evaluations. While such codification of emotional work is still rare within public service organizations, the recognition of its importance is increasing.

## Emotional Labor in Public Administration

Researchers from diverse fields have studied emotional labor, and it has come to be recognized as central to all health and human service professions which require direct contact with clients (Guy and Newman 2004, 289). Emotional labor also plays a critical role in the effective delivery of public service during face-to-face or voice-to-voice exchanges between workers and citizens. During

these interactions, public servants must assess the affective state of the citizens and adjust their own emotive behaviors to meet organizational expectations.

Although emotional labor is central to public service, it is routinely marginalized and often completely ignored in the workplace. Public sector job descriptions frequently only include measurable skills and experience, while performance evaluations also neglect to recognize emotive skills, often treating them solely as ancillary, soft skills that are taken for granted (Steinberg 1999). With few exceptions, compensation determination rarely includes the effort and stress required to perform emotional labor nor compensates for the time, effort, and experience required to develop high-level emotional skills. This lack of compensation or recognition of strenuous effort, skill, and experience can lead to employee frustration, exhaustion, anxiety, and stress.

According to Guy and Newman (2004), although often unrecognized, emotion work is central to most public sector jobs and can actually increase organizational productivity and client satisfaction. They identify four steps involved in the performance of emotional labor by a public servant: first, *emotive sensing* which detects the citizens' affective state and uses that information to array one's own alternative responses; next, *analyzing* one's own affective state and comparing it to that of the citizens; third, *judging* how alternative responses will affect the citizens and selecting the best one; and, finally, *behaving* to suppress or express an emotion in order to elicit desired citizen responses. These four steps, involved in deep acting, help the public servant better consider the perspective of the client and act in the best interest of the public in a more humane and compassionate manner.

Emotional labor not only benefits the public but also has profound implications for the public servant. Those engaging in deep acting have been shown to have higher job satisfaction and pride in the work they do. This may be, in part, because they are connecting with the public they serve in a meaningful and effective way. This job satisfaction translates into a reduced turnover rate among employees. When satisfied employees strive for excellence, it has a beneficial impact on public trust by giving the client the expectation of quality as well as confidence in the positive intentions of the administrator.

## Emotional Labor in Disaster Response and Recovery

While emotional labor is a critical component of all public service, during times of post-disaster response and recovery, the need for it is particularly high. For aid workers, who bear continual responsibility for those who have been the victims of disaster, the stakes are even higher. The success or failure of their emotional labor can have grave personal, emotional, and physical consequences. Furthermore, response and recovery workers must manage the emotions of those impacted by the disaster all while carefully managing their own emotive displays. Such high-intensity EL is also seen among nurses, emergency room doctors, firefighters, and first responders. The sustained exertion required to perform emotional labor in often complex situations is gaining increased recognition in the disaster response and recovery world as a vital job requirement.

The current body of literature shows that emotional labor skills, such as the ability to show appropriate emotions (hope, empathy, calm) while suppressing inappropriate emotions (e.g., anger, anxiety, powerlessness, sadness, stress), are necessary as part of a relief worker's professional skill set (Mann 1997). Aid workers engaging in deep acting have been shown to have higher job satisfaction and pride in their work, as they connect with victims in significant ways (Hsieh and Guy 2009). In contrast, aid workers who continually practice surface acting emotional labor are more prone to burnout and have far higher turnover rates than those who practice deep acting.

Response and recovery workers are not immune to the consequences of sustained emotional labor. Previous emotional labor studies and psychological and anthropological research on emergency responders suggest that, in the quest to meet the needs of the victims of disasters, oftentimes the aid workers suffer intensely. By frequently undergoing a high degree of sustained emotional labor, aid workers become susceptible

to emotional exhaustion, compassion fatigue, burnout, and long-term physical and mental and physical health consequences (Adelmann 1995; Grandey 2003).

## Emotional Labor and Public Service Motivation

Research also links the successful performance of emotional labor to public service motivation, which is an individual's predisposition to be motivated to perform meaningful public service. Public servants who rate higher in public service motivation perform more deep acting emotional labor, which improves client satisfaction. Perry (1996) suggested that two of the four dimensions of public service motivation, attraction to policymaking and compassion, are linked to deep and surface acting and to self-sacrifice. An attraction to policymaking is positively linked with surface acting, while compassion is negatively associated with surface acting but positively associated with deep acting (Perry 1996).

Compassion, which is a sense of caring and connectedness, helps the public servant, including the nonprofit worker, to step into the citizen's shoes and perform emotional labor. It is a key component of the empathy necessary to alter one's feelings and emotional display in trying situations. Deep acting draws upon empathy and allows the public servant to see the situation through the eyes of the client, mirroring client emotions and affective displays. Because of this, during deep acting, the worker does not find it necessary to fake emotions and therefore experiences less emotional dissonance and less emotional distress when performing emotional labor at work.

## Conclusion

For decades, public administration scholars have argued that compassion and benevolence should be important administrative values, both as agents of rectitude and in order to increase public trust. In fact, proponents of the new public service paradigm suggest that the job of public servants and nonprofit workers is not just to make their work more efficient, but to make it more humane and caring. Effective utilization of emotional labor processes encourages authenticity, empathy, and humaneness on the part of the actor and is an antecedent of client trust and satisfaction. These, in turn, encourage both organizational health and program efficacy. Because of this, emotional labor, and deep acting in particular, is an important tool of public service.

Moreover, more than 30 years of research have shown that emotional labor is a definable skill and that it can be documented, encouraged, analyzed, and taught. EL plays a critical role in the operation of the nonprofit sector and is increasingly being sought during hiring and including in public service training. Because of this, many of the scholars participating in the emotional labor literature argue that EL should be formally recognized for its contribution to nonprofit sector job performance, that it should be justly compensated for, and that it should be intentionally incorporated into the public administration curriculum (Mastracci et al. 2010).

## Synonyms

Emotional labor; Emotional intelligence; Job performance; Public and private organizations in China

## Definitions

Emotional labor is the process of regulating emotional expressions for organizational goals. Emotional intelligence involves the ability to perceive, understand, appraise, and express emotion, coupled with the ability to generate and regulate feelings.

## Introduction

Emotional labor involves the management of feelings to create publicly observable expressions that are in accordance with the display rules established by organizations (Hochschild 1983). The display rules that shape the expression of such emotional labor are associated with occupational norms and organizational contexts (Grandey and Melloy 2017). Thus, due to the difference in management approaches, culture, and norms, emotional labor may differ in public and private organizations. Accordingly, emotional labor may impact upon job performance in public and private organizations, but this relationship is subject to emotional intelligence available (Newton et al. 2016). Specifically, this paper discusses differences in emotional labor among managers and professionals working in Chinese public organizations (CPOs), foreign-invested enterprises (FIEs), and Chinese privately owned enterprises (POEs), as well as differences in the relationships among emotional labor, emotional intelligence, and job performance.

## Different Emotional Labor across Organizations of Different Ownership Type in China

Different work environments impact upon the level of emotional demands prescribed by work situations. Two theoretical approaches offer a useful lens for understanding how environmental factors influence the organizational requirements for emotional expression (Lawler and Thye 1999; Lively and Powell 2006): the cultural-normative approach and the structural-relational approach.

The cultural-normative approach highlights the role of emotional norms and display rules in a social context, while a structural-relational approach emphasizes the impact of social positions (e.g., power and status) on the emotions that people are likely to feel. The cultural-normative perspective implies that, while emotional norms shape emotional expressions or displays, they vary across social or organizational contexts. Morris and Feldman (1996) propose that, at the organizational level, the explicitness of display rules, routineness of task, form of interaction, and job autonomy are associated with emotional labor behavior. Additionally, the requirements for emotional labor are associated with features of organizational cultures (e.g., Gardner et al. 2009). The structural-relational approach proposes that positional differences lead to divergent felt emotions, which in turn have important effects on exchange relations and networks (Lawler and Thye 1999). Specifically, for instance, low status employees are more likely to experience negative emotions and are more apt to conceal them from group members, thus engaging in emotional labor.

With regards to expressions of emotional labor, it is particularly interesting to look at countries like China that are transitioning from predominantly state-owned enterprises (SOEs) to a multiple ownership system. This structural system includes public organizations represented by SOEs and other public organizations funded by the government. There is also a growing private sector represented by foreign-invested enterprises (FIEs) and domestic privately owned enterprises (POEs) (Ma et al. 2016). A major issue to keep in mind with these transitions is that Chinese public organizations (CPOs) are constrained by their historical heritage, hierarchical structures and systems, and some governmental control, while private enterprises have greater flexibility and autonomy to run their business.

Although organization's HR practices influence emotional labor (Gabriel et al. 2016), studies in China also reveal differences in HRM practices according to different ownership forms (Ma et al. 2016). Foreign-owned enterprises use more formalized and transparent bonus systems through the transfer of high-performance human resource systems of their home country. Employees are motivated through transparent, open and fair remuneration practices and approaches that promote employee development, as well as a warm and friendly climate (Jaussaud and Liu 2011). Compared to the HRM practices of FIEs, the systems of Chinese owned firms are much less transparent, with supervisors having stronger levels of personal influence. For example, the HRM systems of Chinese privately owned enterprises are generally pragmatic, non-systematic, and informal.

The different clusters of firms that characterize the three ownership types also lead to different organizational cultures. Tsui et al. (2006) note that both foreign and domestic private firms have highly integrative cultures that emphasize internal integration and external adaptation, while public organizations have a hierarchical culture. Thus, differences in HRM approaches and organizational cultures in these three types of organizations may influence emotional labor in different ways.

The current study of Chinese managers aimed to fill the gap in the limited knowledge about the effect of the contextual factors of organizational ownership type on emotional labor. Specifically, this study reported a significant difference in emotional labor demands between Chinese public organizations and private sectors. Professionals working in POEs and FIEs showed significantly higher levels of emotional labor than those working in CPOs. Two explanations are offered. First, most private organizations are market-driven and pursue the philosophy that "the customer is king." Employees working in private sectors experience more emotional labor when interacting with external customers (see Bolton 2002). Moreover, private sectors stress the achievement of performance and economic goals more than the public sector, which could be an important impetus for emotional labor. On the other hand, public organizations are less performance-driven and employees may have less pressure to engage in emotional labor for in-role performance. The data from this study do reveal that job performance in

the public sector was significantly lower than in the private sector.

In addition, employees working in the public sector in China are more likely to enjoy greater power and status, and thus face less pressure to meet the needs of their external customers. People working in the public sector in China enjoy a high status and less emotional labor when working with their external customers due to the high-power distance culture in China. High-status people are thought to enjoy more freedom in their emotional expression and hence may put less effort into their emotional management (Lively 2000). As others state (Brotheridge and Grandey 2002), occupational types contribute to the reported levels of emotional labor. In addition, the study's findings suggest that ownership type is a potentially new antecedent of emotional labor.

## Association Between Emotional Labor and Job Performance

The literature tends to support the idea that emotional labor is positively related to work performance (Goodwin et al. 2011). The current study also reveals that overall those individuals who are skilled at managing and displaying emotions are likely to have better job performance. However, when examining the managerial samples of private and public sectors separately, emotional labor was a valid predictor of job performance only in CPOs and not in FIEs or POEs. These different results for the association of emotional labor with job performance further illustrate that organizational environments in the public and private sectors in China shape employee emotional labor behaviors in different ways. First, though employees in both FIEs and POEs report higher levels of emotional labor than their counterparts in CPOs, their job performance is not affected by their emotional labor. This is interesting because it suggests that organizational HRM practices, culture, and norms that are associated with ownership types might be the more critical factors that impact upon the role of emotional labor upon job performance.

Emotional labor is subject to bureaucratic forms of control such as the nature of supervision from superiors, as illustrated by the CPOs in this study, which are characterized by a more hierarchical structure, bureaucratic culture, and significant status differences (i.e., power distance). Therefore, on the one hand in public organizations, "getting-the-job-done" on a daily basis depends very much on "guanxi" (relationships) with colleagues and particularly with supervisors, as job autonomy is much more constrained in the public sector. On the other hand, performance appraisal in Chinese public organizations is subject to the supervisor's personal judgment and favoritism as objective performance criteria are absent or vague. Therefore, developing and maintaining good "guanxi" with the supervisor and colleagues are critical in achieving positive performance evaluation for job performance, and such high-quality relationships involve efforts around emotional exchange.

Given the hierarchical differences in social status and the vague display rules in such Chinese organizations, employees in CPOs need to engage in emotional labor to develop personal relationships with colleagues and particularly with their supervisors. Moreover, the traditional influence of collectivistic cultural values around harmony and cooperation within a group is more prominent in CPOs than in FIEs and POEs. On the contrary, as considered earlier, in private enterprises, job performance is more merit-based with more explicit and objective criteria and less influenced by the personal influence of supervisors. Therefore, despite employees in private organizations performing more emotional labor with external customers, the overall influence of emotional labor on job performance is constrained.

Moreover, the study's finding that emotional labor has no relationship on job performance in the private sector is similar to previous studies conducted in the West (e.g., Mesmer-Magnus et al. 2012). This finding may imply that employees working in FIEs and POEs may experience demands around emotional labor in their organizations that are identical to their counterparts in Western countries, suggesting that HRM practices in the POEs are converging toward those practices of FIEs in their country of origin (see Ma et al. 2016).

## Moderating Effect of Emotional Intelligence on the Relationship Between Emotional Labor and Job Performance

Emotional intelligence involves the ability to perceive, understand, appraise, and express emotion, coupled with the ability to generate and regulate feelings (Mayer and Salovey 1997). Emotional intelligence is especially important as a factor in the relationship between emotional labor and job performance. A moderator role of emotional intelligence is theoretically supported by the conservation of resources (COR) theory (Hobfoll 1989), which postulates that personal resources (e.g., emotional intelligence) may mitigate efforts to display appropriate emotions. Researchers contend that high emotionally intelligent employees perform better than low emotionally intelligent employees at jobs that demand emotional labor (e.g., Joseph and Newman 2010).

Among these public and private organizations investigated in China, the moderating effect of emotional intelligence on the relationship between emotional labor and job performance only exists in public organizations and is not present in private organizations. In Chinese public organizations, emotional labor is more strongly related to job performance in the case of high emotionally intelligent employees rather than in low emotionally intelligent employees. In explaining these different results in public and private organizations, one interpretation lies in the differences in emotional norms, display rules, and social positions in the two types of organizations. The explicitness of rules (e.g., objective performance indicators) and the highly integrative cultures in private organizations, encourage their employees to rely less on leveraging on emotional intelligence to perform emotional labor to achieve job performance. However, the greater ambiguity of display rules, more hierarchical cultures, higher levels of position power, and significant personal influence on job performance from supervisors in public organizations encourage employees to leverage on their emotional intelligence to engage in displays of emotional labor with insiders that best allow them to gain desirable job performance. In other words, in the bureaucratic public sector, subordinates are evaluated more by the superior's personal judgment, and their personal and political fortunes are determined by how their superiors judge their performance. Therefore, it is natural to expect those working in Chinese public organizations to leverage on emotional intelligence to "please" supervisors for favorable judgments of job performance.

## Implications for Practice

These findings highlight that organizations need to be aware of the association between emotional labor and the organizational context created and supported by their existing HRM and other practices. For example, more explicit display rules and autonomy-supportive policies may promote employees to engage in emotion regulation in a more positive way. In this regard, public organizations are encouraged to benchmark the management approach adopted by private organizations by developing more transparent HRM practices and by creating more positive work climates for their workforce. This recommendation is in line with the New Public Management (NPM) rhetoric and transference of management practices from the private to the public sector.

In addition, while many studies on emotional labor highlight the importance of person-job fit, this study identifies the importance of person-organization fit. For example, given the significant roles of emotional labor and emotional intelligence in public organizations, these organizations may need to consider assessing the emotional intelligence of candidates in the recruitment of employees. Moreover, given the significant levels of emotional labor reported by the samples of managers and professionals, organizations should consider, and weigh up the costs of emotional labor on their employees. In addition to the provision of emotional management training, the employment of more humanistic practices to replace emotional display rules might be one beneficial strategy.

## Conclusion

The public and private sectors in China exhibit significant differences in their emotional labor

demands, revealing ownership type as a new antecedent of emotional labor. Second, emotional labor has a significant effect on in-role performance, and emotional intelligence moderates the link between emotional labor and job performance in public organizations, but not in private organizations.

# Emotional Management

Michael W. Kramer
University of Oklahoma, Norman, OK, USA

## Synonyms

Emotional control; Emotional display; Emotional expression

## Definition

Emotion management describes the process by which individuals in organizations maintain a balance between the competing goals of expressing their felt emotions and displaying the emotions that are consistent with the social and cultural norms of the organization.

## Introduction

Participation in organizations results in various emotional experiences, both positive and negative ones. For example, if two employees applied for a

promotion in a nonprofit organization, the employee who received the promotion likely feels a level of positive exuberance, while the employee who did not receive the promotion likely has a negative reaction and perhaps even feels angry. The free expression of positive and negative emotions in organizational setting is often viewed as an unacceptable violation of either job expectations or social norms. As a result, individuals are expected to manage or control their emotions to varying degrees. The employee who received the promotion in the previous scenario would be criticized for behaving inappropriately if expressing the positive emotion involved running around the office hugging everyone and shouting, "I got it; I got it." Similarly, the employee who did not receive the promotion would be criticized for constantly expressing a negative attitude toward the nonprofit in general and the person who received the promotion in particular. Emotion management involves the process of maintaining a balance between the emotions individuals feel and the emotions that they are expected to express according to social norms and organizational expectations. To understand emotion management in organizational settings, it is important to understand (a) the nature of emotions in organizational experiences, (b) the different types of emotions that are frequently studied in organizations, (c) the social norms that influence the management of the expression of emotions in organizations, (d) the way those social norms or expectations are learned, and (e) the impact of emotion management on individuals.

## The Nature of Emotions in Organizations

Emotions are a complex mixture of both physiological and cognitive factors. In other words, the feeling of emotion is the result of both physical and mental responses to experiences. For example, if a volunteer or employee of a nonprofit organization is treated rudely by a customer or community member, the volunteer likely will have an increased heart rate while mentally evaluating that individual's behavior as undeserved and inappropriate. Researchers have disagreed on whether the physical or cognitive response comes first. It is likely that the order varies according to the situation and the individual and that in many instances the physical and cognitive responses occur almost simultaneously, making the distinction in order unimportant.

Many scholars agree that emotions in organizational settings are triggered by discrepancies or differences between individuals' expectations for a given situation and their actual experiences. Individuals bring a wide range of expectations to their organizational experiences. They expect that they will demonstrate competence, commitment, and integrity in completing their work assignments; develop and maintain positive relationships with coworkers, supervisors, and other people like customers or clients; and establish and maintain appropriate boundaries between their professional work and their personal lives (Carver and Scheier 1990). When those expectations for work, relationships, and work-life balance are not met, it results in an emotional response. When the expectations are hindered or interrupted, the results are unmet expectations and negative emotions. When the expectations are achieved more easily, quickly, or successfully than anticipated, the results are overmet expectation and positive emotions. Extending the earlier scenario, if the employee of the nonprofit expected to get a promotion after 3 years, but received it after just 1 year, the overmet expectations would result in a strong positive emotion. If the other employee of the nonprofit expected to get a promotion this year and was denied it, then the unmet expectations would result in strong negative emotions. Similarly, employee and volunteer expectations for developing positive relationship with others at work and for being able to maintain work-life balance can be overmet or unmet resulting in similar positive or negative emotions.

A number of scholars have tried to classify the different emotions that individuals experience in organizational settings as positive or negative. In one of the more comprehensive analyses of different emotions, through statistical analyses, Shaver et al. (1987) identified six primary

emotions for classifying most emotions. The three positive emotions likely to occur from met or overmet expectations included love (e.g., liking, fondness), joy (e.g., enthusiasm, happiness, pride), and surprise (e.g., amazement, astonishment). The three negative emotions likely to result from unmet expectations include anger (e.g., irritation, disgust, jealousy), sadness (e.g., hurt, dismay, isolation), and fear (e.g., alarm, shock, anxiety).

## The Types of Emotions in Organizations

Scholars have studied emotions in organizations from a variety of perspectives that go beyond simply identifying the nature of the emotion. In a comprehensive examination of these perspectives, Miller et al. (2007) identified five general types of emotions that are examined in organizational settings.

The first type of emotion studied is *emotional labor* (see Emotional Labor entry for further elaboration). Hochschild (1983) first identified emotional labor in her study of flight attendants. She found that flight attendants were trained to express positive emotions to customers regardless of their actual feelings. So, for example, flight attendants were expected to smile and be polite no matter how rude customers might be, and they were to act calm and collected regardless of their personal feelings in the case of heavy turbulence or an emergency. Hochschild went on to differentiate between *surface acting* when the attendants knew that they were being inauthentic and *deep level acting*, when the flight attendants lost touch with their own feelings while expressing the organizationally prescribed emotions. Emotional labor, then, occurs when individuals express inauthentic emotions as part of their work for the benefit of organizational goals. Emotional labor is a common practice in customer service activities, which for a nonprofit organization could include providing community services or disaster relief. Emotional labor does not always involve expressing positive emotions. Individuals involved in occupations such as corrections or bill collection perform emotional labor by learning to express the correct amount of negative emotion to encourage compliance with their requests to individuals who are often unwilling to fulfill the request. Employees or volunteers may need to learn to express negative emotions to discourage individuals or clients who seem to be taking advantage of the services that the nonprofit organization provides.

The second type of emotion studied is *emotion work*. Emotion work involves a genuine emotional response to the emotions of others, usually customers or clients, as part of a job. Emotion work is particularly common in human service activities that involve providing assistance to others through close personal interaction. For example, hospice volunteers frequently speak of feeling like they are friends and family members of their patients due to the emotional attachment they develop with them (Gilstrap and White 2013). These emotional attachments are authentic, felt emotions that result from working closely with their patients. Emotion work is common for employees and volunteers in social work, health care, and educational and religious organizations among others.

The third type of emotion that has been studied is *emotion with work* which refers to reactions to interactions with peers, supervisors, and other organizational members rather than with customers or clients. Emotion with work is related to the expectation of achieving positive work and relational goals. Employees and volunteers experience positive emotions when they receive positive feedback on making progress in mastering or completing a new job or when they develop a close relationship with their supervisors or peers; they experience negative emotions when they have trouble maintaining a good relation with their supervisor or their peers or receive negative feedback on their work efforts (Carver and Scheier 1990). Regardless of whether they are employees or volunteers, positive or negative relationships with supervisors or coworkers (possibly other volunteers) contribute to emotion with work.

A fourth type of emotion studied has been labeled *emotion at work*. Emotion at work is not related to what occurs in the work setting.

Emotion at work occurs when employees or volunteers have experiences away from their work that interfere with the individuals' ability to concentrate and be effective in their work at the nonprofit organization. Emotion at work is caused by a general work-life balance conflict where the overlap between activities and roles outside an organization interferes with work within the organization. Common causes for emotion at work are problems with child raising, such as an illness, or needing to provide assistance for elderly parents. Not all emotion at work is related to personal relationships. Emotion at work could be the result of car problems, financial concerns, or the stress of trying to complete routine activities like grocery shopping or yard work. In addition, events in the community, the nation, or the world could cause emotion at work. Stress in other areas of an individual's life create conflict for individuals as they try to maintain their employee or volunteer role in a nonprofit organization.

*Emotion toward work* is a more general affective reaction to the work in the nonprofit than emotion with work. As such, emotion toward work is closely related to job satisfaction. Employees and volunteers have generally positive attitudes toward their work in a nonprofit when it exceeds their expectations and negative ones when it fails to meet those expectations. For example, volunteers for Habitat for Humanity respond positively when the workday is organized, and they feel that they are making significant contributions, but respond negatively when they seem to be wasting their time waiting for something to do (Hale and James 2013). There are literally thousands of studies exploring how emotion toward work impacts employee turnover, but not many for volunteers. However, the findings are not as strong as might be expected. Employees who have a negative emotion toward work often stay in jobs when they feel that the alternatives are even less desirable, such as being unemployed or working for an even less desirable organization. As a result, job dissatisfaction is only a moderately strong predictor of turnover. However, since volunteers turnover at a much higher rate than employees, the impact of emotion toward work may be much greater, because when individuals have trouble managing between work, family, and volunteer roles, they most likely reduce their volunteer roles.

## The Social Norms of Emotion Management

The previous section identified some of types of emotional experiences that are commonly studied in organizational settings. It focused on the emotions individuals feel, that is, their positive or negative *felt emotions*. In organizational settings, individuals are often discouraged from expressing their felt emotions and instead are asked to manage the *display of emotions* in socially appropriate ways. The social norm for the display of emotions is most obvious in settings involving emotional labor. In emotional labor, individuals are taught to suppress their felt emotions and present the appropriate display of emotions. For example, for employees or volunteers of nonprofits, emotion management includes displaying the positive expressions of customer service representatives or the negative expressions of concern and criticism of individuals misusing the services of the organization.

In some organizational roles, emotion management involves the expectation for a neutral or unemotional control of the display of emotions. For example, 911 operators are expected to be calm and unemotional no matter how chaotic the situation or how emotional the caller may be (Shuler and Sypher 2000). Interestingly, many of the 911 operators in the study enjoyed managing their emotions in those situations because it showed their competence in their jobs. For many of them, managing their emotions provided the challenge and excitement for a job that was frequently routine and uneventful. So unlike emotional labor which may force individuals to display inauthentic emotions prescribed by the organization, the 911 operators in the study actually sought out opportunities to manage their emotions and display a calm or neutral demeanor as a demonstration of their competence. Volunteers or employees working on other hotlines likely experience similar emotions as they respond to callers.

Public servants, such as employee or volunteer first responders, are also often expected to maintain a neutral unemotional demeanor regardless of the situation. For example, firefighters often feel strong negative emotions, especially when there is the loss of life of a small child, but act unaffected by personal emotions and maintain a neutral display of emotions as they interact with the public or family members of the victims; they only express their felt emotions when they are back at their fire station out of view from the public (Scott and Myers 2005). Maintaining the neutral demeanor in these sorts of situation seems comparable to emotional labor in that it involves the display of organizationally prescribed emotions. This situation is different in that the emotion management serves the victims and their families rather than the organization.

Whereas the previous examples of emotion management all involve dealing with people outside of the organization like customers or the public, emotion management is also involved in internal interactions within organizations. Organizational members need to maintain positive relationships with their subordinates, coworkers, supervisors, and other organizational members. If employees and volunteers expressed their positive and negative emotions in the workplace without any filtering, it often would be difficult to maintain relationships. Research by Kramer and his colleagues suggest that people are expected to display a "professional" demeanor in their interactions with each other in organizational settings (Kramer and Hess 2002). The participants never clearly define professionalism, but they seemed to generally agree that the expectations are clear. In most situations, organizational members are expected to maintain a neutral to moderately positive display of emotions regardless of their felt emotions. For example, although an individual may be excited about getting a positive evaluation or a promotion and raise, examples of emotion with work, a professional display of emotions will be only moderately positive so as not to upset those who got less positive news. Similarly, an individual who is experiencing marital problems, an example of emotion at work, is expected to be professional and display a neutral or positive emotion to avoid letting the activities away from the organization to influence the work environment in a negative way for the individual or other employees or volunteers.

The discussion of emotion management norms so far may suggest that individuals always have a choice to suppress their felt emotions when they are inappropriate and can choose to display the socially or organizationally appropriate emotion. While the ability to management emotions is common in organizational settings, situational factors may affect an individual's ability to manage their emotions in socially appropriate ways. For example, when the catalyst for the emotion is particularly intense or occurs repeatedly, individuals may lose their ability to manage their emotions. For example, a customer who is excessively rude and swears repeatedly at a customer service representative may exceed that individual's tolerance level such that the person becomes rude and negative in return despite training on the appropriate display of positive emotions. Similarly, a coworker who repeatedly prevents someone else from achieving their goals may receive an unprofessional response at some point.

By contrast to situations when they are unable to control their negative emotions as prescribed by the organization, an employee or volunteer may decide to display positive emotions despite organizational sanctions against doing so because it seems more appropriate to do so. For example, Onyx (2013) found that one nonprofit organization discouraged volunteers from spending too much time with clients and encouraged them to avoid expressing feelings by touching or hugging them. Participants in the study reported deliberately breaking those expectations because they wanted to develop more positive relationships with the clients they visited and wanted to express their felt emotions to them.

## Learning Emotion Management Norms

The discussion so far has described the norms or expectations for emotion management without addressing the issue of how individuals learn the

emotion management expectations. In organizations in which employees participate in emotional labor, organizations follow a three-step process for developing employees who will manage emotions so as to display the appropriate emotions. First, during the recruitment process, the organizational recruiters look for individuals whose personalities are consistent with the emotion display expectations of the organization. Second, during orientation and training, new employees or volunteers are taught to display the correct emotions. Third, while they are on the job, they are rewarded for managing their emotions appropriately. This three-step process results in employees and volunteers who manage their emotions according to the organizational expectations.

A popular amusement park provides a clear example of how these three steps work for employees according to research by Van Maanen and Kunda (1989). During the selection process, the recruiters look for individuals with outgoing and pleasant personalities. During training, the new employees are explicitly taught the emotion display expectations. This includes understanding that onstage, defined as anywhere that customers may see the employees, the employees are expected to display positive emotions whether they are a ticket taker, ride operator, or simply a street cleaner. Calling the employees "cast members" reinforces the notion that they are to perform surface acting by displaying certain emotions regardless of their felt emotions. It is only backstage, in tunnels or other places where customers do not have access, that employees do not need to display proper emotions. Finally, supervisors monitor employees to try to catch them out of character—that is not displaying the appropriate positive emotions. Those who fail to display the appropriate positive emotions receive negative evaluations, can be demoted to less public jobs or less desirable jobs, and may even be dismissed for repeated violations of the emotion display expectations. Interestingly, the employees sometimes develop covert forms of resistance such as enacting what appears to be an inadvertent seatbelt slap of customers who are uncooperative or rude. In this way, the selection, training, and evaluation process reinforces the appropriate emotion management behaviors, but some employees secretly resist the norms.

For many other occupations, the expectations for "professional" display of emotions are never explicitly taught (Kramer and Hess 2002). The employees learn the emotion display norms implicitly through their education and their previous experiences as employees or volunteers and by observing other organizational members. Employees who enter a career similar to their parents are at an advantage since they learn many of the occupational expectations through family interactions. Others must learn the emotion management expectations after they join the organization. The lack of explicit training on emotion management may be problematic employees or volunteers who do not have parents or other mentors to help them learn the appropriate emotion display norms for their activities in a nonprofit organization.

## Impact of Emotion Management

The amusement park example in the previous section indicates that following the correct emotion management norms has career implications for its employees. The conditions at the amusement park may seem extreme and related to a particular occupation; however, evidence suggests that similar practices explicitly and implicitly exist in other organizations and that emotion management influences the careers of many employees. For example, Van Maanen and Kunda (1989) found similar patterns of hiring, training, and reinforcing of emotion management expectations in a high-tech company where employees were expected to display the correct attitude. Success in the organization is related to following the emotion management norms by expressing enthusiasm and a positive attitude toward the organization's culture. Employees and volunteers in nonprofit organizations similarly need to adapt to the organizational norms for emotion management in order to achieve their goals for participating in the organization.

Other research suggests that emotion management expectations impact many organizational

roles. For example, individuals who display positive affect through their nonverbal communication during initial job interviews are more likely to receive second interviews which lead to job offers across a range of occupations. Professional emotion management also seems to affect career success in general. Expressing more positive emotions is associated with higher supervisor evaluations, larger pay raises, and more support from peers and coworkers. A recent study found that new volunteers were reluctant to develop relationships with older volunteers when the experienced peers held what were perceived as gripe sessions instead of expressing positive attitudes toward their nonprofit organization (Kramer and Danielson 2016). Overall, these findings suggest that emotion management is associated with achieving various career and relational goals for volunteers and employees in nonprofit organizations as well.

## Conclusion

Emotions are a common experience in organizational settings including nonprofit organizations. Emotions occur when employees and volunteers experience discrepancies between their expectations and their experiences in organizational settings. These interruptions of expectations lead to positive felt emotions when they exceed expectations and lead to goal achievement or negative felt emotions when they are less than expected or hinder goal achievement. The felt emotions may be related to emotional labor, emotion work, emotion with work, emotion at work, or emotion toward work. Employees and volunteers may choose between expressing their felt emotions and managing their behaviors to display emotions consistent with organizational or professional norms of behavior. These norms are learned through a process of hiring, training, and reinforcing the desired norms. Research suggests that following the appropriate emotion management expectations has positive outcomes for individuals' participation in organizations as employees or volunteers.

# Empirical Legitimacy and Normative Compliance with the Law

Jonathan Jackson[1], Jenna Milani[2] and Ben Bradford[3]

## Introduction

This entry considers the role that empirical legitimacy plays in motivating people to comply with the law. The first section differentiates between normative and empirical concepts of institutional legitimacy. The second section discusses the criteria that citizens use to judge the rightfulness of court and police power. The third section reviews the motivational influence of legal legitimacy in the context of (a) the sanction independent and content-independent qualities of legitimacy and (b) some ways to broaden the motivational scope of the concept.

## Empirical and Normative Concepts of Legitimacy

When debating the ethical use of political power, philosophers often employ legitimacy as a normatively laden term to describe whether states and state institutions meet certain desirable standards (Hinsch 2008). Whether those who abide by a power structure recognize the moral validity of that power structure is peripheral to the *normative concept of legitimacy*:

> To say that an institutional arrangement is legitimate in the normative sense is not simply to say something about the subjective state of mind of particular individuals. It is to say that the arrangement meets certain substantive requirements – say, standards of justice and rationality expressed in a normative conception of legitimacy – irrespective of whether people believe that they are met or not. (Hinsch 2010: 41–42)

The external observer applies the inherently value-based set of criteria regarding how states and state institutions ought to be arranged for the power to be rightfully held. The external observer also defines those criteria. Consider – for instance – a standard Western democratic conception of the normative legitimacy of justice institutions. On this account, legal authorities would be judged according to principles of independence, transparency, consistency, respect for the rule of law, and so forth. Criminal court systems would need to have effective systems of due process, standards of accountability, oversight over sentencing, anticorruption safeguards, etc.

By contrast, social scientists often employ legitimacy as an empirically laden concept to describe whether – *as a matter of fact* – those that are subject to authority confer legitimacy on that authority (Tyler 2006a, b; Caldeira and Gibson 1995; Gibson et al. 2003; Justice and Meares 2014; Meares 2017). The *empirical concept of legitimacy* (Hinsch 2008) shifts the spotlight to the normative appropriateness of an institution in the eyes of citizens. In this entry we focus on the empirical legitimacy of the courts, police and law, and social scientists typically define the popular normativity of legal authorities along two connected lines (for lively debate, see Hawdon 2008; Jackson et al. 2011; Bottoms and Tankebe 2012: Tankebe 2013; Tyler and Jackson 2013, 2014; Jackson and Gau 2015; Tankebe et al. 2016; Hamm et al. 2017). The first is the right to rule – do citizens believe that a justice institution is moral, just, and proper? The second is the authority to govern – do citizens believe that a legal authority is entitled to dictate appropriate behavior?

The empirical legitimacy of justice institutions is, in short, a matter of measurable public opinion. To quantify the empirical legitimacy of the criminal courts, Tyler and Sevier (2013) fielded in a national public opinion a series of survey questions about normative appropriateness (using survey indicators like "judges generally have the same sense of right and wrong that you do" and "when judges make decisions they almost always

E

behave according to the law") and the entitlement of the courts to make decisions and expect obedience (using survey indicators like "you should support the decisions made by judges even when you disagree with them" and "the courts in your community are legitimate authorities and you should obey them"). On this account, for the criminal courts to be empirically legitimate, citizens need to (a) recognize the normative appropriateness of the institution (the first aspect of empirical legitimacy) and (b) believe that its orders, decisions, and rules should be obeyed because of the *source* rather than the *content* (the second aspect of empirical legitimacy). In a study of Supreme Court legitimacy, Gibson and Nelson (2017) measured *diffuse support* and *due deference* using survey indicators like "if the U.S. Supreme Court started making a lot of decisions that most people disagree with, it might be better to do away with the Court altogether" and "Justices on the U.S. Supreme Court who consistently make decisions at odds with what the majority wants should be removed from their positions."

## Preconditions of Empirical Legitimacy

Who decides what must be present before an institution is deemed to have the right to power? In the *normative concept* it is the external observer who dictates terms. Imagine a group of outside experts, coming together with the goal of deciding what high-level institutional structures and arrangements need to be in place before criminal court systems across the world should be recognized as having moral standing. In the *empirical concept* it is those who are subject to – and beneficiaries of – power who specify how institutions need to act: citizens (a) specify the normative content of legitimation and (b) assess the match between *ought* and *is*. In Tyler and Sevier's (2013) study, research participants were asked whether they believed that courts act in procedurally fair, distributively fair and effective ways (e.g., "how often do the courts treat people with dignity and respect?", "how often do the courts make fair and impartial decisions in the cases they deal with?", and "how often do the courts make mistakes and convict innocent people?"). Tyler & Sevier concluded that people judged court legitimacy in large part on whether court officials follow fair and objective procedures. Fairness was more important than effectiveness, and with regard to fairness, *processes* were at least as important as *outcomes* – that is, people paid particular attention to the presence or absence of fair procedures, to the quality of treatment people receive from court officials, as measured by respect, understanding, and/or helpfulness; and (b) the quality of authorities' decision-making, as measured by voice, neutrality, and transparency (Blader and Tyler 2003).

Whether a justice institution is seen to be legitimate and what constitutes the preconditions of popular legitimacy are both empirical questions. Do people agree on the normative criteria of legitimacy? Residents of deprived communities that have relatively high levels of crime might privilege the effectiveness of the police to deter crime and catch criminals over the extent to which officers wield their authority according to principles of procedural (process) and/or distributive (outcome equality) justice. Equally, members of affluent communities that have relatively lower levels of crime might be more concerned about the fairness of the procedures that the police follow when exercising their authority, since crime is not particularly present in their daily lives. Yet, procedural justice has been shown to be a reliably consistent predictor of police legitimacy across diverse social groups (although see Sargeant et al. 2014; Madon et al. 2016; Murphy 2017). In New York City, Tyler (2005) showed that process-based judgments were stronger predictors of trust and confidence in police than effectiveness and distributive justice for both majority and minority ethnic groups. In a southeastern US city, Wolfe et al. (2016) showed the statistical effect of procedural justice on police legitimacy to be largely invariant across various demographic categories, prior experience of crime and perceived neighborhood conditions. In London, Jackson et al. (2012a) found invariance across a similar set of characteristics, not only in the predictors of legitimacy (procedural justice was again central)

but also in the degree to which legitimacy explained variability in people's willingness to cooperate with the police.
